IMPERIAL INSTITUTE JOURNAL

VOLUME VIII

1905

IMPERIAL INSTITUTE JOURNAL,

1902.

INDEX TO CONTENTS.

ABEL, Sir Frederick, Death of, 261.

Abyssinia—

General Intelligence, 26, 194, 222, 250, 278.
Lecture by Mr. Oskar Neumann, 186.
Transport and Freights, 164.

Acetylene Gas, 212.

Afghanistan—

General Intelligence, 82, 110, 250.

AFRICA, BRITISH CENTRAL—

Commercial Collections, 5, 33, 61, 89, 117, 145, 173, 201, 229, 257, 285, 313.
Customs Tariffs, 134, 162, 246.
Report on, 245.

AFRICA, BRITISH EAST—

Colonisation and Irrigation in, 297.
Emigration, 135.
General Commerce and Industry, 49.
Report on, 299.
Trade Openings, 49.
Trade with India, 21.

AFRICA, BRITISH WEST—

Discussion on (London Chamber of Commerce), 129.
General Intelligence, 26, 54, 82, 110, 138, 166, 193, 306.
Ground Nuts, 221.
Labour Retrospect, 12.
Lecture, by Dr. C. F. Harford-Battersby, 99.
Oil, Palm, 267.
Railways, 303.
Transport, 51.

Africa, French West—

Customs Tariffs, 218, 247.
Financial and Commercial Retrospect, 262.
General Intelligence, 306.

Africa, German East—

Cultivation of Vanilla, 154.
Customs Tariffs, 303.
Labour Retrospect, 179.
Transport and Freights, 191.

Africa, German South-West—

Customs Tariffs, 135.
General Intelligence, 194, 278.
Railway, 219.

African Society, Meetings of, 18, 323.

Africa, Portuguese East—

British Consular Reports, 192.
Customs Tariffs, 190.
Exhibition of Manufacturers' Samples, 397.
General Intelligence, 222, 324.

Africa, Portuguese West—

Contracts, 136, 247.
Customs Tariffs, 190.
Railway, 51.

AFRICA, SOUTH—

Agricultural Retrospect, 66, 235.
Customs Tariffs, 78.
Coal and Coalfields, 271.
Commercial Collections, 5, 33, 61, 89, 117, 145, 173, 201, 229, 257, 285, 313.
Emigration, 330.
Exhibition in 1904, 250.
Financial and Commercial Retrospect, 262.
Forthcoming Events, 270.
General Commerce and Industry, 217, 301.
Harbours, 191.
Irrigation, 66, 329.
Labour Market, 22, 50, 77, 134, 217, 302, 330.
Labour Retrospect, 11, 179, 210, 318.
Tobacco Cultivation, 245.
Trade Notes, 161.
Transport and Freights, 136, 219, 247, 303.

AGRICULTURAL RETROSPECT, 10, 39, 66, 94, 122, 150, 178, 209, 235, 263, 290, 317.

Alaska—

Furs, 24.

Alcohol Duty, Effect on Chemical Industry in England, 211.

Alloys of Copper and Manganese, 212.

Algeria—

British Consular Report, 304.

Alien Immigration—Royal Commission, 22, 106.

Alkali, or Usar land, 127, 294.

Alloys of Copper and Manganese, 212.

Aluminium, 98.

American Market (Transport and Freights), 23, 51, 79, 107, 136, 163, 191, 219, 247, 275, 303, 331.

SOCIETY FOR PROMOTING CHRISTIAN KNOWLEDGE.

THE DAWN OF CIVILIZATION (Egypt and Chaldæa). Fourth Edition, Revised and Enlarged. By Professor MASPERO. Edited by the Rev. Professor SAYCE. Translated by M. L. McCURE. With Map and over 470 Illustrations, including Three Coloured Plates. Demy 4to., cloth, bevelled boards, 24s.; half-morocco (bound by Riviere), 48s.

[This, the fourth of the English Editions of "Les Origines," has been thoroughly revised by the author, who has incorporated into it the results of recent research in Egypt and Mesopotamia, and submitted at the same time the theories founded on these results to a searching criticism. This work and the two succeeding volumes, it may be safely said, are the most important contributions which have ever appeared on the early history of Egypt and Mesopotamia.]

THE STRUGGLE OF THE NATIONS (Egypt, Syria, and Assyria). By Professor MASPERO. Edited by the Rev. Professor SAYCE. Translated by M. L. McCURE. With Maps, Three Coloured Plates, and over 400 Illustrations. Demy 4to. (approximately), cloth, bevelled boards, 25s.; half-morocco (bound by Riviere), 50s.

"The translation by M. L. McCure is, in both cases, excellent. Professor Maspero's presentation of the new learning is at once eminently popular and attractive."—*Times*.

"The author has throughout attempted to reproduce for us the daily life of the various peoples of whom he treats, and in this he has succeeded admirably."—*Academy*.

THE PASSING OF THE EMPIRES (850 B.C. to 330 B.C.). By Professor MASPERO. Edited by the Rev. Professor SAYCE. Translated by M. L. McCURE. With Maps, Three Coloured Plates, and numerous Illustrations. Demy 4to. (approximately), cloth, bevelled boards, 25s.; half-morocco (bound by Riviere), 50s.

"Scholars, as well as unlearned seekers after unbiased facts, owe M. Maspero and Mrs. McCure a deep debt of gratitude."—*St. James's Gazette*.

"An interesting book, and one which will give the reader a good general view of a most eventful period in the history of the world."—*Nature*.

"For some time it must form the standard work upon the subject."—*Pall Mall Gazette*.

"The work is beautifully produced, and the hundreds of illustrations are in the highest style."—*Daily Chronicle*.

THE HOLY GOSPELS. With Illustrations from the Old Masters of the XIVth, XVth, and XVIth Centuries.

[More than 300 works, dealing exclusively with the events of our Lord's life, have been chosen from among the greatest examples of the Italian, German, Flemish, and French schools for the subject of these Illustrations. The work contains 384 (Imperial 4to.) pages, and over 350 Illustrations, 48 of these being separate Plates printed in two tints. Half-bound, paste-grain roan, 47s. 6d.; whole-bound, paste-grain roan, 56s.]

"No more sumptuous edition of the Gospels has ever been produced in English, nor any that approaches this for wealth and beauty of illustrations."—*Church Times*.

"The pictures are, to all who can appreciate religious art, uncommonly beautiful."—*Queen*.

STAR ATLAS. Containing Maps of all the Stars from 1 to 6.5 Magnitude between the North Pole and 34° South Declination, and of all Nebulae and Star Clusters in the same region which are visible in Telescopes of moderate powers. With Explanatory Text by Dr. HERMANN J. KLEIN. Translated by EDMUND McCURE, M.A., M.R.I.A., F.L.S. With Eighteen Maps. Third Edition (R.A. and Dec. brought up to 1900 so far as text is concerned). Revised and Enlarged Imp. 4to., cloth boards, 10s.

THE BIBLE ATLAS OF MAPS AND PLANS TO ILLUSTRATE the GEOGRAPHY and TOPOGRAPHY of the OLD and NEW TESTAMENTS, and the APOCRYPHA. With Explanatory Notes by the late Rev. SAMUEL CLARK, M.A.; also a Complete Index to the Geographical Names in the English Bible by Sir GEORGE GROVE. Sixth Edition. Revised by Sir CHARLES WILSON, K.C.B., K.C.M.G., F.R.S. Royal 4to., cloth boards, 10s. 6d.

[This work has been almost entirely re-written by Sir Charles Wilson, and brought up by this competent authority to date.]

REFLECTED LIGHTS FROM CHRISTINA G. ROSSETTI'S "THE FACE OF THE DEEP." Selected and Arranged by W. M. L. JAY. Small post 8vo., cloth boards, 2s. 6d.

VERSES. By CHRISTINA G. ROSSETTI. Reprinted from "Called to be Saints," "Time Flies," and "The Face of the Deep." Small post 8vo., printed in red and black on hand-made paper, buckram, top edge gilt, 3s. 6d.; limp roan, 5s.; limp morocco, 7s. 6d.

TIME FLIES: a Reading Diary. By CHRISTINA G. ROSSETTI. Crown 8vo., reprinted on hand-made paper, top edge gilt, buckram boards, 3s. 6d.

THOUGHTS BY THE WAY. By the Rev. F. C. WOODHOUSE, M.A., Author of "The Life of the Soul in the World." Crown 8vo., cloth boards, 3s. 6d.

THE CHURCH CATECHISM, with Notes. Illustrated by Twelve Coloured Plates and Thirty-six Cuts in the Text. With Notes by E. M. New and Revised Edition. Small post 8vo., paper boards, 1s.

THE SCRIPTURE AND GOSPEL PICTURE BOOKS in One Volume. With Fifty-eight Page and numerous smaller Illustrations. Small 4to., cloth boards, 2s. 6d.

CHURCH FASTS AND FESTIVALS: Short Papers for Young Children. By the Rev. E. OSBORNE, MAUD CAREW, C. E. MALLANDAIN, and F. E. READE. With numerous Illustrations. Small 4to., cloth boards, 2s.

GOLDEN SUNBEAMS. New Series. An Illustrated Magazine for Children, on Church lines. Adopted by the Sunbeam Mission for circulation among its members. Small 4to., sixteen pages, monthly, 1d. Volume for 1901, containing Twelve Numbers, cloth boards, 1s. 4d.

THE ROMANCE OF SCIENCE: Sounding the Ocean of Air. Being Six Lectures delivered before the Lowell Institute of Boston in December, 1898, by A. LAWRENCE ROTCH, S.B., A.M. Small post 8vo., with numerous Illustrations, cloth boards, 2s. 6d.

THE ROMANCE OF SCIENCE: The Machinery of the Universe. Mechanical Conceptions of Physical Phenomena. By A. E. DOLBEAR, A.B., A.M., M.E., Ph.D., Professor of Physics, Tufts College, U.S.A. Small post 8vo., with several Diagrams, cloth boards, 2s.

MATTER, ETHER, AND MOTION: The Factors and Relations of Physical Science. By A. E. DOLBEAR, A.B., A.M., M.E., Ph.D., Professor of Physics, Tufts College, U.S.A. English Edition, edited by Professor ALFRED LODGE. Illustrated. Crown 8vo., cloth boards, 5s.

"Every page shows that the author is alive to the far-reaching consequences and implications of modern science. Professor Dolbear's pages are eminently readable, and his presentation of the philosophy of modern physics is lucid, interesting, exhaustive, and, for the most part, convincing."—*Literature*.

POISONOUS PLANTS IN FIELD AND GARDEN. By the Rev. Professor G. HENSLOW, M.A., F.G.S., F.L.S. With numerous Illustrations. Small post 8vo., cloth boards, 2s. 6d.

EARLY BRITAIN: Anglo-Saxon Britain. By the late GRANT ALLEN. New Edition. Fcap. 8vo., cloth boards, 2s. 6d.

LITTLE CITIZENS. Written and fully Illustrated by EDITH FARMILLOE. Small 4to., cloth boards, 4s.

"Her sketches are always admirable, and 'Little Citizens' should share in the popularity of her former volumes."—*Globe*, Nov. 6, 1901.

THE CHILD'S PICTORIAL NATURAL HISTORY. Part I. Twelve large Drawings by CARTON MOORE PARK, and descriptive Letterpress. Small 4to. Illustrated paper boards, 1s.

"We can warmly recommend 'The Child's Pictorial Natural History.' Admirably drawn, and would do credit to the most expensive book on natural history."—*Evening Standard*, Nov. 26, 1901.

CHING, THE CHINAMAN, AND HIS MIDDY FRIENDS. By G. MANVILLE FENN. Large post 8vo., with Five Page Illustrations, cloth boards, 5s.

"This is a capital story with a strongly sustained interest."—*Standard*, Nov. 12, 1901.

SELECT FABLES FROM LA FONTAINE. For the Use of the Young. Beautifully Illustrated in Colours by M. B. DE MONVEL. New and Revised Edition. Royal 4to., cloth boards, 6s.

BRITISH BIRDS, SKETCH BOOK OF. By R. BOWDLER SHARPE, LL.D., F.L.S. 272 pages, crown 4to. With Coloured Illustrations by A. F. and C. LYDON. Cloth boards, 14s.

"Briefly, he has produced a most interesting and informing book, which has been admirably illustrated."—*Guardian*.

AMONG THE BIRDS. By FLORENCE ANNA FULCHER. Crown 8vo., cloth boards, 3s. 6d.

EVERY-DAY HEROES. Stories of Bravery during the late Queen's Reign, 1837-1900. Compiled from Public and Private Sources. New and Enlarged Edition. With numerous Illustrations. Crown 8vo., cloth boards, 2s. 6d.

"Is an admirable compilation, which we should like to see widely distributed."—*Guardian*.

THROUGH THE DOOR OF HOPE: A Tale of the Danish Invasion in the Reign of King Alfred. By ANNIE L. GEE. Crown 8vo., with Three Illustrations. Cloth boards, 2s.

CHINA. By Professor ROBERT K. DOUGLAS. With Map and numerous Illustrations. Post 8vo., cloth boards, 5s.

SNAPDRAGONS: A Tale of Christmas Eve and Old Father Christmas. Illustrated by GORDON BROWNE. Small 4to., paper boards, 1s.

THE PEACE EGG, AND A CHRISTMAS MUMMING PLAY. With Illustrations by GORDON BROWNE. Small 4to., paper boards, 1s.

THE STORY OF A SHORT LIFE. With Illustrations by GORDON BROWNE. Small 4to., paper boards, 1s.

JACKANAPES With Seventeen Illustrations by the late RANDOLPH CALDECOTT. Small 4to., paper boards, 1s.

LIBRARY EDITION OF Mrs. EWING'S WORKS.

COMPLETE IN EIGHTEEN UNIFORM VOLUMES.

Crown 8vo., half-cloth, 2s. 6d. each.

THE COMPLETE SERIES, VOLUMES I-XVIII., in cloth case, 48s.

This is the only Complete Edition of Mrs. EWING's Works. The last Two Volumes contain much new matter.

WORKS BY Mrs. MOLESWORTH.

FIVE MINUTES' STORIES. With Coloured Illustrations. Small 4to., cloth boards, 2s. 6d.

A HOUSE TO LET. With Coloured Illustrations. Small 4to., cloth boards, 2s. 6d.

FRIENDLY JOEY, and other Stories. With Coloured Illustrations. Small 4to., cloth boards, 2s. 6d.

OPPOSITE NEIGHBOURS, and other Stories. With Coloured Illustrations. Small 4to., cloth boards, 2s. 6d.

THE CHEAPEST COMPREHENSIVE DICTIONARY IN THE WORLD.

The S.P.C.K. ENCYCLOPÆDIC DICTIONARY,

Consisting of 5,336 pages, Imperial 8vo.,

Is the largest DICTIONARY published—over 200,000 Words. It is an easier, simpler, handier Dictionary than any other, and is an ENCYCLOPÆDIA as well.

DISTINCTIVE FEATURES OF THE ENCYCLOPÆDIC DICTIONARY.

Its comprehensiveness, and its wideness of range in point of time.

"The Encyclopædic Dictionary," by combining in one all these special Glossaries or Vocabularies, effects a double saving, an economy of time and of money.

Its richness and completeness of the illustrative quotations.

Its thoroughly encyclopædic character.

The large number and practical character of its illustrations.

The numerous pictorial illustrations, although eminently artistic in character, are in no sense mere embellishments, but in every case help to elucidate the text.

INVALUABLE FOR THE HOME, THE COLLEGE, AND THE SCHOOL.

In 7 Vols., cloth, 25s.; half-bound, 32s.

ARUNDEL SOCIETY'S PUBLICATIONS.

The Society for Promoting Christian Knowledge have on Sale the Publications of the Arundel Society. The stock includes a large selection of superb Reproductions in Colours and Monochrome of Masterpieces by

GIOTTO.

MASACCIO.

FRA ANGELICO.

BOTTICELLI.

GHIRLANDAIO.

PERUGINO.

MICHAEL ANGELO.

RAFFAELLE.

VAN EYCK.

MEMLINC.

DURER.

And numerous other great Artists.

Hitherto these Publications have, on account of their price, been beyond the reach of persons of moderate means; many are now offered at much reduced prices. The stock is quickly approaching exhaustion, and these pictures, when out of print, are sure to increase in value.

With but few exceptions, these pictures deal with religious subjects.

IMPERIAL INSTITUTE JOURNAL.

VOL. VIII. No. 85.

LONDON.

JANUARY, 1902.

GENERAL NOTICES.

"THE IMPERIAL INSTITUTE JOURNAL."

Fellows resident in the United Kingdom, the Colonies, India, and Foreign Countries, are supplied with the JOURNAL free by post each month.

The Subscription to the JOURNAL from other than Fellows, both at home and abroad, is as follows, including Postage, and Posted Monthly :—

Yearly . . . 8s. 6d. | Half-yearly . . . 4s. 6d. | Quarterly . . . 2s. 6d.

Subscribers to the JOURNAL can have it forwarded by post on each day of publication by payment in advance. Post Office Orders or Cheques should be made payable to the Editor, at the Imperial Institute, South Kensington, S.W., to whom also all communications relating to the JOURNAL should be addressed.

The JOURNAL may also be purchased for **Sixpence** each copy at the Ticket Office of the Institute and at the railway book-stalls of Messrs. WILLING & Co.

The City Agents for the JOURNAL are Messrs. WILLING & Co., 17, Royal Exchange, London, E.C. It may also be obtained at the offices of the printers, WATERLOW & SONS LIMITED, Blomfield-house, London-wall, London, E.C.

Communications respecting Advertisements should be addressed to the ADVERTISEMENT MANAGER, 6, Arundel-street, Strand, London, W.C.

This JOURNAL is distributed (by post) throughout the United Kingdom, India, and the Colonies of the British Empire, and to the following Foreign Countries:—Argentine Republic, Austria-Hungary, Belgium, Bolivia, Chili, China, Colombia, Costa Rica, Denmark, Egypt, France, Germany, Greece, Hawaiian Islands, Holland, Italy, Japan, Mexico, Montenegro, Morocco, Norway, Persia, Peru, Portugal, Russia, Siam, Spain, Sweden, Switzerland, Tripoli, Turkey, United States of America, Uruguay, and Venezuela. The JOURNAL is also placed in the Reading Rooms of CHAMBERS OF COMMERCE, CLUBS, and HOTELS, both at home and abroad.

SPECIAL NOTICE.

MEETING OF THE GOVERNING BODY.

An important meeting of the Governing Body of the Institute, at which His Royal Highness the PRINCE OF WALES, as President, occupied the chair, was held on the 21st ult. A full report of the proceedings will appear in the next issue of this Journal.

THE FELLOWS' DEPARTMENT.

The Reading, Writing, and News Rooms, are open for the use of Fellows every week-day from 10 a.m. till 11.30 p.m., and on Sundays from 3 p.m. to 10.30 p.m. The Library (on the First Floor), is open from 10 a.m. to dusk on Week-days, and from 3 p.m. to dusk on Sundays. The Map Room (First Floor) is open from 10 a.m. to 5 p.m. on Week-days.

The Poste Restante is open every week-day for receipt and delivery of letters and parcels. Letters addressed to initials only are not received, except in reply to notices in the JOURNAL, under "Requirements" Registry. The General Post Office Pillar Box is cleared daily twelve times, between 10.10 a.m. and midnight.

Light refreshments only are, for the present, provided in the Fellows' Rooms and at the bar of the Ceylon Kiosk.

LECTURE AND CONCERT ARRANGEMENTS.

LECTURES.

The second portion of the Lecture Season will begin on Monday, 27th January, when, at 8.30 p.m., the Hon. Sir JOHN A. COCKBURN, K.C.M.G., will deliver a lecture entitled "Federal Fulfilment."

Arrangements have also been made for the delivery of the following :—
"British Columbia," by the Hon. J. H. TURNER, Agent-General for British Columbia.

"The Native Races of the Niger Territories," and "The Obstacles to Development in West Africa," by C. F. HARFORD-BATTERSBY, Esq., M.D., Principal of Livingstone College.

Further particulars with regard to these lectures, and of the fixtures for the subsequent Monday evenings of the Lecture Season, will be announced in due course.

Admission to the Lecture-Hall by the first entrance to the Imperial Institute coming from Exhibition Road.

Seats are reserved for Fellows, who have also the privilege of admitting two Friends for each Lecture, or Address, by reserved seat tickets.

CONCERTS.

The EVENING CONCERTS for Fellows and their friends will be continued during the Winter Season, 1901-2, and will take place in the JEHANGIER HALL on certain Wednesday evenings, the dates of which will be announced in due course.

The following **Concerts** will take place next month :—

Wed., 5th February, 8.30 p.m. CONCERT by the IMPERIAL INSTITUTE (AMATEUR) ORCHESTRA. *Chairman of Orchestral Committee, FRANK H. BUTLER, Esq. Hon. Leader, LOUIS H. D'EGVILLE, Esq. Hon. Conductor, A. RANDEGGER, Esq.*

The programme will include the following :—

SYMPHONY IN B MINOR (unfinished)	Schubert.
BARCAROLA ROMANTICA (For Violin and Orchestra)	A. Randegger, Junr.
Solo Violin	Mr. LOUIS H. D'EGVILLE.
OVERTURE	"Rienzi" Wagner.
JUDEX	From "Mors et Vita" Gounod.
WALSE	"Schatz" Johann Strauss.
PIANOFORTE CONCERTO, No. 2, IN G MINOR, Op. 22	Saint-Saëns.

Vocalist . . . MR. HENRY BOULDERSON.

Wed., 19th February, 8.30 p.m. CONCERT by the STUDENTS of the ROYAL ACADEMY OF MUSIC, under the direction of Sir ALEXANDER C. MACKENZIE, Mus. Doc., LL.D., F.R.A.M.

Fellows have *free* admission to the Concerts, and can purchase tickets (at 2s. 6d. each) for the admission of their Friends.

THE SCIENTIFIC AND TECHNICAL DEPARTMENT.

The Scientific and Technical Department of the Institute has been established to acquire information by special enquiries and by experimental research, technical trials and commercial valuation regarding new or little known natural or manufactured products of the various Colonies and Dependencies of the British Empire and of foreign countries, and also regarding known products procurable from new sources, and local products of manufacture which it is desired to export. This work is carried out with a view to the creation of new openings in trade, or the promotion of industrial developments.

In the extensive and well-equipped series of Research Laboratories occupying the West Corridor of the Second Floor, a staff of skilled Chemists, under the direction of Professor Wyndham R. Dunstan, M.A., F.R.S., carry out the investigation of the chemical constitution and properties of new dye-stuffs, tanning materials, seeds and food-stuffs, oils, gums and resins, fibres, timbers, medicinal plants and products; animal products, minerals and ores, soils, cements, and various other products, with a view to their commercial utilization. Whenever necessary these materials are submitted to special scientific experts, by whom they are made the subjects of particular investigation or practical tests. Reports are also obtained from technical or trade-experts in regard to the probable commercial or industrial value of any such products, whilst full information is collected from official or other trustworthy sources regarding the probable extent and cost of available supplies. All materials requiring scientific or technical examination, or commercial valuation, should be submitted to the Institute for examination either by, or through, the Foreign Office, the Colonial Office, the India Office, or the Board of Trade, or through the Colonial or Indian Government Authorities. Requests for the examination of such materials may also be submitted by Public Commercial Bodies and Institutions of the respective Colonies and Dependencies, or by the Representatives of H.M. Government in foreign countries.

COMMERCIAL INTELLIGENCE DEPARTMENT.

The Office of this Department, in the West Corridor, First Floor, is open daily from 10 a.m. to 5 p.m. (on Saturdays till 1 p.m.), for the purpose of answering enquiries and supplying information relating to the Commerce (Export and Import) and Industries of India and the Colonies. Applications may be made personally or by letter. Special information may be obtained from the Curators in charge of the Indian and of certain Colonial Collections. Arrangements have been made for the translation for mercantile firms of Trade Circulars, Price-Lists, and Catalogues into any Foreign Language, including the conversion of weights, measures and coinages, etc., at cost price, and application for such may be addressed to this Department.

THE COMMERCIAL COLLECTIONS.

The Galleries containing the Colonial and Indian Collections, and the Public Commercial and Industrial News Room, are open for free inspection by the public daily, *except Sundays, and any days specially notified*, from 11 a.m. until 4 p.m. Every information concerning the products, their supply, etc., can be obtained on application to the Curators of the Indian and Ceylon, Canadian, and South African Sections, to the general Curator, and to the Commercial Intelligence Department.

CITY BRANCH OF THE IMPERIAL INSTITUTE.

The City Branch of the IMPERIAL INSTITUTE, at 112, Cannon-street, E.C., is open to Visitors on week-days from 10 a.m. till 5 p.m. The Branch includes a News Room, supplied with many British and Foreign Commercial Publications, Market Reports, etc., and an Enquiry Office in telephonic communication with the Commercial Information Office of the Imperial Institute. The News Room and Enquiry Office are *free* to Fellows of the Institute; other persons are admitted on payment of £1 annually.

Subscribers are entitled to inspect, *free of charge*, any maps or charts included in the Map Room collection at the Imperial Institute, South Kensington, and to consult any works, or official papers, included in the Institute Library.

The Information Department will undertake to obtain analytical or other examinations of samples by competent Experts, upon payment, by persons submitting them, of the usual professional fees, to be previously specified, and agreed to by the applicant. (*For further information see page 20*).

THE NORTHBROOK SOCIETY.

The Northbrook Society is affiliated to the Imperial Institute, and has a special room allotted for the exclusive use of its members in the Institute buildings. Its primary objects are to watch over and promote the interests of natives of India, and to provide a system of guardianship or supervision over such as are sent to Europe for education. The Society is controlled by a committee consisting of an equal number of Governors of the Imperial Institute and members of the Society, presided over by the Earl of Northbrook. It possesses an excellent library. Indian members, who pay no subscription to the Society, have the especial advantage of becoming Fellows of the Institute at half the usual subscription payable by the ordinary Fellows. Applications for membership of the Society should be addressed to the Secretary of the Northbrook Society, Imperial Institute, London, S.W.

IMPERIAL INSTITUTE JOURNAL.

An ornamental Cloth Cover, for binding the numbers of the JOURNAL for the year 1901 into one volume, may be obtained at the TICKET OFFICE of the INSTITUTE, or from Messrs. WATERLOW AND SONS LIMITED, Blomfield-house, London-wall, E.C., price 2s. 6d. An index and title-page to the volume are inserted in this issue of the JOURNAL. Bound volumes of the JOURNAL for the seven years, 1895-1901, may be had at 10s. each.

LIVERPOOL, ENGLAND.

FINANCIAL AND COMMERCIAL RETROSPECT.

UNITED KINGDOM.—The Board of Trade Returns for November record decreases both in the imports and the exports as compared with the same month of 1900, though in the re-exports of foreign and colonial merchandise, valued at £5,079,601, there was an increase of £66,346. The number of working days was the same in the two months, and the smaller figures are largely explicable by the lower prices ruling. Among the imports, which at £46,810,553 showed a diminution of £2,923,177 or 5·8 per cent., there were decreases in almost every class of article. The largest percentage increases were in living sheep and lambs for food, the number of which was nearly 2½ times greater than in November, 1900, while their value rose in almost equal proportion; in rice, the quantity of which was doubled and the value better by 83·9 per cent.; in coffee, the amount of which increased 74·7 and the value 36·1 per cent.; in hemp, which rose 46·3 in quantity and 42·7 per cent. in value; and in cheese, of which 38·2 per cent. more was received though its value only increased 19·9 per cent. In cereals, larger supplies from Roumania, the United States, British East Indies, Australasia and Canada increased the quantity of wheat by 9·1 per cent., but the value was only fractionally higher. Wheat flour was slightly less in quantity, but barley showed an important improvement owing to larger shipments from Roumania and Russia, the imports rising 31·3 in quantity and 15·4 per cent. in value. Oats improved slightly in quantity and still more so in value (15·4 per cent.), but, on the other hand, Indian corn fell off seriously—34·3 in quantity, and 24·4 per cent. in value—largely owing to the small supplies from the United States, which were only 574,800 cwt., compared with 3,397,300 cwt. in the preceding November. Refined sugar did not alter much in quantity, but its value was 13·8 per cent. less, while in raw sugar the value declined by 41·4 per cent., the quantity being less by 28·5 per cent. Tea fell off by 22·3 per cent. in amount, and 25·7 in value, while in unmanufactured tobacco there was a decline in both respects of about 4 per cent., though manufactured tobacco showed an improvement. Raw cotton rose by 255,215 cwt., but its value was less by £219,692 (2·9 per cent.); the imports were larger from Egypt, the United States and Brazil, but smaller from the British East Indies. Cotton manufactures slightly declined in value. Flax, jute, raw silk and sheep's wool were all less, the value of the last diminishing by £189,492 and its quantity by 4,695,259 lb., in spite of larger shipments from British South Africa. In hewn and sawn wood there was again a heavy falling off—31·1 per cent. in quantity, and 35·9 per cent. (nearly three-quarters of a million sterling) in value. In spite of a decrease in quantity to the extent of 8·2 per cent., copper improved slightly in value. The exports of British and Irish produce were worth £22,842,436—a decrease of £1,782,213 or 7·2 per cent. A large portion of the decrease was accounted for by the reduction in both the quantity and the price of coal. All countries, except Italy and India, took less, especially France, with the result that the exports were less by 587,431 tons (14·4 per cent), while the value fell £1,359,637 (or 37·9 per cent). In iron and steel there was a falling off in quantity of 18,303 tons (6·9 per cent.), and in value of £332,267 (or 13·4 per cent.). The value of machinery declined £203,517 (or 12·0 per cent.), although there was a slight improvement in locomotives, sewing machines, and mining machinery. In new ships built for foreigners there was a fall of £366,291. Copper increased by 32·3 per cent. in quantity, and 23·6 per cent. in value. Increased demand for cotton twist from Germany, Turkey, China, Japan and the British East Indies increased the quantity by 28·6 per cent., but the value was only better by 12·4 per cent. In cotton piece-goods there was an increase of nearly 16 million yards; India took less, but China took 30 million yards, and British South Africa 3 million yards, more than in November, 1900. The fall in prices, however, was such that the value was only 1 per cent. better. In other cotton manufactures the fall in value was 4·1 per cent. Wool was 29 per cent. less in quantity, and 44·7 less in value; woollen and worsted yarns and woollen tissues were also less in both respects, though to a smaller extent, but worsted tissues increased 20·3 per cent. in amount, and 4·7 in value. Chemicals, with the exception of copper sulphate, were higher in value. Chemical manures increased 8·5 per cent. in quantity, and 9·4 per cent. in value, and soda compounds 32·8 per cent. in the former respect, and 24·7 per cent. in the latter.

In the course of last month the North Eastern Railway Company announced that, for the future, it will adopt an important innovation in the method by which its traffic statistics are compiled. Hitherto British railways have only published the number of train-miles run, and the number of passengers carried, and have not compiled, even for their own use (with one possible exception), those particulars as to the number of passengers and tons of goods carried one mile ("passenger-miles" and "ton-miles") which are furnished as a matter of course by the railways of other countries, and are generally regarded, except in Great Britain, as indispensable to the proper and economical management of a railway's traffic. Henceforth the North Eastern will be an exception to this British rule (though it may be hoped that it will not long retain this particular monopoly), and will for the future have these units regularly worked out, and will use them as the basis for the operation of the line.

COLONIES.—The report of the Customs Department of the Dominion of Canada for the year ending on June 30 last has just been issued. It states that the aggregate of the imports and exports of the Dominion in that period

was \$386,903,157, or \$5,385,921 more than in the preceding year. By far the larger portion—\$331,000,000—was with the United States and Great Britain, the share of the former being \$183,000,000, and of the latter \$148,000,000. The next countries in order were Germany, which sold about \$2,000,000 of goods to Canada and purchased over \$7,000,000; France, which purchased \$5,000,000 and sold \$1,500,000; Belgium, which purchased \$3,800,000 and sold \$2,800,000; and the West Indies, which took \$2,905,000, and sent \$1,801,000. With China and Japan the total trade was worth over \$3,000,000, with Newfoundland a little under \$3,000,000, and with Australia \$2,311,000, the great bulk of the transactions with the two latter being purchases. The percentage of duty on the total value of the goods imported was 16·06, against 15·98 in the preceding year.

The number of mines on the Witwatersrand at which resumption of working is being allowed is steadily increasing, but as yet the results scarcely seem commensurate with the number of stamps that have been started. The yield of gold for November was 39,075 oz., less than a twelfth of the highest output recorded, which was in August, 1899, just before the outbreak of hostilities. In October last it was 33,393 oz. However, there has been a distinct re-awakening of interest on the London Stock Exchange in the South African mine market, and prices have already improved generally. The Rhodesian output is slowly rising. That for November—16,487 oz.—was the highest yet recorded, being nearly two thousand ounces better than in the preceding month, and nearly six thousand ahead of the return for the first month of last year. The November yield in New South Wales was 34,293 oz., valued at £113,528—a large improvement on that for the same month of the preceding year, which was only 12,579 oz., valued at £43,587. In Victoria the output was 53,426 oz., while in West Australia 85,324 oz. were entered for export and 89,157 oz. received at the Perth Mint; this total of 174,481 oz., valued at £671,753, compares with 146,635 oz. in November, 1900. In New Zealand the yield was 39,185 oz., valued at £149,680, against 19,739 oz., valued at £70,957 in the preceding November.

The following table shows the variations which have occurred in certain Colonial Government securities during the past three months:—

	29th Oct.	28th Nov.	30th Dec.
Canada 3 per cent. . . .	100½-101½	101¼-101¾	101¼-101¾
Cape 3 per cent. . . .	93½-94½	93½-94½	95-95½
Natal 3 per cent. . . .	93½-94½	93½-94½	94-95
New S. Wales 3 per cent. . .	94½-95½	94-94½	95½-96
New Zealand 3 per cent. . .	96½-97½	93¾-94¼	94½-95
Queensland, 3 per cent. . .	91½-92½	93-93½	93¾-94¼
South Australia 3 per cent. .	92½-93½	92¾-93¼	93¼-93¾
Tasmania 3½ per cent. . .	103½-104½	103½-104½	103½-104½
Victoria 3 per cent. . . .	95½-96½	95¾-96¼	96¼-96¾
West Australia 3 per cent. (May-Nov.)	91½-92½	91½-92½	92½-93½

INDIA.—The report of the Burma Railways Company for the year ending in June last shows that the receipts were Rs. 11,632,642, against Rs. 10,062,592 in 1899-1900, while the expenditure was Rs. 6,563,241, against Rs. 5,602,901. The net revenue of Rs. 5,069,401 thus showed an improvement of Rs. 609,710. The working expenses were 56·42 per cent. of the gross receipts, against 55·68 per cent. The mileage open for traffic at the end of the financial year was 1,177 miles, and the mean mileage for the year was 1,128, against 997 in 1899-1900. The goods carried increased in weight from 1,168,178 to 2,357,567 tons.

The fluctuations which have occurred in the securities of seven leading Indian Railway Companies are shown in the subjoined table:—

	29th Oct.	29th Nov.	30th Dec.
Bengal and North Western . .	126-130	129-133	127-131
Bengal-Nagpur Gua. 4 per cent. .	104-108	105-109	106-110
Bombay, Baroda & Cent. India .	168-173	170-175	171-176
Indian Midland 4 per cent. . .	105-109	106-110	106-110
Madras Grntd. 5 per cent. . .	133-137	138-143	134-138
South Indian 4½ per cent. Deb. .	138-143	138-143	136-141
Southern Mahratta 3½ per cent. .	106-110	107-111	107-111

FOREIGN COUNTRIES.—In the German Budget Bill, as laid before the Reichstag at the beginning of last month, the estimates of revenue and expenditure balanced at 2,349,742,456 marks. The revenue, however, fell short of the expenditure by nearly 59 million marks, and to make good the deficit it was proposed to increase the matricular contributions, so as to yield 24 millions more, and to provide for the remaining 35 millions by a supplementary loan. Credit operations to the extent of 182,058,945 marks were authorised by the Bill to meet various items of non-recurring expenditure. In Italy the Treasury Minister in his financial statement could point to various signs of the increasing prosperity of the country. The Budget for the past financial year showed a surplus of income over expenditure of £1,648,000, exclusive of £300,000 spent in the redemption of debt and £720,000 devoted to railway construction, while for the current year the surplus is estimated to amount to £500,000. There are satisfactory yields in almost every branch of revenue. The floating Treasury debt has been reduced by £2,500,000 within the last three years, and the metallic reserve has been increased to 50 per cent. of the total note currency, while Consols stand at par and the gold premium has fallen to 2¼ per cent. In the Japanese Budget, the ordinary expenditure appears as 177,500,000 yen, and the ordinary revenue as 225,000,000 yen. The surplus, together with 38,000,000 yen obtained by the sale of Chinese new indemnity bonds and 15,500,000 from the old Chinese indemnity and other sources, it is proposed to devote to the redemption of national debt, building railways and telegraphs, and restoring the naval maintenance fund. These proposals, however, do not meet with universal approval, one objection urged being the inclusion of all the new indemnity in one year's revenue. The proposals put forward by the Portuguese Government for the reorganization of their debt were rejected by the Council of Foreign Bondholders. The proposals provided, among other things, for a reduction in the principal of the debt to the extent of 52½ per cent. for the 3 per cent. debt, 33½ per cent. for the 4 per cent. debt, and 25 per cent. for the 4½ per cent. debt, while for the balance new

bonds were to be issued bearing 3 per cent. interest, so that each £100 of present bonds would receive £1. 8s. 4d., £2, and £2. 5s. respectively. A French loan was issued on December 21 for 265 million francs, the amount of the indemnity payable to France by China. Professing its inability to pay the money in a lump sum, the Chinese Government has been allowed to liquidate it in 66 half-yearly payments. The French Government, for various reasons, wants to have the money in hand immediately, but instead of issuing a loan on the security of the Chinese payments, it has elected to issue an equivalent amount of new Rentes ranking with the present three per cents. But it is also desirous not to increase the total of its debt, and has therefore arranged to use the Chinese indemnity annuities to redeem an equivalent amount of existing Rente held by the savings banks; this is to be converted into annuities payable in the 33 years by half-yearly redemptions, these annuities to be taken over by the savings banks. The loan was covered something like 25 times over.

AGRICULTURAL RETROSPECT.

UNITED KINGDOM.—Heavy rains in the first week of December made up to some extent the deficiencies of November, and anxiety as to the water supply in country districts was set at rest. Severe frost was experienced during the week before Christmas, but there was no sign of injury to young crops, which were particularly robust for the period of growth. The effect of the frost upon the land could not have been anything but beneficial, and, in addition, the firmness of the ground facilitated the work of manuring. There was a considerably smaller area under wheat in the United Kingdom last year, according to the final returns of the Board of Agriculture, though the total yield of that cereal, as well as of barley, was practically the same as in the previous year, owing to an increased production per acre. In 1900 the yield of wheat in England was 28·4 bushels; last year it was 30·8 bushels, or slightly more than the average of ten years, which is 29·9. In Scotland the yield was much higher last year—39 bushels to the acre, against 36·4 in 1900, and an average of 37 bushels for the past ten years. The Welsh yield was 24·6 bushels to the acre, slightly more than the average. In Wales, however, as well as in Scotland, a very small area is under wheat. The barley yield last year was distinctly below the average—30·3 bushels in England against an average of 33, 29·6 bushels in Wales against an average of 30·25, but 36·3 bushels in Scotland compared with 35·7 as the average. The oat crop showed the greatest falling off, the yield being 37 bushels, or 3¼ bushels less than the average. The Chambers of Agriculture have signified their approval of the recommendations of Sir Herbert Maxwell's Committee on the use of preservatives and colouring matter in food, one of the most important of which is that all such foreign substances shall in future be excluded from milk offered for sale in this country.

The first annual report of the Department of Agriculture and Technical Instruction in IRELAND is published. It deals with the history of the Department from its establishment on April 1, 1900, until the end of March, 1901. Two principles have, it is stated, guided the Department in its policy—first, the principle of evoking and fortifying the self-reliance, enterprise, and sense of responsibility of the people; and, secondly, the principle of preventing, by a due conservation of central direction, this free play of local initiative and responsibility from leading to an indiscriminate multiplication of unrelated local schemes. The chief work done in the Agricultural Department was the formulation of the schemes for the improvement of live stock. Under the horse scheme, 298 thoroughbred and 112 agricultural stallions were offered for registration, and of these 97 and 31 respectively were placed upon the Department's register. Upwards of 1,800 free nomination tickets of £3 each were offered at 150 shows held throughout the country during March and April, and nearly 1,700 of these tickets were issued. The schemes for encouraging improvements in the breeds of cattle provided for premiums of £12 each to approved pure-bred yearling and two-year-old bulls of any breed selected by the County Committee. Loans to the amount of £2,036 have been made to 61 persons to enable them to buy good stallions and bulls. In addition, out of the funds placed at the disposal of the Live Stock Committees from the local rate and the Department's contribution, a sum of £4,276 was allocated towards awarding premiums and prizes to female stock as a further means of encouraging improvements in stock-breeding. The total amount of money ear-marked for the schemes for improvement in the breeds of sheep and swine amounted to £23,983. Cork and Mayo were the only counties which did not adopt the schemes. The Department contributed just over half the sum named, the remainder being provided out of the local rates. In addition to the preparation and promulgation of the live-stock schemes, the practical work of the

Department upon its agricultural side has been the carrying out of certain agricultural experiments and scientific investigations, with the double object of demonstrating facts regarding the manuring of land and the use of varieties of crops, which, however well known to scientists, are not generally known to the smaller farmer, and of discovering how far, if at all, these principles require modification when applied to the soils and climate of Ireland. It has been decided that, as soon as possible, one or more itinerant instructors should be appointed to give practical and technical advice in each county on tillage farming, dairying, poultry rearing, fruit cultivation, bee-keeping, and other subjects, and several counties have already appointed such instructors.

COLONIES.—The report of the Colonial Secretary of TRINIDAD for the year 1900 shows considerable prosperity in the colony, in spite of the export of sugar being the smallest for twenty years past. Cocoa is now the staple product; the area under its cultivation is nearly twice that under sugar, and is extending daily. Cocoa, however, is not, like sugar, a manufacture, and a given quantity of it represents far less expenditure on wages than is the case with sugar; but it maintains a larger number of peasant proprietors. As to the sugar industry, the old system of a boiling-house attached to each plantation has passed away; the planter is now primarily a manufacturer, and cane farmers have come into existence who do nothing but grow the cane and then sell it to the mills. The farmers are, in many cases, peasants with only a few acres cultivated by themselves and their families.

The annual report on the affairs of the LEEWARD ISLANDS records no improvement in the condition of the sugar-growing islands of Antigua, St. Kitts-Nevis, and Montserrat. Dominica, however, whose staple products are now cocoa and limes, is enjoying a steadily increasing prosperity. Much depression is felt in ANTIGUA and ST. KITTS-NEVIS, owing to the short cane-crop and the severe drought experienced. The erection of central factories as the sole hope of restoring the sugar industry of Antigua, St. Kitts-Nevis, and Montserrat, has been so fully discussed that further advocacy would appear to be but repetition. The antiquated machinery and the obsolete methods now employed in the manufacture of sugar in these islands should, years ago, have been replaced by modern factories, but, year after year, no improvement takes place, the crops become shorter, and hundreds of acres of what were formerly valuable cane lands are now thrown out of cultivation. The export of sugar for the colony in 1900 exhibited a decrease of 7,431 tons as compared with the previous year. DOMINICA's prosperity may justly be ascribed to a steady growth in the various industries and to the gradual development of the island's resources. The exports of cocoa, in particular, were double those of ten years ago, while the output of limes and their products has increased three-fold during the same period. Dominica has, for years, been the world's chief producer of lime-juice, and the area under cultivation of limes is being largely extended. Sugar has fallen to the rank of a very minor product, while the manufacture of rum is now not even sufficient for local requirements. The export of fruit is assuming considerable proportions, and the cultivation of oranges, pineapples and bananas is attracting the attention of small capitalists.

The following information relating to agriculture in QUEENSLAND is taken from the report just received of the Agricultural Department. The figures relating to wheat are very encouraging. The area under that crop for grain rose from 52,527 acres in 1899 to 79,304 acres in 1900; the quantity yielded rose from 614,414 bushels to 1,194,088 bushels; the average yield per acre from 11·70 bushels to 15·06 bushels; and the money value from £92,162 to £179,113. In 1900 only 77 acres showed signs of rust, as against 5,610 acres in 1899. It is to be noted that during the last 15 years the acreage of land under wheat in Queensland has increased sevenfold; but there is room for even greater development, as the colonists do not produce more than a third of the wheat they consume. As regards dairying, none of the agricultural pursuits in Queensland seem to have made more rapid or enduring progress. In 1900 there were at work 53 butter and cheese factories and 146 creameries, employing 595 persons. The output that year was 3,875 tons of butter and 886 tons of cheese, valued altogether at £658,177. Of that quantity of butter, 620 tons were exported, as against 517 tons in the preceding year. The allied industry of ham and bacon curing seems to be in a similar healthy condition; the exports of bacon and hams in 1899 were valued at £31,067 and in 1900 at £45,831. Turning to fruit-culture we read that, thanks to the efforts of the departmental experts, fruit-growing is being established on a satisfactory basis in Queensland. Superior and suitable varieties are being cultivated. Insect and fungus pests are being encountered with the most effective remedies. Of grapes the production increased from 3,230,627 lb. in 1899 to 3,634,949 lb. in 1900. The area under bananas increased from 5,802 acres to 6,215 acres; under oranges, from 2,324 acres to 2,882 acres; under mangoes, from 245 acres to 411 acres; under strawberries, from 87 acres to 121 acres; under apples, from 132 acres to 238 acres. The value of the exports of fruit increased from £93,187 to £104,385. In NEW SOUTH WALES the wheat crop is estimated by the Government Statistician at 19,000,000 bushels, being an average of 12·8 bushels per acre, from an area of 1,470,400 acres. This is two full bushels per acre higher than the average of the last ten years.

From the final report of the ONTARIO Bureau of Industries on the crops of 1901, it appears that all but hay were smaller than they were estimated at first, and all but barley and hay are put below average. The crop of winter wheat yielded 16,017,029 bushels, or an average of 17·4 bushels per acre compared with an average for the past ten years of 20·2. Spring wheat yielded 5,498,751 bushels, or 15·4 bushels per acre (decennial average 15·5). Barley yielded 16,761,076 bushels, or 26·3 bushels per acre (decennial average 26·1). Oats yielded 78,334,490 bushels, or 32·5 bushels per acre (decennial average 34·9). Peas amounted to 10,089,173 bushels, or 16·7 bushels per acre, and 4,632,317 tons of hay were produced, with an average of 1·81 tons per acre. The attacks of the Hessian fly had a serious effect upon the wheat crop, and injured barley to a less extent. The area of land sown with wheat in the autumn was greatly reduced, in consequence of the fear of this pest. The important apple crop of Ontario is a very small one. The final crop bulletin of the MANITOBA Government for the past year shows a total yield in cereals of 85,000,000 bushels from

an area of 3,000,000 acres sown. The yield of wheat amounts to 50,500,000 bushels, being an average of 25 bushels per acre. This is a record yield for the province. The wheat crop in the North-Western territories exceeds 15,000,000 bushels.

INDIA.—The first general report on the rice crop of Bengal, Madras, and Lower Burma, issued by the Statistical Department of the Government of India, makes the total area sown with autumn and winter rice 46,545,900 acres, or 236,300 acres more than was harvested in 1900, but 33,600 acres less than that of the crop of 1899. In Bengal, where about four-fifths of the crop is grown, a yield close to the average is anticipated for autumn and winter rice alike. In Burma some damage has been done by floods, but prospects on the whole are favourable, while in Madras, if the rest of the season proves suitable to the maturing of the crop, an average yield may be expected. Reports from the cotton-growing districts of India, though not unfavourable, are not so good as for the same period last year. In the Punjab the area sown is now estimated at 1,074,100 acres, or about 12 per cent. below the exceptionally large area of last year. In the North-Western Provinces and Oudh the area sown is estimated at about 5 per cent. below the normal. In the Central Provinces 1,007,857 acres have been sown, an area considerably above the average. The crop is generally backward, but the out-turn is expected to be only a little short of the normal. The area under cotton in Berar is reported to be 2,628,000 acres, which is 6 per cent. in excess of last year's estimate, and 17 per cent. above the average of the last five years. In Bombay there are 1,101,500 acres under the early crop in the Deccan, this being 4 per cent. below the average. The areas in the other provinces are reported as follows:—Sind, 87,000 acres, or 7 per cent. below the average; Madras, 464,500 acres, or quite 25 per cent. below the average; and Burma, 108,712 acres.

FOREIGN COUNTRIES.—A report issued by the Ministry of Agriculture of ARGENTINA estimates the area of the wheat crop at 3,296,066 hectares, or 8,141,283 acres, as compared with 8,347,980 acres for last year, showing a decrease of 206,697 acres. These figures represent the area sown, on much of which, this season, the crop has been destroyed. Probably the total is an outside estimate, as, according to the *Standard*, the Provincial Agricultural Department of Buenos Ayres, in a report issued to counteract pessimist statements, puts the area in that province at 61,105 acres less than is given in the account published by the Central Ministry of Agriculture. In examining the returns of agricultural exports from the Argentine Republic in the first nine months of 1901, and comparing them with the figures for the corresponding periods of the two preceding years, it is seen that, over the three periods, live cattle and live sheep have been exported from the River Plate in continually decreasing quantities, while the exports of frozen mutton, frozen beef, and butter have undergone continuous expansion. Comparing the first three quarters of 1901 with the corresponding period of 1900, we find increases of 2,180 tons of frozen mutton, 16,336 tons of frozen beef, 5,554 tons of jerked beef, 94,889 tons of wool, 416,671 tons of maize, 130,679 tons of linseed, 183,033 lb. of butter, and 1,635 lb. of cheese. Coincident with these we get decreases of 16,653 head of cattle, 171,862 sheep, 904,855 tons of wheat, and 17,920 tons of hay. The marked decrease in the exportation of live animals dates back to the early half of 1900, when the British ports were closed on account of the appearance of foot-and-mouth disease in Argentina. However, whilst the exports of sheep have dwindled to one-twentieth of their dimensions two years ago, those of cattle have not declined even to one-third. There is a revival in the trade in jerked beef (*tasajo*), an article which is sent to neighbouring South American countries. The wool shipments from Argentina are irregular, the present export being more than twice the quantity in 1900. Exports of butter continue to expand slowly but continuously, but those of cheese are at present insignificant. As regards grain supply, Argentina is erratic; the quantity of wheat shipped last year was less than half as much as in the previous year, whilst nearly double the quantity of maize was exported. Most of the exports of hay—lucerne, or alfalfa—come to this country, and the quantity does not vary much from year to year.

LABOUR RETROSPECT.

UNITED KINGDOM.—During the past year a backward movement has been apparent in many important branches of industry. The retrogression has taken place slowly, but nevertheless steadily, and in the closing month of the year was noticeable in the shipbuilding industry, in iron and steel manufacturing, and in the engineering and metal trades generally, in all of which branches an unusual number of men were out of work. Employment in coal-mining was not so good, but wages in South Wales, although showing a fall of $7\frac{1}{2}$ per cent. on twelve months ago, are still more than 60 per cent. above the standard. In the engineering trades, relations between employers and employed remain on an amicable basis, as it has been arranged that the working agreement arrived at after the great strike should, with a few modifications, continue in force. Some of the Scottish steel companies have announced their intention of extending holidays to one month, in consequence of the slackness of trade. The cotton industry is in a better position than it was at the beginning of last year. Information for November respecting factories employing about 78,000 women and girls shows that 94 per cent. of those in spinning mills, and 71 per cent. of those in weaving factories were working in factories giving full employment throughout the month, to be compared with 84 and 71 per cent. respectively in October.

Sir Edward Fry's award in the Grimsby fishing dispute has been issued. It will be remembered that for the chief engineer the men demanded 38s. per week and poundage at 4d. in the pound of net profit. The owners offered 34s. and a poundage of 3d., food being assumed in all cases. Sir Edward

Fry awards 34s. with poundage at $3\frac{1}{2}$ d. For the second engineer the demand was 30s. with 3d. poundage, the offer was 27s. with 2d. poundage, and the award is 27s. with $2\frac{1}{2}$ d. poundage. For the third hand the demand was 23s. with 2d. poundage, the offer was 20s. with 2d. poundage, and the award is 20s. with poundage at $2\frac{1}{2}$ d. There is no doubt that the method of payment favoured by the arbitrator is best calculated to make the men do their work efficiently. One strong point which the share fishermen (skippers and mates) made was with regard to signing on, as they objected to this taking place at the Federation offices. Under the award, all men must sign on at the Board of Trade office for the protection of the masters, as they must sign off at the same office for protection against the masters. Sir Edward Fry goes very carefully into the numerous duties of the hands employed, and his ruling on the various points appears to have given general satisfaction.

COLONIES.—In AUSTRALIA, two measures of importance to labour have just become law. The Alien Immigration Restriction Bill, some of the clauses of which have provoked much discussion, has passed the Commonwealth Parliament. The other, which deals with industrial arbitration, has been passed by the NEW SOUTH WALES Legislature. The latter is considered to be the most resolute and consistent attempt yet made to deal with disputes between capital and labour, because it not only compels a reference of all such disputes to a competent court with power to enforce its orders and awards, but it makes a strike or a lock-out before such reference or during its pendency a misdemeanour punishable by fine or imprisonment. Every industrial dispute—a phrase which is defined in terms which include every possible matter which can arise between an employer and his workmen—can be referred to the Court either by the industrial union interested or by the registrar. Orders of the Court may be enforced, as in New Zealand, by injunction or by fines and penalties levied on the corporate funds of the union and on individual members, but they are also enforceable by a totally new method—namely, the declaration of a common rule. This gives the Court power to declare that any practice, usage, condition of employment, or industrial dealings, shall, with such limitations and exceptions as the Court may declare, become a common rule for all persons employed in the industry which is under review. This authority will be a most powerful instrument to compel obedience to the decree of the Court, and upon its efficacy will probably depend the success or failure of the whole measure. The Court has also power to declare a standard wage. The lasting effect of the drought in QUEENSLAND is shown in the latest report of the Labour Bureau. It attributes the increase in the volume of unemployed labour to the effects which the prolonged drought had upon the pastoral and kindred industries. While the drought lasted, however, many hundreds of men found employment travelling stock, or providing emergency feed, etc. Nearly all these men were thrown out of work by the break-up of the drought. In order to cope with this difficulty the Government decided to have certain authorised railway lines constructed by day labour instead of contract. In July, 1901, 1,100 men were being employed, either at day wages or piece-work, upon certain selected lines. The Queensland Government has issued a formal appeal against the Pacific Islands Labourers Bill, on the following grounds:—That the provisions of the bill are in direct conflict with the principle laid down by Mr. Chamberlain, that legislation imposing disqualifications on account of race and colour is contrary to the general conceptions guiding British rule throughout the Empire; that the Bill provides for the forcible expulsion of many persons whose original coming to Queensland was lawful, and who have for many years enjoyed the protection of British laws; and that the provisions of the Bill will inflict a grievous wrong on the State of Queensland as distinguished from the rest of the Commonwealth.

Mr. Cecil Rhodes has made public some valuable opinions concerning land settlement in SOUTH AFRICA—a question upon which he is well qualified to speak. He favours the adoption of some scheme by which a portion of the Yeomanry could be retained in the country, and suggests that offers should be made to the present troops of a yearly capitation grant of, say, £25 per man, and, perhaps, a horse allowance of £12 per year, to those who would remain in the country and serve when called upon for its defence. They should receive land in one of the irrigation colonies, the extent of an allotment to be in accordance with its productive capacity, such allotment to be sufficient to maintain a family in comfort, with communal grazing over the balance of the land owned by the settlement. Mr. Rhodes, in discussing the details, points out that the scheme is not a vast one, as, taking the maximum at 4,000 men, the 2,000 allotted to the Transvaal would require only sufficient irrigated land as would support each family in comfort, the balance being merely communal grazing. In the Free State practically the whole strip along the Basutoland boundary, termed the "Conquered Territory," is capable of being put under the plough. In the meantime, it is cheering to hear that more mines on the Rand are getting to work, the Commander-in-Chief having sanctioned the dropping of 100 stamps weekly up to 15th January. It is hoped that by the end of February one-fourth of the mines will be re-started. A revision of the regulations governing native labour has been under consideration for some months, and the new enactments have now been drawn up. Between a desire to support the gold industry and, at the same time, to protect the native labourer, these regulations appear to strike a happy mean. It is provided that all labour agents and compound overseers shall first obtain a licence, so that when the native enters into a contract of service, he will be safeguarded against coercion and fraud. A feature of the new regulations is

the absolute prohibition of the supply of liquor to natives, under the severest penalties. Inspectors of mines will be provided, whose duties will be to guard the interests of the natives, and to investigate matters relating to contracts and wages, from which regulation no one will be allowed exemption. The duration of contracts will not exceed one year, except with the approval of the Native Commissioner himself.

The Emigrants' Information Office has collated a number of practical notes and much good advice with regard to our WEST AFRICAN Colonies, and, after revision by the Governments concerned, has issued this information in pamphlet form. The territories dealt with are Gold Coast, Sierra Leone, Lagos, Gambia and Southern Nigeria, and the dominant note throughout is that the whole region is quite unsuited for colonisation by European settlers, as the climate renders continuous residence on the coast almost impossible. There is employment for a certain number of lawyers and doctors, but the openings for white labour generally are few. The mines require miners, and the mercantile firms need assistants, but all these men are sent out by appointment from England. Professional men should first make careful enquiries as to prospects from experienced residents before going out. West Africa is only suitable for persons of sound constitution and temperate habits, and every one should be medically examined before deciding to go there. It is not desirable that anyone under 22 years of age should go out to the West Coast.

INDIA.—A retrospective glance at the industries of India last year reveals a somewhat better condition of affairs than that which prevailed in 1900. There has been a recurrence of famine, but distress from this cause has not been so widespread, the Bombay Presidency being the chief sufferer. As against the depression in agricultural pursuits, it is satisfactory to note that India's mineral wealth is becoming more and more developed, and that a considerable progress in her manufacturing industries has taken place. Much has been done by the Government in the interests of labour. In the Assam Labour Bill, a praiseworthy attempt has been made to improve the condition of the coolies without placing too great a burden on the tea industry. The labour clauses of the Indian Mines Act have been revised in a satisfactory manner. By the investigations of the Famine Commission and of the Plague Commission, the authorities should be better able to safeguard and relieve the natives in the time of future visitations, and it is to be confidently hoped that the new year will be one of further improvement and progress.

FOREIGN COUNTRIES.—It has been stated in more than one of the American trade journals that the great steel trust has determined on a new policy with regard to the labour they employ. They contemplate substituting American men and boys for the foreigners, and particularly the Welsh tin-workers, who now take such a large share in operating the big mills of the country. It is doubtful if immediate action will be taken in this direction, but the matter is under serious consideration. It has been found, particularly in time of strikes, that the illiterate foreigner is a hard proposition to handle, and it is believed that the American labourer and the skilled mechanic can be dealt with more easily. Although it may mean a great increase in the rate of wages now paid, the companies can afford to pay more if they are insured against constantly recurring troubles with the men. As the result of a convention, recently held in New York, a committee has been appointed, consisting of twelve representatives of organised labour, twelve representatives of labour-employing concerns, and twelve independent gentlemen, in order to consider the question of harmonising capital and labour and averting strikes. This committee has much in common with the Courts of Arbitration and Conciliation in the North of England, and declares in its programme that it will undertake such work as may seem necessary to promote industrial peace, to be helpful in establishing rightful relations between employers and workers, to endeavour to obviate and prevent strikes and lock-outs, and to aid in renewing relations wherever a rupture has occurred. The committee assumes no power of arbitration unless conferred by the parties to the dispute.

The British Consul at Stuttgart, referring to the present depression in GERMAN trade and industries, says that the chief failures in Germany during the last 18 months have been those of banks, and not of factories and works founded on a sound basis. In spite of the general depression there are several favourable symptoms. Thus, the revenues of the State railways show an increase; the position of Germany in the markets of the world does not seem to have suffered materially; but the number of the unemployed is increasing, and relief works have had to be started in some places. The difficulty of finding employment has induced many workmen, whose term of military service has not yet come, to proffer themselves voluntarily to the military authorities without waiting for the official call. They think that by entering now they can tide over the bad times, and may find a more flourishing state of affairs when their term of service is over. Trusts appear to be increasing in Germany, and now include many leading industries, although in textiles they have not been successful. Raw and accessory materials and unfinished products, such as coals, pig iron, copper, rails, chemicals, sugar, and petroleum, seem to have lent themselves best to the formation of trusts. Public opinion in Germany is divided as to their utility. They are supported, even by eminent economists, as beneficent, and are denounced as subversive of all normal commercial development. In some few cases they are approved by the working classes concerned, but, as a rule, they are feared and disliked by the workmen, on account of their great power and extensive ramifications.

SCIENTIFIC AND TECHNICAL DEPARTMENT OF THE IMPERIAL INSTITUTE.

THE SUGAR INDUSTRY OF QUEENSLAND AND NEW SOUTH WALES.

The Director of Sugar Experiment Stations in Queensland, Dr. W. Maxwell, has made an important report on the sugar industry in Queensland and New South Wales, which is published as a supplement to the *Queenslander* of August 31, 1901. Some account of cane cultivation in Queensland was given in the article on "Sugar-Cane Cultivation in Behar" in this JOURNAL (June, 1901, p. 155); in the present report the industry is considered in its bearings on the question of Asiatic and Polynesian immigration, which is now attracting so much attention in Australia, and the following is a *resumé* of its contents.

The climatic data of different districts is given in the following table, from which an understanding of the general variations may be arrived at, but which does not cover the whole climatic situation of each district:—

STATES.	DISTRICTS.	Mean Minimum Temperature in 4 Years.	Mean Maximum Temperature in 4 Years.	Mean of Temperature in 4 Years.	Highest Temperature in 4 years.	Lowest Temperature in 4 years.	Total Units of Heat per Year.
Queensland.	Cairns . . .	67·6	83·3	75·4	100·4	45·1	27,516
	Mackay . . .	63·9	79·8	71·9	96·6	frost	26,280
	Bundaberg . .	61·3	83·4	72·3	99·6	frost	26,389
New South Wales.	Tweed . . .	55·4	78·2	66·2	—	frost	24,163
	Richmond . .						
	Clarence . .						

QUEENSLAND.

The "plantation" system in which the growing of the cane and the manufacturing of the sugar are one concern, and which can only be carried on by capitalists owning large estates, has been superseded by the system of central factories which buy the canes from the farmers and manufacture the sugar. The inauguration of the Government central mill system has made the growth of canes on small farms possible, and has brought about a great change, of which the most highly important economic and social result is that a large number of strong, responsible and progressive white settlers are being established over the sugar-growing areas. At this time there are 2,610 cane-growers in the State of Queensland, with an average area of 42·6 acres per grower under sugar-cane. These small farmers, with their families, are engaged in cultivating their own lands for their own direct gain, with a personal interest in the occupancy of the lands, and have modified the exclusive employment of subject-labour. The number of Pacific Islanders employed has decreased from 10,755 in 1885 to 8,826 in 1899, yet the sugar made has risen from 55,796 tons in 1885 to 123,289 tons in 1899.

It is of paramount importance to realise that the present production of the lands centring round the sugar mills cannot be maintained unless the present sum of labour-power, in some form, is kept up. To reduce the present equivalent of labour-power would be to reduce the current weight of cane produced, and if that falls below a given minimum the mills must stop, as they cannot then meet the bare expenses of running. At the present time the labour furnished by the cane-growers themselves is utterly inadequate to produce the bulk of cane requisite to keep the mills in operation, and hired labour is necessary. The hired labour includes Europeans (chiefly Anglo-Saxons), and Asiatics, Hindoos and Pacific Islanders.

By the Pacific Island Labourers Act the white labourer is protected, and the positions "of engineers, engine-drivers, engine-fitters, blacksmiths, wheelwrights, farriers, sugar-boilers, carpenters, sawyers, splitters, fencers, bullock-drivers, mechanics, grooms or coachmen, waggoners, or household servants," are reserved for his selection; whilst the field work is left for the Pacific Islander, but the white labourer can undertake this, too, if he wishes.

The compensation, that is wages and rations together, received by the white labourer per week for field work varies from £1. 7s. to £1. 17s. The mill hands receive from £1. 7s. 9d. for labourers to £4. 16s. 8d. per week for sugar boilers. The importation and employment of Pacific Islanders are regulated by very stringent and detailed enactments, prescribing among other things their food rations, clothing and medical attendance. The cost of a Pacific Islander in the Bundaberg district is £37. 2s. 3½d. per year, and in the Mackay district it is £32. 0s. 10d. An Islander who re-engages after the end of his first term of three years costs somewhat more, namely, £38. 6s. 4d. per year.

The comparative cost of white and Pacific Island labour in the cane fields is as follows:—

Class of Labour.	Cost per Year. £ s. d.	Cost per Week. £ s. d.	Cost per Working Day. £ s. d.
White labour . . .	80 7 10	1 10 11	0 5 2
Pacific Island labour . .	36 14 10	0 14 1½	0 2 4½

For comparison it may be stated that in Louisiana (U.S.A.) day wages paid to white men in the field averaged about one dollar (4s. 2d.), while the daily wage of the negro was seventy-five cents (3s. 1½d.). In the Hawaiian Islands the unskilled white labourers received about one dollar (4s. 2d.) per day, and the Asiatics seventy cents (2s. 11d.).

Not only must the cost of the different kinds of labour be compared, but also differences in (a) skill or competence to perform work; (b) personal endurance of work; (c) stability in attendance at work; (d) rate of wage for performance of work. The difference of skill is of less importance, as the Pacific Islander is excluded by law from competing in the skilled operations. The endurance of work differs in different districts; the following table gives statistics for limited localities in two districts:—

District.	Working Days in Year.	White Labour.		Pacific Islanders.	
		Days of Work.	Days Lost.	Days of Work.	Days Lost.
Bundaberg . .	313	295	18	295	18
Mackay . .	313	292½	20½	299	14

But a sounder idea can be obtained from notes and statements which cannot be expressed in tabular form. In the Bundaberg district it was found that permanent white hands, say 75 per cent. of the total employed, work approximately fifty weeks yearly. Hands for crushing season do that season only, which ranges from twelve weeks to thirty weeks, or an average of twenty-two weeks. On account of the large amount of sickness during the first year of his term, the Islander is off more days by sickness than the permanent white man. The records of the Mulgrave Central Mill Company show that in 1899 the cutting season commenced with 58 Islanders, 60 Chinese, and 95 Hindoos in the field. During the first months of the cutting season there was little sickness, but as the work extended into the hot weather the original cutting force of 213 men was reduced to 183, whose labour efficiency was much reduced. In place of the sick and disabled men, an extra force of 12 Islanders

and 33 Chinese were put on to keep up the supply of cane, thus requiring 228 men to perform the work towards the end of the cutting season which was done by 213 men during the cooler months at the beginning. The records do not show any white men to have been engaged in the cane cutting.

In considering stability in the performance of work, the white labour has to be divided into two classes, namely, the permanent hands who are employed the year round as team men in the fields and as skilled workmen in the mills; the men of this class are usually picked men of good habits and of good health; it is found that in the main they remain in their positions, and are generally stable in the performance of work where the conditions of nature allow of continuous labour. The second class of white hands is required only during given seasons of the year; in the field during the cutting of the cane where this may be partly done by white men, and in the mills during the crushing season, consequently instability amongst them becomes a part of their conditions, and there is a notable measure of unreliability amongst them. It is found, however, that the instability is greatest in the Northern district, where the personal endurance of work is the lowest; and much of the instability is to be put down to sheer inability to do given kinds of continuous work in those natural conditions.

The conditions of nature in the north render continuous labour by the white man, even in the kinds of work reserved to him by the law, a great physical strain and difficulty, while for the classes of work such as trashing and cutting cane, which are done by the lower types of labour, the white man is practically unfit. This is emphatically supported by the statements of a high medical authority, in the course of an enquiry concerning the action of the climatic conditions in the Northern sugar district of Queensland.

The report next deals with the employment of mechanical and chemical aids in the industry. The ploughing and preparation of the land for planting, and the cultivation and cleaning during growth by means of implements worked by horse power, are reserved for white labour by the provisions of the Acts; these provisions are violated, it is true, but to a decidedly limited extent. There are certain operations equally necessary to the production of the cane crop, which the white labourer has shown a disgust for and frequently declared his inability to perform, namely, hand-weeding, trashing and cutting of the cane, and these are done by the Pacific Islanders. The trashing of the cane, which consists in removing from the stem every dry and fading leaf which has ceased to perform its functions, although imperatively necessary in many districts, and mostly so in those conditions of climate where the white labourer is the least able to perform it, is being neglected, yet at a great cost in the quality of the cane juice.

Great efforts are being made to invent a machine for cutting the cane and thus bring it into the sphere of the skilled labourer. Six different devices have been submitted to the Queensland Government, but it is not possible at this date to indicate how soon a satisfactory device for the purpose will be available.

Lands on which sugar cane is grown suffer great deterioration in their chemical condition; thus the crops of the small cane-growers at the Herbert River decreased from 40 tons per acre to 16, 13, and 12 tons, and the returns of some individual farmers in North Mackay showed a production reduced to merely 4 or 5 tons of cane per acre, whilst in other districts as low as 7 and 8 tons of cane per acre are recorded. The average yield of cane to-day throughout Queensland is about 15 tons per acre, against about 40 tons per acre during the earlier years of the industry. The exhaustion of the soils is shown in the following table:—

	Contained in Virgin Soils, per Acre. lb.	Contained in the Cropped Soils, per Acre. lb.	Loss of Elements per Acre. Per cent.
Lime	3,747	2,538	37·2
Potash	747	432	42·2
Nitrogen	4,650	3,240	31·0

These data set forth the causes of the weakened producing power of the soils; their immediate yielding power has been seriously impaired, but by modern methods of cultivation, rendering available the reserve stores of plant food, and by returning to the lands those elements which are being removed, the producing power can be restored. Time, however, will be absolutely essential, and also the secured freedom of the farmer from any embarrassments which could result from interference with the agencies by which he is carrying on his work.

The volume of the Queensland sugar crop can be gathered from the following table. The lowness of the 1900 crop was due to extreme drought.

Year.	Acres Crushed.	Weight of Sugar. Tons.	Yield per Acre. Tons.
1897	65,432	97,916	1·49
1898	82,391	163,734	1·98
1899	79,435	123,289	1·55
1900	72,651	92,554	1·27

The mean production of the four years was 119,373 tons of sugar, with a yield per acre of 1·59 tons.

The prices of raw sugars of 88 per cent. net titre, f.o.b. at Queensland ports, for the season commencing 1st July, was £8 per ton, with a bonus which is estimated to have added £1. 19s. per ton, thus making a total of £9. 19s. per ton. The price of best white sugar in bond at Brisbane from January to June, 1901, was £16 per ton, this with the duty of £5 makes £21 per ton.

NEW SOUTH WALES.

The areas embraced by the cane-sugar industry of Australia commence in the north upon the 16th degree of latitude and extend south, covering the districts of Mackay, Bundaberg, and the border sub-district of the Logan, and finally descend into New South Wales, where the sugar-cane made for itself a home and a history on the banks and elevations of the Tweed, the Richmond and the Clarence rivers. The records show that in 1864 2 acres of sugar-cane were grown in New South Wales; in 1898 14,578 acres of cane were grown and 29,110 tons of sugar were made. In 1899 the acreage was 9,435; the cane weighed 170,509 tons, a yield of 18 tons per acre, and 15,352 tons of sugar were made. For the same year the production of Queensland was 1,176,466 tons of cane, or 14·8 tons per acre.

The cane interest of New South Wales is of the very highest economic importance to the districts of its location, and should the industry suffer a relapse or go down, such a calamity would carry further interests and the general prosperity of the districts down with it. The mean acreage per grower in New South Wales does not exceed twenty acres, which is less than one-half that of the Queensland growers, which is 42·6. Mixed farming is much more extensively practised in connection with cane-growing than in Queensland; maize being grown upon a considerable scale, and dairying being conspicuously developed, yet cane-growing is looked to as the main industry and the keystone of the continued prosperity of the sugar districts. If the sugar industry disappeared, the home market for dairy products would largely disappear too, since the large number of white hands engaged in sugar work are the chief consumers, and the best customers of the mixed farmers.

In New South Wales the amount of hired labour in the fields is relatively less than in Queensland; this is due to the areas cultivated by individual farmers being less than one-half the size of what they are in Queensland. The hired labour in the fields is chiefly white, but it is supplemented by Pacific Islanders, Hindoos, and some Asiatics. The trashing

of cane, however, is done wholly by the Hindoos or Islanders. The cutting and harvesting of the cane is done chiefly by the mills; if the farmers cut the cane themselves the mill allows 3s. per ton for the work. The cutting is done sometimes by white and sometimes by coloured labour. The conditions are more suitable for the "endurance" and "stability" of white labour than in Queensland. The number of aliens employed in the sugar districts is 933, comprising Islanders and Hindoos. The mean compensation to white labour for work in the cane fields is £1. 8s. per week. Cane cutting is done by contract and on terms whereby the men can earn 7s. per day; they work from daylight till dark. Thus the climatic conditions enable the white man to perform work and earn a rate of compensation which are utterly out of question in the sugar districts of the North.

The wages paid to alien labour are very variable, ranging from a little more than one-half the white man's daily rate, up to an equal rate during the scarcity of labour at the crushing season; the factor of alien labour is not so prominent as in Queensland, as white labour is more easily obtainable from the centres of population in the south and its efficiency is greater.

If the conditions and costs of labour in the sugar districts of New South Wales are considered, then the laws and results observed in Queensland are found in a more accentuated form. The labour co-efficient of the white labourer is more pronounced, while the alien sinks in prominence and concern. From this it appears that the labour powers in the climatic extremes of the sugar areas are made to economically compensate each other; the higher efficiency of the Pacific Islander, at a relatively less cost, who predominates numerically in the Northern districts, counter-balancing the dominating efficiency of the white labourer, who prevails in greater numerical strength in the districts of the South, and whose labour stands at a relatively low cost in those districts when compared with the North.

SUGAR-CANE EXPERIMENTS IN THE WEST INDIES.

A large amount of experimental work is being carried out under the direction of the Imperial Department of Agriculture for the West Indies, with the object of improving the sugar-cane to such an extent that its cultivation will again prove remunerative to the planters. The lines upon which the work is proceeding have already been described in this JOURNAL (Vol. vi., p. 126, and Vol. vii., p. 210), and here it will suffice to say that at present attention is being chiefly devoted (1) to ascertain the varieties of cane most suitable for the particular local conditions, the main points aimed at being a heavy tonnage of cane per acre and a high yield of sugar, and (2) to determine the manurial requirements of the sugar-cane. The report on the experiments conducted in the Leeward Islands (Antigua and St. Kitts) during the season 1900-1901 has just been issued in two parts, which, together, make up 110 foolscap pages, and well illustrate the amount of work which the enquiry entails.

Dealing first with the experiments on the selection of canes (Part I. of the report), it may be noted that although sugar is the staple industry in both islands, yet until recently the only variety of cane grown in Antigua was the Bourbon, while in St. Kitts only two—the Bourbon and the Caledonian Queen—were cultivated. A large number of other varieties, many of which had already been tried elsewhere, were therefore available for experiment, and the most promising of these are now under observation. In Antigua nine experimental stations, the ground of which varies from very heavy clay to light calcareous soil, have been established, and at the principal one 34 varieties of cane were under cultivation, while to each of the other stations the 14 best varieties were distributed. The results obtained may be illustrated by the following table, giving the yield of cane sugar from the six best plant canes:—

No.	Name of Cane.	Cane. Tons per Acre.	Juice. Gallons per Acre.	Juice. Gallons per Ton of Cane.	Cane Sugar. Pounds per Gallon of Juice.	Cane Sugar. Pounds per Acre.
1.	D. 95	28·2	3,931	139·4	2·075	8,158
2.	Mont Blanc	27·1	3,588	132·4	2·022	7,256
3.	Naga B.	26·2	3,574	137·0	1·996	7,134
4.	Burke	27·6	3,646	132·1	1·952	7,117
5.	D. 102	27·3	3,681	134·8	1·897	6,984
6.	Red Ribbon	25·4	3,402	134·9	2·035	6,923

Of the above, the first two, D. 95 and Mont Blanc, occupied the same positions last year; Naga B. was fourth, Burke was ninth, and D. 102 was eleventh. Several of the canes show a loss of position when compared with last year's results, the most noteworthy being the Caledonian Queen, which was formerly third and is now ninth, while D. 116 has fallen from the fifth to the thirteenth place and B. 147 from sixth to twelfth. This, however, may be due to the difficulty experienced in getting these canes to start growing, owing to the drought which occurred after they were planted, and they were consequently somewhat handicapped throughout the season. On the other hand, one or two of the very easily established canes, such as the Burke and B. 109, obtained a much better position this year than last, probably for the same reason. The weights of cane per acre, as well as the amount of sugar in the juice, were in excess of those recorded last year, and D. 95 has again yielded the richest juice and the heaviest tonnage of cane, being second only to B. 147 in the amount of juice expressed by the mill. The trials have shown that the Bourbon cane, which was formerly exclusively grown, is much more liable to attacks by rind fungus than many other varieties, and is consequently not so suitable for cultivation. On only three plots were the canes reaped as ratoons, and it is interesting to note that five of the six canes which give the best results were included in the six best plant canes of the previous year, from which the ratoons were derived, though the order is slightly different. This would seem to show that good plant canes also possess good ratooning powers. In this series D. 95 has been surpassed by White Transparent and Naga B. in the proportion of sugar in the juice, while B. 147 and D. 95 are again noteworthy as yielding a high percentage of juice on crushing.

In St. Kitts, 20 selected cane varieties were grown at seven stations, and, as the soils here are much more sandy than those of Antigua, different results were to be expected. The figures for the six best plant canes may be quoted for comparison with those already given:—

No.	Name of Cane.	Cane. Tons per Acre.	Juice. Gallons per Acre.	Juice. Gallons per Ton of Cane.	Cane Sugar. Pounds per Gallon of Juice.	Cane Sugar. Pounds per Acre.
1.	B. 208	38·8	5,035	129·8	1·947	9,817
2.	Naga B.	39·1	5,067	129·6	1·767	8,956
3.	B. 147	37·8	5,057	133·8	1·755	8,874
4.	B. 376	39·1	5,052	129·2	1·688	8,526
5.	D. 116	38·6	5,153	133·5	1·609	8,290
6.	D. 74	35·3	4,606	130·5	1·735	7,992

The percentages of juice obtained from the canes and of sugar in the juice were both lower than in Antigua, but the tonnage of cane per acre was much greater, and, owing to this, the yield of sugar per acre was also greater. B 208 has so far given better results than any other cane, while Naga B. and B. 147, both well-known varieties, come second and third

respectively. The other three canes in the above list are not so well-known, but from the results quoted they appear to be worthy of further attention. D. 95, which has yielded such good results in Antigua, is here only twelfth, showing that it is not so suitable for the soil in St. Kitts. Very few rotten canes were met with at any of the stations, and the new varieties appear to be less liable to fungoid attacks than those previously cultivated, besides yielding in some cases much better results.

The experiments on the "chemical selection" of canes have also been continued. In this method canes yielding a juice which analysis shows to be richest in sugar are selected for propagating from, in the hope that the plants obtained from them will maintain or increase the yield of sugar. For the purpose of experiment, the ten richest and the ten poorest canes of the white transparent variety were chosen, as it was thought that the results of the selection would be most strikingly shown by a comparison of the two series, one tending toward a richer and the other toward a poorer juice. The experiments of course will have to be carried out for several years before any definite conclusions can be drawn, but it may be recorded that the first year's results show a gain of 1 per cent. in favour of the "high" canes, which, however, is so small as to be within the limits of experimental error.

The manurial experiments are fully described in Part II. of the report, which includes 43 tabular statements of results, and here it will only be possible to summarise the chief features. The manures experimented with were as follows:—(1) nitrogen, as sulphate of ammonium, nitrate of sodium and dried blood; (2) phosphate, both as basic and superphosphate; (3) potash, as sulphate, and (4) guano. In the experiments on plant canes it has been found necessary to distinguish those stations where pen manure was employed from those where it was not, since the results obtained in the two cases differ considerably. Where pen manure had been employed the application of nitrogen produced no material gains, potash gave small gains, phosphate caused losses, and guano no considerable gains. Where no pen manure had been applied, and the fields were in good condition, both nitrogen and guano proved remunerative, phosphates produced losses or no gains, and potash increased the yield; on the other hand, a field in poor mechanical condition was not benefited in the above way, and the state of the soil therefore appears to be of great importance, since where this was defective the application of artificial manures was of no avail. It is concluded that it is possible to grow good crops of plant canes with the use of pen manure only (including also organic manures such as green dressings), and where this can be obtained in sufficient quantity artificial manures are unnecessary. If, however, pen manure is not available, good crops may be obtained with the aid of artificial manures containing nitrogen and potash. The course to be adopted with phosphate is not yet clear, but, if any is used, an application of basic phosphate in the proportion of 1 cwt. per acre is recommended. Under the conditions existing in the Leeward Islands it is suggested that it would be preferable to devote money to the production of pen manure rather than to buying artificial manures, though the latter might find a place in the raising of green dressings for manurial purposes.

THE IDENTIFICATION OF WOOD.

Considering the enormous extent to which the timber trade of the world has grown during recent years it seems strange that, up to the present, no scientific method has been introduced for identifying the many kinds of wood which come upon the market. Some attention has, however, been devoted to the question, and in a lecture before the Society of Arts (*Journ. Soc. Arts*, Vol. L. p. 40), Mr. Herbert Stone, one of the Imperial Institute expert referees on timber, gave an outline of a method which he proposes to use for distinguishing commercial woods by their anatomical characters. The unsatisfactory nature of the present means of identification will be apparent when it is stated that it is quite common for a strange piece of wood to be handed round until someone is found who can recognise it; that cases have occurred where a wood, well known and largely imported, has been pronounced by various timber merchants to be something entirely different; that inferior woods are often substituted for others which they superficially resemble, and that in one case an inferior wood, selling at a low price, was much increased in value by the very simple expedient of changing its name. In addition, very many consignments of excellent timber reach this country, but, owing to lack of information regarding the name, origin and properties of the wood, it is extremely difficult to dispose of, and finally has often to be included in a rummage sale of "unrated" timber in order to recover the freight and dock dues, the result being of course considerable loss to the sender. Afterwards it has frequently occurred that some of these unnamed woods have proved to be very valuable on account of beauty or other property, and have been much sought after, but it is almost impossible to procure further supplies, as, owing to the fate of the first consignment, no more comes upon the market, and, the name and source of the timber being unknown, the sender cannot be communicated with. In a few cases such unknown woods have been identified by means of their anatomical characters, and the source has in this way been discovered, but this method cannot be generally applied at present owing to the limited data at disposal.

The value of the study of the anatomical structure of the wood, as a means of identifying and classifying plants, has been demonstrated by Radlkofer, Solereder and other botanists, but their work has been confined to the examination of small twigs and stems such as usually occur in herbarium specimens. Moreover their attention has been chiefly devoted to the primary wood, and as timber consists of secondary wood, often differing considerably from the former in structure, their results are of little value for commercial purposes. In Germany, however, considerable work on the structure of timber has been done; the European timber-trees have been described in a fairly complete manner by the two Hartigs and Schwartz; Mayr has studied the characters of the conifers of North America, while Nördlinger has described the structure of 1,100 different trees. None of these workers, however, has devised anything approaching a scheme of classification, and the artificial keys which they have drawn up for purposes of identification are either limited in their application or quite unsuitable for practical purposes. The most important English work dealing with the structure of wood is Mr. J. S. Gamble's "Indian Timbers," of which a new edition describing 1,500 different varieties is about to be issued, but, as the descriptions in this are confined exclusively to the native species, they cannot be applied to timbers of other countries.

The points which must be relied upon in a scheme of classification based upon anatomical structure may be briefly noticed before indicating the lines upon which Mr. Stone proposes to proceed. In nearly all transverse sections of wood the annual rings are the most conspicuous feature, but the width of these is rarely of value, since, owing to various causes, it may vary widely even in the same tree. In the oak, for example, the rings will vary from one-sixteenth to five-eighths of an inch in width. The broadest ring will, however, always show the structure of the wood to the best advantage and should, therefore, be selected for examination. The next point to observe, by means of a lens if necessary, is the presence or absence of the true pores—the wood vessels—which, when present, are always most numerous in the spring wood, *i.e.*, the innermost side of the ring. The size of the pores also shows considerable variation, both in the different rings as well as within the limits of each individual ring. In the former case it appears to depend chiefly upon age, and in many woods, such as the oak, the average size increases from year to year until the tree reaches its prime, when it becomes more or less constant. Taking each individual ring, the pores are largest on the inner side, and on passing outwards they always diminish, sometimes only a little, as in the maple, but more frequently to vanishing point, as in the oak. Accurate measurements of the size of the pores are therefore not of much value as a guide, and the

method generally adopted is to take a series of well-known woods as standards of comparison. It should be mentioned that in many tropical woods, whose growth is almost uninterrupted, the ring-boundaries become indistinct or even entirely lost, and the size of the pores appears to increase regularly from the pith outwards. If pores are found in the middle or outer part of the ring while the inner portion is free from them, it is quite certain that they are resin ducts and that the wood is a coniferous one, probably a pine or spruce. The rays, running radially through the wood, are universally present, and, as they vary considerably in different species—in width, height, lustre, straightness, etc.—and can be easily observed, they are of great value for purposes of identification. The extent and distribution of the wood-parenchyma or soft tissue are also important characters, capable of showing wide differences, since this tissue may vary from small patches surrounding the wood-vessels to prominent circles concentric with the rings. In addition to the transverse, the longitudinal sections, both radial and tangential, should also be examined, and will often clear up obscurities in the structure as shown by the former, besides enabling a complete general idea of the wood to be obtained.

The key which Mr. Stone proposes to use for identification depends for its first division upon the character of the rays, which appear to be the most constant feature in timber. Woods having two kinds of rays, as many *Cupulifera*, are separated from those which have but one; the latter are then divided into two classes according as the rays are separated by distances greater or less than the transverse diameter of the largest pores; further subdivisions depend upon the presence of soft tissue and its distribution, followed by the arrangement of the pores and concluding with the definiteness of the ring-boundaries. In this scheme the most easily recognised characters are used for the first divisions, so that the more indefinite ones are left to the end, where there will be fewer species to deal with and other aids can be employed. After the woods have been divided into these ultimate groups the physical and chemical characteristics may be utilized where necessary for further discrimination. In these respects the following points can be usefully observed and recorded:—(1) the range of weight per cubic foot; (2) the hardness (for the practical determination of which Mr. Stone has devised a very simple instrument); (3) the colour of the solution produced by boiling a small quantity of the shavings in water and alcohol; (4) the reaction with iron salts; (5) the capacity for absorption of water; (6) the phenomena observed on burning, such as the exudation of a coloured resin or the production of a characteristic odour or ash (the two Australian paving woods, jarrah and karri, may be distinguished by their yielding on burning a black cinder and a white ash respectively); (7) the character of the surface, whether dull or lustrous, and the particular elements, rays, pores or soft tissue, which produce the effect, and (8) the colour.

For any such scheme to be of value it is essential that authentic specimens of the different woods should be carefully examined, so that their structure may be definitely placed on record for future reference. The botanical name of the plant must also be attached to the description, since the vernacular names often give rise to considerable confusion, the same tree being sometimes known under different names or the same name applied to different trees. Mr. Stone intends in the first place to examine all the Colonial timbers, of which he has already obtained, through the Colonial Office, promise of authentic specimens from most of the colonies. After examination, it is proposed to convert these into several duplicate sets, which will be presented to various public institutions for purposes of reference. Such work will enable home traders to recognise unfamiliar Colonial timbers, which they may meet with, or to obtain supplies of any particular wood, and will also be of great benefit to the colonists as well.

BANANA CULTIVATION IN ASSAM.

The plantain tree, which yields the fruit known indiscriminately by the names plantain and banana, is commonly cultivated throughout Assam, the homestead of the native farmer being generally surrounded by clumps of plantain sufficient to supply the wants of the household, but only rarely affording a surplus for disposal in the local market, although the fruit commands there a ready sale at good prices. In order to encourage cultivation on a larger scale, the Agricultural Department of Assam has recently issued a *Bulletin (Vegetable Product Series, No. 3)*, giving an account of the best varieties of plantain, and of the methods of cultivation which generally give successful results with the tree. It appears that the varieties grown in the province can be divided into ten classes, of which the following short descriptions may be given here.

The Athia Group.—The members of this group are the hardiest of all the plantain species, and are those usually grown round the native homesteads. The trunks possess a dark green colour, without any reddish tinge, and the plant is easily reproduced from seed.

Monohar Group.—These varieties are less popular with the natives than those of the foregoing class. The trees are smaller than the *Athias*, and the sheathes of the fruit are lighter in colour.

Málbhog Group.—This class includes the best varieties of banana grown in Assam. The trees are comparatively short, and the whole external surface exhibits a reddish colour. The fruit has a perfectly smooth skin, and is of a deep yellow colour, the pulp being white.

Purí-Kal.—The fruit of this and the following varieties is usually employed in the unripe condition as a vegetable. The trees grow tall and straight, and so present quite a different appearance from the ordinary plantains, which bend towards the ground.

Hondá.—These trees closely resemble the more valuable *Málbhog* group, but the fruit has a green colour, even when quite ripe, and the pulp has a curious earthy flavour.

The other varieties known in the province are *Jáhaji*, *Cheni Chánpá*, *Barátmoni*, and *Gorinda Tulsi*, all of which have been imported from other countries, but do not appear to compare favourably with the native produce.

In cultivating plantain, a widely different procedure is adopted with the *Athia* varieties from that necessary in the case of the other groups, owing to the immunity which the former enjoy from the attacks of worms, a feature which enables the native to grow them, as already mentioned, close to his farm, on land sodden with nitrogenous refuse.

The finer kinds must be grown at a distance from the homestead, and preferably on land which has not previously borne any crops, and which is therefore comparatively free from worms; for the same reason it is necessary to change the plantation periodically, usually at the end of three years.

In planting, the young saplings are placed in holes of the proper size, and the roots covered over with earth, the positions selected being usually the vacant spaces in betel-nut plantations, since the plantain when mature affords the shade required by the betel-nut palm.

Great care has to be exercised in manuring the finer kinds of plantain to avoid manures which encourage earthworms, and so ashes, paddy husks, and vegetable refuse are generally employed rather than animal matter. The soil in the immediate neighbourhood of the roots rapidly becomes exhausted, and must be replaced by fresh mould. In order that the trees may get the full benefit of the soil, the ground should be kept clear of weeds, and the roots which tend to grow up out of the ground covered again with earth. The trees usually bear fruit two years after planting, but the different classes show some variation in this respect, and also in the value of the fruit they bear, the *Málbhog* class realising the highest price, and the *Athia* varieties the least.

Almost every part of the plantain is utilised by the natives; the fruits in the unripe condition are used as vegetables, and when ripe are eaten raw or cooked with rice and milk. Occasionally the pulp is preserved by being cut into thin slices and dried in the sun, while

a rough kind of flour is made from green fruits by drying in the sun and pounding into meal, which can then be kept in good condition for months.

The flowers are also in considerable demand as a vegetable, and occasionally the bark of the young saplings is eaten in this way.

The whole plant is used as fodder for elephants in times of scarcity.

The refuse portions of the tree, such as the sheathes of the leaves and the skins of the fruits, are burnt, and the ashes used for the preparation of alkali, which is employed in various native dyeing processes and native medicine.

THE CULTIVATION OF EMMER.

Emmer, or, as it is occasionally but erroneously called, "speltz," is a food-grain extensively grown on the arid lands of Central Russia, and also, to a smaller extent, in Servia, Germany, Spain, and Abyssinia. It has recently been introduced into the United States by Russian and German immigrants, and has, in a few years, become so popular that the attention of the Agricultural Department has been directed to it, and, in consequence, a *Bulletin* (No. 139) has been issued for the instruction of farmers who may wish to grow it.

The grain is the fruit of a species of wheat, *Triticum dicoccum*, probably derived from the simpler species, *Triticum monococcum*, from which it differs in having two grains—in place of one—on each spikelet. It first appeared in Switzerland, and from there spread to the countries already mentioned, but it is at present principally produced in Russia, the output there being usually about 16,000,000 bushels per annum. It appears to be grown also in Northern India, Thibet and China. The special advantage of emmer is that it grows well in almost any condition of soil or climate, all the varieties being drought-resistant, whilst rain at harvest time scarcely damages it. The plant thrives best, however, in prairie regions, where there is little rain and the summers are short and dry. Thus, in the Volga region of Russia, where emmer is most extensively grown, the annual rainfall is small, and occurs almost entirely during five months of the year, whilst the extremes of temperature experienced are considerable. Climatic conditions similar to these exist in N. and S. Dakota, where the grain has been tried at the experimental stations, and also by several farmers who have unanimously pronounced it a very satisfactory material to grow. In Manitoba (Canada) the grain has also been grown with excellent results, on account of its drought-resistant qualities and its freedom from the attack of rust, smut, and similar diseases.

Experiments are now being made for the determination of its value as a feeding-stuff for cattle, for which purpose it compares favourably with barley and oats, as the following analyses show:—

	Water.	Ash.	Fat.	Albuminoids.	Amides.	Dry gluten.	Starch.
Specimen I.—							
Kernels and chaff . . .	9.05	3.33	2.10	13.69	—	—	43.03
Kernels alone . . .	10.88	1.53	2.13	16.98	2.10	14.77	48.23
Chaff alone . . .	8.89	7.77	.60	4.88	.38	—	7.50
Specimen II.—							
Kernels and chaff . . .	8.57	2.83	1.50	13.43	.43	—	47.15
Kernels alone . . .	10.06	1.25	2.11	16.24	1.36	13.26	52.14
Chaff alone . . .	6.77	7.16	.71	3.71	.21	—	8.81

The grain has not been used to any extent in the United States as human food, but is so employed in Russia, where it is ground into a meal called "krupa," and used for making a kind of porridge (kasha).

In spite of its somewhat limited cultivation, a considerable number of varieties of emmer are already in existence, distinguishable by the colour of the chaff into red, white and blue-black groups. The varieties experimented with in America belong to the white chaff group, and ripen late in the spring.

Among other valuable features of emmer are the readiness with which it crosses with wheat, conferring on the latter its own drought-resistant qualities and non-liability to fungoid growth.

THE EFFECT OF SODIUM BISULPHITE ON LEATHER.

One result of the disappearance of forests in civilised countries has been to render the tanners of these countries dependent on external sources for tanning materials, and, so, large quantities of tannin-bearing barks, leaves, and fruits are annually imported into Europe from India, South America, and elsewhere. Recently it has become customary, in order to avoid the expense of carriage, to prepare extracts of these materials, and this industry has now assumed large proportions in India, the United States, Germany, Italy, Sweden, and other countries, including Great Britain. In the preparation of such extracts it is almost impossible to avoid the production of certain dark brown colouring matters by the long-continued heating of the aqueous liquors obtained during the extraction process, and as this colouring matter is absorbed by hide along with the tannic acid (producing a dark coloured leather), it is desirable that it should be removed. This object can be accomplished in various ways, such as the addition to the concentrated liquor of a certain quantity of raw blood, the mixture being subsequently heated until the albumen coagulates and floats to the top carrying with it the objectionable colour, or solutions of metallic salts may be added which, by forming insoluble "lakes" with the colouring matter, precipitate it in a form in which it is easily removed. These methods are, however, objectionable, since they involve the loss of a certain proportion of tannic acid, and in 1897 an improvement was introduced and patented by a German firm which depended for its efficacy on the bleaching of the colour by sulphur dioxide added in the form of sodium bisulphite.

Extracts decolourized in this way always possess a strong odour of sulphur dioxide, and this peculiarity has prejudiced English tanners against them, since it was assumed that this impurity would lead to the occurrence of sulphuric acid in the finished leather, which would, therefore, be brittle and of poor quality.

This subject has been investigated by Dr. J. Gordon Parker and Mr. A. Gausser, of the London Leather Industries Laboratory, and the results obtained were communicated to the Society of Chemical Industry and are printed in the current number of the *Society's Journal*.

The extracts made from mimosa and quebracho barks were first examined and found to contain sodium bisulphite and some free sulphurous acid; leather tanned with these extracts was then examined for its content of free acid, and in this respect was found to be normal and to contain no trace of either free sulphurous or sulphuric acids.

Specimens of brittle leathers supposed to have been produced by the use of extracts containing bisulphite of soda, which had been submitted by various tanners, were then examined, and the inferiority was found to be due not to sulphuric acid but to overtanning of the leather by the use of too concentrated liquors in the tanning vats.

It was also observed that the hide always absorbed a certain small proportion of sodium bisulphite, which was almost the same in amount whether the tanning liquors contained much or little of this salt, but the amount so absorbed, usually about .5 per cent., has no effect whatever on the quality of the leather eventually obtained. These results are of considerable importance, since by the use of such decolourizing agents it may be possible to utilize for the manufacture of tanning extracts, tanning materials containing what are at present objectionable colouring matters which preclude their employment in tanning.

LECTURES AND PAPERS.

"FACTS AND FANCIES ABOUT CANADA."

(By J. W. BENGOUGH, Esq.)

Sir CHARLES RIVERS WILSON presided, on the 11th November, at a lecture delivered at the Institute by Mr. J. W. BENGOUGH, entitled "Facts and Fancies about Canada." Mr. Bengough, who was formerly editor and cartoonist of *Grip*, the Canadian *Punch*, illustrated his lecture with impromptu crayon sketches; and Sir Rivers Wilson, in his introductory remarks, said that in the whole of His Majesty's dominions a colony having a larger claim upon the public interest of this country would be hard to seek. Englishmen generally, however, had much yet to learn about Canada, and Mr. Bengough was well equipped for the task of filling up such gaps as existed in their knowledge of this great country, which he—Sir Rivers Wilson—from the personal acquaintance he had with it, was certain had a prosperous future in store for it.

Mr. Bengough, after referring to the gratification it afforded him to address an audience at the Imperial Institute, said that the subject of Canada was, of course, too large a one for him to attempt anything like an exhaustive treatment of in the short space of one evening. He should only, therefore, endeavour, with the aid of his cartoons, to expose some few of the *fancies* which he found existed in the minds of the British public, whose ideas on many Canadian subjects were, even if correct, often very vague. What John Bull saw when looking across the Atlantic was often shrouded in fog.

The people of this country were, of course, well aware that Canada formed part of North America, but they had a tendency to confuse America with Canada, and to think of American as meaning Uncle Sam only. A boundary line, however, existed between the United States and Canada, "Uncle Sam was by no means the only pebble on the beach," which, roughly speaking, divided the Continent into two parts, the northern—Canada—being rather the larger of the two. The two nations had, of course, a common origin and language, but they differed in some important respects apart from their forms of Government.

The early history of the country, beginning with its discovery by Columbus, was fairly well known in England, although perhaps many people were unfamiliar with the war of 1812, which lasted three years, when the United States attempted to absorb Canada. Since that time the wars waged in the Dominion had been against the forces of nature. During the last hundred years Canada had grown from a wilderness to a beautiful and prosperous Commonwealth—a land of homes, schools, churches, factories, and shops, as well as of farms, mines, and ranches.

A glimpse of the true Canada of to-day had recently been given by a correspondent of one of the London newspapers, who had accompanied the Prince of Wales on his recent journey through the Dominion, and who, after eulogising its travelling facilities, had said that it was difficult to understand why more English tourists visited the United States than this beautiful and romantic country, where they would be under their own flag, and much more at home, and more in sympathy with the people, than they could be in a foreign land. At the autumn season of the year the climate of the Dominion was delicious, neither hot nor cold, and to breathe the keen pure air of the woodlands, prairies, and mountains was indeed exhilarating.

The climate misconception seemed very deep rooted in this country, where everybody was familiar with Kipling's *Our Lady of the Snows* and the *Miss Canada* of *Punch*. In many parts of Canada there was certainly plenty of snow, and there were many cold spells, in winter, but over large regions of the Dominion the winter did not last for the greater part of the year, and the wintry weather was not gloomy nor unpleasant, but on the contrary brisk, bright, and bracing. Mr. Bengough here recited a spirited poem, a reply to Kipling's *Our Lady of the Snows*, and, with reference to the *Miss Canada* of *Punch*, drew what he considered a much more applicable typical representation of Canada—a male figure, *Jack Canark*, suggestive of strength, youth, and enterprise, as exhibited in the Canadian lumberman, river-driver, and rancher.

Besides the misleading abundance of furs in the English representative pictures of Canada, Mr. Bengough referred to the Indian adornments so often also depicted. It would be easier, he said, to find Indians about the India House in London than round Toronto. Hundreds of Canadian children had never seen an Indian. The Indians "still in the business" were only to be found in the Far West, where they had no use for tomahawks or war paths.

Farming and stock-raising were the chief industries of Canada, although it was also a lumbering, mining, and manufacturing country. What it wanted was men and money. Why, said Mr. Bengough, (again quoting from a London newspaper), was it that Canada, a country of splendid natural resources capable of sustaining an enormous population, did not develop in the same ratio as the United States? Why was it that British Capital did not seek investment in civilised law-abiding Canada instead of going to some savage South American Republics, while the splendid farm lands of Canada, which could grow every pound of bread that Great Britain required, were, comparatively speaking, a vast solitude? Why, he continued, should not a few millions of British money be devoted to the development of cattle and wheat in Canada? Emigration from this country to the Dominion could not be the success it ought to be until capital went as well as labour.

The same practical conclusion, as to the importance to Great Britain of the Dominion as a food-producing region, had quite recently been arrived at by Mr. Rider Haggard in his articles on the results of his investigations on the condition of English agriculture, which pointed to the prospect of Britain being, before long, at the mercy of foreign nations for her food supply. Why not, in view of such a possible day, develop the food-producing Colonies and especially the nearest of them, Canada?

Great Britain found in the Prince of Wales a hearty co-operator in the carrying out of this policy of the building-up of Canada, and Mr. Bengough here quoted the following remarks His Royal Highness had recently made at London, Ontario: "We have seen enough to carry away with us lasting impressions of the vast resources of the Dominion . . . which will ever call for the steady reinforcement of suitable emigrants from the mother-land."

The Dominion was a great country for politics—a fact which would surprise many of those Englishmen who still thought of Canada as it was pictured in those venerable steel engravings by which British travellers, about the year 1806, illustrated the books they wrote of their travels in Upper Canada—that is of a forest country, with little clearings full of stumps, surrounding log houses, with wolves in the foreground, and a few wild Indians near at hand.

The Canadians took a great deal of interest in municipal and provincial politics, but it was of the wider politics that Mr. Bengough said he was more especially referring to, and the creed now held, universally, concerning them in the Dominion could be summed up into one brief phrase—the Unity of Canada and the unification of the Empire. To this policy there was no opposition, and it was advocated with equal fervour by both political parties. It was the general belief and desire of the Canadian people to maintain their position as part of the British Empire, and any sentiment for annexation that had existed was now dead, the prevailing feeling on this point being now all in the direction of Imperial Unity.

Mr. Bengough had a good deal to say about the views of those who still advocated annexation, and who had long since made up their minds that it was the manifest destiny of the Dominion to become a part of the United States. In this connection he referred to the fancy that he had found not a few persons on this side of the water to entertain, viz., that the Canadians looked forward with complacency, if not with pleasure, to this ultimate destiny of their becoming part of the United States. He did not know of any Canadian who so

regarded this question, but was certain that it would be impossible to find an annexationist in Canada amongst the leading men of any party or sect; indeed, so unpopular and repugnant was the idea, with the general public, that it would be impossible to elect a candidate, even for the humblest office, who was known to favour it. Annexation, continued Mr. Bengough, would never have the consent of Canadians unless practically every man in the country underwent a radical change, and the people became dissatisfied with the Canadian institutions and form of government, which, he said, they, at present, much preferred to those of the United States.

The Canadians had the utmost goodwill towards their neighbours. Inter-marriages were frequent. A million Canadians resided in the States, and many Americans in Canada, and naturally a good deal of commercial intercourse existed between the two peoples. There was also a decided tendency for the Canadians to import smart slang phrases from America, and in their general manners and customs they conformed much more to American ways than to English, yet these conformities and resemblances were, he maintained, only skin deep, and that essentially the Canadians were British, more British, if possible, certainly more exuberantly so, than the inhabitants of Great Britain itself. He was of opinion that the North American Continent would continue to be occupied by two friendly Powers, and drew a detailed and attractive picture of the mission the Canadians had in helping on the restoration to perfect friendship between the States and Great Britain.

He had also much that was eulogistic to say about Saxon unity. Canadian Unity and Australian Federation had both been attained, and Imperial Unity was now aimed at. Reference was also made to the many advantages to be derived from a re-arrangement of the fiscal relations between the different sections of Greater Britain in the direction of what was known as free-trade within the Empire; and a hope was expressed that Great Britain would assist in the building-up of Canada by sending men and money to that country, and by showing an increased preference for Canadian products. Mr. Bengough also dwelt upon the recent popularity of Canada in Great Britain.

To more forcibly bring home many of the points of his lecture he recited some of his own poems, notably one entitled *Able to feed the Motherland*. His cartoons, many of which he drew during the evening, were greatly appreciated by the large audience present.

Sir Rivers Wilson, in proposing the customary vote of thanks, said that he hoped the information which had been so well and agreeably given would go beyond the present audience, and would tend to diminish many of the misconceptions which still existed in this country with regard to Canada. He considered it a matter of regret and surprise that Englishmen did not flock out to that most beautiful, attractive, and productive country which Mr. Bengough had just described.

"THE BROWN COAL-BEDS OF VICTORIA, THEIR CHARACTERS, EXTENT, AND COMMERCIAL VALUE."

(By JAMES STIRLING, Esq.)

Professor E. HULL, late Director of the Geological Survey of Ireland, presided on the 18th November at a lecture delivered at the Institute by Mr. James Stirling, Government Geologist and Mining Representative of Victoria, on the "Brown Coal-beds of Victoria, their Character, Extent and Commercial Value." In a lecture which Mr. Stirling gave at the Institute about a year ago (see JOURNAL of January, 1901) on the "Coal Resources of Victoria," he gave some account of these brown-coal deposits. Since then, however, he has visited Germany, and other parts of the Continent of Europe, to study the latest methods there adopted of utilizing this class of fuel, and the most interesting portions of his lecture were those in which he described the information he had obtained on his journey. Professor Hull, in his introductory remarks, said he happened to be unacquainted with these brown-coal deposits of Victoria, and, therefore, looked forward with a considerable amount of interest to what the lecturer would have to say on the subject.

The question of utilizing the large deposits of tertiary fuel known to exist in the Latrobe Valley, Gippsland, at Newport near Melbourne, Lal Lal near Ballarat, Dean's Marsh near Geelong, and at other places in Victoria, to commercial advantage in the interests of the State was, said Mr. Stirling, of considerable importance at the present time, when each portion of the Australian Commonwealth was, so to speak, taking stock of its natural resources. He estimated that the State contained about 600 square miles of proved tertiary coal-beds, more than half of which occurred in the Latrobe Valley, which, as the main line of railway from Melbourne to Gippsland passed right through the district, was in direct railway communication with all the large industrial centres.

Detailed topographical and geological descriptions of the Latrobe valley were given. As a result of boring shafts, etc., at various localities, extending from Darnum on the west to Toongabbie on the east—a distance of nearly fifty miles—seams of brown-coal from 30 to 265 feet in thickness had been proved. At one place near Morwell a diamond-drill bore had been carried to a depth of 1,000 feet passing through several beds of the coal, three of which were 265 feet 6 inches, 227 feet 10 inches, and 166 feet 1 inch thick, respectively. Making due allowance for the fact, based upon geological considerations, that the deposits occurred as lenticular masses, thinning towards the end of the basins, old marshes, lakelets, etc. in which they were accumulated, and estimating that they covered an area of fully 340 square miles, there could not be less than 31,144,380,960 tons of brown-coal in the district, available at depths from surface to 1,000 feet levels. The cost of production of this material into briquettes, which should command a ready sale in Melbourne from 18s. to 20s. a ton, was from 7s. to 8s. a ton. A diagram of the Morwell bore was thrown on the screen, and Mr. Stirling dwelt at length upon the geological formation of the beds. There was, he said, evidence of extensive faulting of the strata since the older tertiary deposits and volcanic flows had been deposited, thus lowering the central part of the Latrobe Valley over the area now covered by the pliocene and later beds.

Approximate analyses of the samples at Mirboo Collieries, and of this Morwell bore, had shown clearly a general increase of the percentage of fixed carbon—heat-giving qualities—with the depth; in the former from 27 per cent. to 41 per cent. and in the latter from 26 per cent. to 48 per cent. Details of the results of several other bores, put down in the Latrobe and other districts, were given. The beds at Newport near Melbourne were 70 feet thick, and it had been suggested that they might possibly be utilized for the production of electrical energy in order to supply heat, light, and motive power to the metropolis. Deposits at Lal Lal, near the great mining centre of Ballarat, could, it had been suggested, be used for producing gas for smelting purposes, in a similar way to that now being carried out in Styria, and the deposits at Dean's Marsh near Geelong might also be turned to account for manufacturing purposes.

Referring to his recent visit to Germany and Austria, Mr. Stirling said that he was of opinion that the present development of numerous industries over large areas in those countries had been principally due to the methods employed for the economic production and utilization of this class of fuel. Its output was greatly increasing in both countries, even in direct competition with the older and more highly bituminous black coal. In N.W. Bohemia, tertiary-coal was used exclusively for locomotive purposes.

The main seat of the Rhenish brown-coal was on the uplands of the hills near Cologne, known as the Ville, in which there were about 18 brown-coal quarries and briquette factories, capable of producing nearly one and a-half million tons per annum. He had only had time to visit one of these works, in which 650 men were employed, winning about 4,000 tons per 24 hours. The cost of manufacture of a ton of briquettes from this material (including 7½d. for mining) was between 5s. and 6s. A description was given of the method of manufacture, and the machinery used. The briquettes for household purposes were 7 inches by 2½ inches

by 1½ inches, and smaller ones were made for industrial purposes. The output at these works during the time of his visit was 700 tons per day, which sold at Cologne at 15s. a ton. Special locomotives for burning brown-coal briquettes were constructed in Germany.

At some works near Halle, where the brown-coal was more friable and somewhat earthy in parts, two classes of briquettes were made: wet-pressed ones from the inferior and more earthy coal, which were dried in suitable sheds, and the more valuable dry-pressed ones, for manufactures and domestic fuel.

For the proper utilization of brown-coal, it was most essential that it should be carefully examined before being dealt with. Some kinds were suitable for the manufacture of briquettes, and others for the distillation of oil. Special attention was being paid to this fact at these works near Halle, where the distillation works, retorts, etc., were situated close to the briquette factory, so that the coal suited for mineral oil fabrication—which was selected after analyses of samples—was conveyed directly to the distillation retorts, where it was converted into tar, then into various oils, and finally into paraffin. The residue formed a commercially valuable coke, which was now being burned in suitable ovens all over Germany, for heating purposes. To emphasize the importance of subjecting brown-coal to scientific examination before treatment, Mr. Stirling quoted the results of some experiments with samples of Morwell coal, some of which had yielded as much as 30 gallons per ton, and others as little as 7 gallons. The coal containing the smaller amount of oil was, of course, the better suited for manufacture into briquettes.

In Austria the brown-coal industry was carried on on a large scale. In 1899 246 enterprises had been at work, employing 50,790 men, and producing 21,750,000 tons of coal, valued at nearly £4,000,000. Nearly half of this coal was exported, chiefly to Hungary, Prussia, Brandenburg, Wittenburg, Saxony, and Switzerland. The brown-coal industry of Hungary was also largely on the increase.

Recent experiments made in Germany with the Morwell coal had shown it to be superior to the average of that found on the Continent of Europe, while some samples, tested for tarry matter and oil, had proved superior to the average Scotch shales. It was said to be capable of manufacture into the following products:—

Briquettes, wet and dry pressed,
Various oils and paraffin,
Coke and pitch,
Colouring matters,
Gas,
Antiseptic soap,
Sheep-dip ointment,
Disinfectants, etc.

If the German methods of the utilization of this coal were adopted in Victoria the establishment of various industries all round the centres where the coal-beds occurred would, Mr. Stirling contended, be only a question of time, and the adoption of an energetic policy of promoting such production by the Government must, he considered, result in great commercial enterprise and industrial extension.

Professor Hull, in proposing a vote of thanks for a very interesting lecture, said that coal—mostly bituminous black coal—was now being extensively found in several of our colonies, and that Victoria was fortunate in possessing such large deposits of fine mineral fuel which, although only brown-coal, would seem to be of considerable importance to the State. He thought that Mr. Stirling was quite right in advising his Government to study, and adopt, the German methods of utilizing this class of fuel. Professor Hull also made eulogistic reference to Dr. Selwyn, who had been his first teacher in Geology, and also, as the first Government Geologist of Victoria, one of Mr. Stirling's predecessors.

"WESTERN AUSTRALIA.

"ITS PAST, PRESENT, AND PROSPECTS FOR THE FUTURE."

(By the Hon. H. B. LEFROY.)

The Hon. H. B. LEFROY, Agent-General for Western Australia, on Monday, 25th November last, delivered a lecture at the Institute on Western Australia. Sir GERARD SMITH, formerly Governor-General of the State, presided, and, in his introductory remarks, referred to the services Mr. Lefroy had rendered to the country as Minister for Mines during his term of office in the colony.

Western Australia, with a population of 200,000, was, said Mr. Lefroy, greater in extent than France, Spain, Portugal, the German Empire, and Austria-Hungary, with their 160,000,000 of people; and countries with which perhaps many of his hearers were more familiar than with this distant portion of their own Empire.

A short and interesting account of the early history of the country was given, which had practically began in 1829, when the British flag had been hoisted by Capt. Fremantle at the port now bearing his name. The progress of the country had, at first—until the discovery of gold—been but slow. A description of the Capital, Perth, of the harbour-works at the mouth of the Swan River, and of some of the institutions, specially those relating to its methods of government, was given.

The great industry of Western Australia at the present time was gold-mining, though side by side with it was prospering the cultivation of the soil, upon which, more than gold, depended the ultimate and permanent prosperity of the country.

Anyone who knew the goldfields of Western Australia by actual travel over the country, by observations made on the spot, and by wandering through drives and cross-cuts, and struggling up slopes, and not by operations on the Stock Exchange, must be struck by the marvellous developments which had taken place during the last eight years, the enormous area over which the auriferous deposits extended, and the wonderful possibilities the future held in store. The gold-bearing district reached from Kimberley, in the north, to Phillips River, in the south, a distance of over 1,000 miles in length with a width of more than 300. In spite of all that had been said to the contrary, he contended that the progress of gold-mining in Western Australia was without parallel in the history of gold-mining elsewhere. Compared with the progress of the Rand, during the first six years of its active development, Western Australia had shown a far better record; the total being three million ounces for the Rand, and four million for Western Australia. Again, Western Australia had been gradually and surely increasing her output, until, during the first ten months of the present year, (1901) she had produced 1,530,741 ounces, or nearly as much as the output for the whole of any previous year.

The first payable gold-bearing region in the country had been discovered in 1884 at Kimberley. Pioneers had then soon scattered afield and opened up new districts over hundreds of miles of territory, notably at Pilbarra, Nullagine, and Marble Bar, and in 1887 similar discoveries had been made in the neighbourhood of Southern Cross. Still, in 1892, shortly after the establishment of responsible Government, the value of the gold output had totalled only to £226,283. That, however, was the year of the rich discoveries at Coolgardie, where the outcrop of the reef had been found thickly studded with gold, and chunks of solid bullion were exposed "to the naked eye of those sturdy wanderers whose privations and exertions were so well rewarded."

This had created a rush to the shores of Western Australia from all parts of the world, and the beginning of her national prosperity, population, and wealth, really dated from that period. This influx also had been directly responsible for the opening up of what was known as the great auriferous belt of Western Australia. The difficulties with which the gold-miners of these early days had to contend would be readily understood, when one remembered that this district was situated some 400 miles from the sea-board, in a most inhospitable region, with but little animal life or water except such as was saltier than the sea.

Large areas of the country were soon pegged out under the Mining Laws, which permitted such, in blocks of not more than 24 acres, at an annual rental to the Government of £1 per acre.

On this wave had come the ubiquitous company promoter, and the mining expert from London. Good properties were discovered, although many of them had been retarded in their produce by over-capitalization, while some mines, placed in London and elsewhere, had never had an ounce of gold in them. People had thus lost their money and anathematized the country, although it really possessed great wealth and was capable, under fair and economic treatment, of yielding profitable returns to those who invested their money there in the gold-mining industry.

In the year following the discovery of the Coolgardie goldfields those of Kalgoorlie, 23 miles further east, commenced their existence. The Kalgoorlie group of mines—the Golden Mile—had proved itself to be the richest known spot on earth. At the present time Kalgoorlie was as up-to-date a town as any of its size in the world, and possessed fine buildings, well-laid-out streets, excellent hotels, and all the comforts of civilization; besides being connected, by an excellent train service, with the capital, Perth.

The value of the gold already extracted from the mines in this neighbourhood was over £12,000,000, the value of the machinery employed was estimated at over £1,000,000, and during last year dividends to the amount of £1,167,441 had been paid. These mines, which employed nearly 8,000 men and were responsible for a population of from 30,000 to 40,000, at depth continued to prove their richness, although the ores beneath the oxidised zone were more difficult of treatment. The processes of dealing with the sulphide ores were being gradually perfected, and splendid ore reduction plants had been erected. The Government Geologist, who had recently made a geological survey of the main Kalgoorlie belt, had stated that, geologically, there was nothing to prevent the lodes within the "Golden Mile" going down to any depth that man had ever mined.

Reference was made to several other districts where discoveries had been made, and auriferous country in various parts of Western Australia was now being prospected and in many cases payable mines opened up. Most of the holdings embraced in the large area of nearly 40,000 acres under lease throughout the colony for gold-mining were at present in the hands of small men, who, for the most part, were making a living and awaiting that capital which was so necessary for successful mining.

The country had produced, up to the present time, gold to the value of £28,000,000, and as yet the industry was only in its infancy.

Besides gold the country was rich in tin, copper and coal. These minerals were found in several localities; tin chiefly at Greenbushes in the south, and Marble Bar in the north; copper in the Mount Margaret and West Pilbarra goldfields; and coal at Collie, where the output for last year had been 118,000 tons, as against 54,000 tons for the previous year. The coal was being largely used on the railways and had proved also a valuable domestic fuel.

The progress of mining had been the progress of Western Australia. The population was now nearly six times what it had been in 1885; the revenue then had been £323,000, while for the current year it was estimated at £3,400,000. During the same period the value of the exports had increased from £446,692 to £6,852,059, and the imports from £650,391 to £5,962,178.

Although, however, Western Australia had achieved her present position mainly through the fascinating influence of gold, it must not be thought, said Mr. Lefroy, that her future was to depend upon it alone, as she possessed other and varied resources. Her forests, for instance, constituted a material asset of great magnitude, and covered an area of over twenty-four million acres, with a marketable timber said, a few years ago by a late Conservator of Forests, to be worth no less a sum than £124,000,000 after deducting one-third for waste in sawing.

The jarrah was the principal tree of the country, predominating in the extent of its forests and the various uses of its timber, the chief characteristic of which was adaptability for constructions necessitating contact with soil and water. The wood was practically indestructible and not attacked by the borings of the cheluria, teredo, or termite. Its resistance to white ants was remarkable, and houses built of it had been known to exist in perfect preservation for nearly 100 years. With age it became extremely hard and almost unworkable. When freshly cut its weight was a little over 70 lb. per cubic foot, but this lessened to 60 lb. when thoroughly seasoned. It was red in colour, comparatively easily worked when fresh, and polished splendidly. Some of the purposes for which it had been used were wood-blocking, piles, jetties, bridges, boat-building, posts, furniture and railway sleepers. Its remarkable suitability for piles, or any works requiring immersion in salt or fresh water, was well known in Western Australia. In the office of the Woods and Forests Department there were specimens obtained from piles and girders, which had been in use in local harbours and bridges for 60 years and were still perfectly sound and free from any sign of decay; if anything, indeed, the timber seemed more durable and solid than freshly cut wood. There were also instances of railway sleepers which, although laid down 18 years ago, seemed as sound as ever, and the records of fence-posts having lasted long periods in the ground were numerous.

The karri, the giant tree of Western Australia, and without doubt the finest and most graceful tree in the Australian continent, was the next most important commercial tree in the country. It was almost always straight in growth, and towered skywards for great heights without having even the semblance of a branch. The tree grew very rapidly, and its average height might be put down at 200 feet, with a diameter of 14 feet. This tree was the source of great wealth to the country and, owing to its lateral strength, which was greater than that of the jarrah, it was specially adapted for works which were required to bear considerable weight and strain. For street-paving it was said to be equal to, if not better than, jarrah. Both of these timbers were largely imported into London, and were also finding a market in South Africa, India, and elsewhere. Mr. Lefroy was of opinion that, where timber was required for street-paving, no other available for such purpose would be found, when properly laid, to surpass these indigenous woods of Western Australia for durability and usefulness. The exportation of timber generally was on the increase, and he considered that the forests would play a very important part in the future welfare of the country.

Pearl-fishing was another industry which, on the north-west coast, was being actively prosecuted, and had a distinctly bright future before it.

Besides these natural resources, Western Australia possessed large tracts of country suitable for the cultivation of all the food necessary to make the country self-sustaining. In the south-west were to be found large areas of rich fertile land which could be acquired on the very easiest of terms. Free farms of 160 acres were given away by the Government to persons owning not more than 100 acres, on condition that certain improvements were effected within given periods. The settler could turn his attention to either the growth of cereals, the cultivation of fruits and vegetables, or the raising of stock, for all of which the land was eminently suited.

Agricultural settlement had increased largely during the last decade. The area under crop, which had more than doubled, was said to be over 200,000 acres. For *bona fide* agriculturists there was ample room in Western Australia, where the question "who will buy my produce after I have grown it" could be more satisfactorily answered than in any other country. On the rich goldfields, where the limited rainfall would not permit the growth of agricultural produce except by the use of water artificially applied, there was engaged an ever-increasing population entirely dependent on outside sources for all their food supplies; and thus, linked by rail to the producing centres, was a large consuming population.

The production from the soil in Western Australia had not as yet been able to meet the demand, so that during last year the country had had to import from the Eastern States produce amounting to nearly £700,000 in value—less however by £200,000 than that of three years previous. The supply was now gradually catching up to the demand, although the latter was yearly increasing.

Western Australia, too, was noted for its fruit. Grapes, stone-fruits of every kind, oranges, lemons, apples, pears and many other fruits, with proper attention, grew as well there as in their native countries. The future of the wine industry especially was one of great opportunities, the soil and climate being particularly favourable for its successful prosecution. Practically the whole of the south-west division of the colony was adapted for viticulture, and already 100,000 gallons of wine had been manufactured locally in a year.

The position of the country as the nearest portion of Australia to the old world must, Mr. Lefroy contended, ultimately be an advantage to the intending vigneron, orchardist, or farmer.

The Government was doing everything in its power to assist settlement and open up the country. One thousand four hundred miles of railway had already been constructed in different directions. Telegraph lines had followed the prospectors even to the remotest mining camps. The face of the whole country was dotted with schools, wells, and dams; and tanks have been provided everywhere to supply the goldfields and other places with water.

A large reservoir had been constructed in the Darling Range, 23 miles from Perth, containing sufficient water to pump five million gallons daily to the Kalgoorlie and Coolgardie districts, a distance of nearly 350 miles. When the necessary connections were completed it was estimated that water could be supplied to these goldfields at 3s. 6d. per thousand gallons, or about 5 per cent. of the present cost of condensing water in those localities. All this had not been done without the expenditure of borrowed money, but such money had, Mr. Lefroy contended, been well laid out. A country with such unbounded resources warranted the outlay; and her railways, her large tracts of unoccupied country waiting settlement, and her increasing revenue, were noble assets to set against her small indebtedness of £14,000,000.

Mr. Lefroy, in his concluding remarks, said that he hoped his lecture might be the means of encouraging some of those present to take an interest in Western Australia, his country by birth, and one of which he felt he had every reason to be proud.

He showed some excellent slides illustrative of the mineral and agricultural resources of the country; and Mr. E. T. Scammel, the official lecturer on the resources of the colony, described, with the aid of photographic views, some beautiful stalagmite- and stalactite-caves recently discovered by Mr. C. Congrave near Cape Leuwin.

"THE COMMERCIAL ROUTES OF SIBERIA."

By CAPTAIN WIGGINS, F.R.H.S., ETC.

(ANGLO-RUSSIAN LITERARY SOCIETY).

At a meeting of the Anglo-Russian Literary Society on November 5, the president, Mr. E. A. Cazalet, in the chair, the well-known navigator and explorer Captain Wiggins, F.R.H.S., M.R.Y.G.S., etc., read an interesting paper entitled "The Commercial Routes of Siberia by Land, River and Sea," followed by the exhibition of a series of curious photographs.

In his introductory remarks, Mr. Cazalet mentioned Captain Wiggins' paper "The Kara Sea Route," read before the Anglo-Russian Literary Society in July, 1896, spoke of the useful work which the lecturer had done in opening out this famous route, which put Great Britain in direct communication with the River Yenesei and the heart of Siberia. The late Emperor of Russia had fully appreciated Captain Wiggins' exertions in this direction, and had presented him with a beautiful silver service in token of his approval.

The lecturer began with a description of the longest and most ancient of all known routes, the famous Siberian overland route, which had existed for centuries, even before the advent of the mighty Genghis Khan. It was intersected at the many different trading stations by numerous bye-roads leading to the far-off territories of Mongolia, Turkestan, and Persia in the south, and the desolate, but valuable fish- and fur-trading and gold-mining districts of the far North. Along these ancient roadways might still be seen thousands of caravans of merchandise-laden sledges or carts. Some of them were a beautiful sight, drawn by the finest horses of the land, with their bright sledges and harness; others on the southern roads, near the Mongolian or Kirgese Tartar countries, were more curious, being drawn by huge camels enveloped from head to stern in immense sacks or cloaks made of thick hair felt. Passing on to an account of the renowned trans-Siberian railway, the most triumphant engineering feat of our age, covering 8,000 miles, Captain Wiggins said that he had himself inspected the line and found all the most important work, such as the large bridges over the rivers, and the splendid cuttings through the gorges, and round the precipitous bends of the Oural Pass, of the most durable and efficient kind. Added to this the attendance and accommodation all along the line were more than adequate.

Finally, the lecturer dwelt at some length on the riverine routes of Siberia, showing how the great Obi, Yenesei and Lena were intersected by numerous tributaries, all running nearly at right angles to the main river system, which completed a lace-like web of valuable commercial riverine-transit, capable of being navigated by steamers in summer and valuable as sledge roads in winter. A mammoth ice-breaker steamer kept Lake Baikal open during the winter, and as this lake was intersected by the Selenga river and the headwaters of the Amoor, which in its turn was in touch with the trans-Baikal portion of the railway, steamers and barges were able to supply goods or receive produce from the shores of the Pacific Ocean. Added to all these natural waterways, canals are being constructed in order to connect the larger rivers.

In conclusion, the lecturer expressed the hope that before long the Russian Minister of Finance, M. Witte, would again tempt British merchants and mariners to make their voyages by the Kara Sea, by removing the embargo that he had lately placed upon goods entering Siberia by that route. The inhabitants would then once more enjoy the stimulating influence of cheap wares, etc., and would secure an easy transit for their own products to the European markets, instead of being subject to the expensive carriage earned by a powerful monopoly of Russia's overland merchants.

The exhibition of a series of excellent views followed the reading of the paper, and Mr. C. H. Moberly, C.E., who is well acquainted with Russia, sent some written remarks, giving a brief history of the attempts to develop communication between the European and Siberian waterways. In 1797, the first survey was undertaken of a line of water communication between the Obi and Yenesei. And already in the 16th and 17th centuries, Russian sealing vessels from Archangel and Kola went to the Kara Sea and found their way to the Obi and Yenesei, either through the Kara Sea or round the North of Novaya Zembla. But the first properly recorded voyage through the Kara Sea was the one made by Captain Wiggins in 1874. Recent data seemed to show that the route round the north of the islands was perhaps better than the southern one through one of the Straits and the Kara Sea, the cold being always more intense near land than in the open ocean. Mr. Moberly had personally, however, little faith in an Arctic route for regular trade. What was chiefly required to develop the resources of Siberia was to improve the waterways in the basins of the Obi and the Yenesei, and either to form an efficient canal route across the Ourals, or else to greatly increase the railway accommodation across these mountains so as to get the Siberian produce into Europe.

The meeting was brought to a close by a hearty vote of thanks to the lecturer, proposed by Mr. J. Wilson Swan and seconded by the Rev. Mr. Arthur S. Thompson, formerly British Chaplain at St. Petersburg, both of whom dwelt upon the spirit of enterprise and patient power of endurance displayed by Captain Wiggins in his useful and important voyages and explorations.

PROCEEDINGS OF INSTITUTIONS.

THE ROYAL GEOGRAPHICAL SOCIETY.

The opening meeting of the new session of the Royal Geographical Society was held on the 11th Nov. The President, Sir CLEMENTS MARKHAM, occupied the chair, and Sir HARRY JOHNSTON delivered an interesting lecture on "The Uganda Protectorate, Ruwenzori, and the Semliki Forest." After describing the various provinces of the Protectorate, he said that the traveller from Mombasa, before reaching the frontier of Uganda, passed through the country of Kikuyu, which was well forested and thickly clothed with vegetation. As he descended into the Rift valley the Kikuyu vegetation decreased in luxuriance. In the vicinity of Lake Naivasha there was a short sweet grass, which was probably kept low by the browsing of innumerable antelopes and the herds of Masai cattle. The Masai of the Naivasha district belonged to the essentially cattle-keeping, semi-nomad division of that race. Quite recently, for political reasons, it had been thought advisable to make the Masai dwelling within the eastern province of the Uganda Protectorate independent of any political connection with those of the adjoining East Africa Protectorate or of German East Africa. Unfortunately, at the present moment the Masai race was on the road towards extinction, either by dying out or by fusion with other tribes. The last year or so, however, there had been a marked increase in prosperity among the Masai of Naivasha, and he was therefore in hopes that in this region they might increase and multiply and preserve their purity of race. From the north-eastern buttresses of Mount Elgon, and the head-waters of the Weiwei river on the north, to the frontier of German East Africa on the south—a distance of about 240 miles—extended, at altitudes ranging between 5,000 feet and 10,000 feet, one of the most beautiful and healthful districts to be found anywhere in the Dark Continent. This lofty region he would style the Nandi plateau, as it was mainly inhabited, so far as it had any human inhabitants at present, by races of the Nandi stock. The scenery on the Nandi plateau reminded the homesick official and traveller, over and over again, of England, of Wales, of Scotland. This beautiful land had not in it a single ugly or unfriendly spot, and as it was almost entirely without native inhabitants it seemed to be awaiting the advent of another race which should make it a wonderland of wealth and comfort, a little England, half a Scotland, or a large Wales, lying exactly under the equator at an average altitude of 4,000 feet above the Victoria Nyanza, of whose silvery gulfs and ghostly mountain coastline strange glimpses at a distance of 90 miles might be caught occasionally from some breezy height, or through the interstices of woods which themselves might be in Surrey. He travelled completely round Mount Elgon. On its southern, as on its northern side, the awful mountain cliffs which marked one of the lower terraces of this tremendous crater were honeycombed with deep recesses or caverns. These were the well-known caves of Elgon, the caves which were first discovered by Joseph Thomson. He visited several caverns, but among others the one which was the first cave reached and discovered by Joseph Thomson, whose visit the natives still remembered vividly. The cave was marked by a splendid waterfall. It was the descent of the Sasuru river, and he would propose to name the waterfall the Thomson Falls. It was hardly necessary to add that Joseph Thomson left behind him there, as wherever else he passed in Central Africa, the most pleasing memories. Fate had ordained that he should often travel in Thomson's footsteps, and he had always noted that where Thomson had been the first white pioneer his admirable treatment of the natives had ensured a kindly welcome to those who followed. The native inhabitants of West Elgon were of the greatest interest. They were of rather a mixed stock, but all were of very low and ape-like appearance. The greatest interest they possessed lay in the fact that they spoke a Bantu language which, of all those discovered, possibly came nearest to the original form of the Bantu mother-tongue.

From the Sabei country he was obliged to travel for 16 days to the ravine station without a road, simply guiding his caravan by the map and eye. From the north-east of Elgon to within sight of the ravine station they passed through a land whose only human inhabitants were a few wandering and fugitive Andorobo—a land simply swarming with big game. They saw large herds of elephants first, then many rhinoceroses, then literally countless hartebeestes, water-buck, reed-buck, Cobus antelopes, bastard hartebeestes, and oribi. Herds of zebras would follow the caravan, snorting and kicking up their heels. There were lions, leopards, warthogs, jackals and many ostriches. Last of all, in the middle of the Gwas'Ngishu plateau, where forests of acacia still lingered, they came upon giraffe, upon that five-horned giraffe which appeared to be a new species of that remarkable animal, and apparently the common form of giraffe between Elgon on the west and Lake Baringo on the east.

After describing Busoga, the Baganda people, and the southern part of Unyoro, the lecturer said that he crossed the Semliki River opposite Fort Mbeni and travelled for three days in the dense Congo forest. He could fully endorse all that Stanley had said about the awesome nature of those appalling woods. He could only say that the whole of his expedition, as well as himself, longed to be out of them, although they were in search of the now well-known Okapi, and of other wonders, some of which were found, and some of which still remain undiscovered. He employed his time in this forest by visiting the Pygmies at home and seeing their little settlements of tiny huts constructed of withies and leaves. He also encountered there those strange prognathous ape-like people who seemed to be a race of pariahs dwelling on the fringe of other tribes. He also ascertained that the real gorilla comes pretty near to the Semliki in its distribution. He had reason to believe that other remarkable discoveries of hitherto unknown mammals would be made besides that of the Okapi. As it was, in that forest they obtained skins of several other beasts new to science. He was accorded the kindest hospitality by the Belgian officials, and given every possible facility for visiting that portion of the Congo Free State. He found the natives everywhere on friendly terms with the Belgian authorities, and the excellent roads and well-built stations, together with abundant supplies of the comforts and necessities of existence from Antwerp merchants, introduced a strange element of civilization into those otherwise trackless wilds.

The south-western part of the Uganda Protectorate consisted of the district of Ankole. A portion of that noble country rose to heights of 8,000 feet and 9,000 feet, and here reappeared the alpine vegetation of Ruwenzori, Elgon, and the Nandi plateau. Among these mountains were scattered almost innumerable crater-lakes, which provided landscapes of exquisite beauty. They nearly all contained fish. The scenery round these crater-lakes was so extravagantly beautiful that he felt that, coupled with the fact that they were in a country possessing a very healthy climate and few inhabitants, they might some time become the seats of small European settlements. The northern part of Ankole was somewhat drier and less equatorial in climate. It had a more parched appearance, at any rate during the dry season, and it fell in altitude. Here there was a certain amount of big game, including buffalo, rhinoceroses, and eland. The people of Ankole, as was well known, consisted of a race of sturdy negroes—the Ba-ito—and an aristocracy of Ba-hima, who were, as Speke, their original discoverer, guessed at once, obviously descended from a Gala, Somali, or other Hamitic stock. As regarded features and complexion, one often saw men and women among the Ba-hima who were more like Egyptians than was the case with the Galas and the Somalis. But, strange to say, the hair of the head was much more woolly and negro-like than was the case with Galas and Somalis. He had seen some men and women so light in complexion that he actually thought they were some of Emin Pasha's refugee Egyptians, until it was proved to him that they had been born and bred in Ankole. These people, no doubt, were the origin of many of the legends of a white race dwelling in Equatorial Africa. Among other points they were remarkable for their domestic cattle, which had more or less straight backs, were of large size, and had enormous horns. On the whole, the breed agreed

remarkably closely with the long-horned cattle depicted in the Egyptian frescoes, and he believed that this race was the stock from which the long-horned South African cattle were derived.

The lecturer concluded with an account of his exploration of the Ruwenzori range of snow mountains. He said that Ruwenzori was still the most mysterious and least known mountain in Africa, and it was certainly, of all African mountains of his acquaintance, that which was the most constantly cloud-covered. He was personally convinced that the highest point of Ruwenzori was not under 20,000 feet in altitude, and that it would, therefore, be found to attain the greatest altitude on the continent of Africa. When, after the most arduous climb he had ever experienced, he reached his highest point on the flanks of the snow range—14,800 feet—the mountain above him seemed a thing he had only begun to climb, and towered, so far as he could estimate, another 6,000 feet into the dark blue heavens. Permanent snow, however, lay as low as 13,000 feet. To effect a complete and successful ascent of the highest points of Ruwenzori required as elaborate a preparation as the exploration of the Andes or the Himalayas. An enormous deal remained to be done in the exploration of this, the most important range of Africa.

Sir Harry Johnston illustrated his lecture with a large number of beautiful lantern-slides made from photographs taken by himself, and created considerable amusement by reproducing by means of the phonograph specimens of native singing.

THE ROYAL AGRICULTURAL SOCIETY OF ENGLAND.

The usual monthly meeting of the Council of this Society was held on the 11th ult., PRINCE CHRISTIAN (president) in the chair.

The chief business before the Council was the settlement of the prize-sheet for the meeting to be held at Carlisle from July 7 to 11, 1902, under the presidency of Prince Christian. The recommendations of the various committees as to prizes to be offered on this occasion were submitted and, after discussion, adopted. The total amount of prizes offered in all departments, exclusive of champion prizes offered by the leading breeding societies, will amount to £6,001. 5s., to which the Carlisle Committee have contributed £1,250, and various breed societies £245. Mr. R. Neville Grenville was appointed a steward of implements, Mr. E. W. Stanforth and Viscount Baring stewards of stock, and Mr. G. H. Sanday, and Mr. F. S. W. Cornwallis stewards of finance for the Carlisle meeting.

Sir Nigel Kingscote reported from the Finance Committee that the financial result from the Cardiff meeting held last June was a surplus of receipts over expenditure of £1,998. 4s. 4d.

Mr. J. Bowen-Jones presented a report from the consulting chemist as to various cases of adulteration in feeding stuffs, and desired to draw the special attention of purchasers of common or undecorticated cotton cake to the increasing practice of putting borax and other chemicals into cotton cake in order to maintain the bright colour of newly crushed cake, which in the case of cakes thus treated passes off on keeping. Cakes thus treated should be avoided by purchasers.

The Hon. Cecil Parker presented a report from the Veterinary Committee with regard to recent outbreaks of anthrax, glanders and swine fever, and stating that the country now appeared to be free both from foot-and-mouth disease and rabies; the last case of the former having occurred on April 12, and the last case of the latter on April 22.

Mr. Richard Stratton moved a resolution expressing the views of the Council that it was highly important that the country should be declared free from foot-and-mouth disease. Mr. Crutchley said he understood that, although the country was actually free from the disease, there were some administrative difficulties about its being officially declared so. Mr. Bowen-Jones said it made a great difference to breeders of pedigree stock, because the Argentine Republic was closed until it had been declared that foot-and-mouth disease did not exist. The Sheep Breeders' Association had asked that this should be done, but up to the present the Board of Agriculture would not say that the disease had ceased to exist, although it had not appeared since April. After some further discussion the following resolution was carried unanimously, and ordered to be communicated to the Board of Agriculture:— "That this Council desires to draw the attention of the Board of Agriculture to the fact that no case of foot-and-mouth disease has been reported in this country since April 12 last, and to express the hope that, under these circumstances, His Majesty's Government may be able to see their way to officially declare the country free from the disease."

Mr. Crutchley reported that, since the constitution of the Site Committee at the Council meeting on November 6, they had had two meetings, at which instructions had been given for the fencing of the new show-yard in the metropolis, and various other matters connected with the site. The sum of £27,853. 3s. 6d. had been promised by 376 subscribers to the fund which the Society was raising for the purchase and equipment of the show-yard. Sir Nigel Kingscote pointed out that, although the amount promised was sufficient for the purchase of the land, it did not make provision for drainage, gas- and water-piping, fencing, and roads, or for the requisite buildings, such as permanent stabling and the more substantial structures of a show-yard. The committee would, therefore, be glad to receive further contributions towards the fund.

Various other reports from committees dealing with other departments of the Society's work were presented, and all the standing committees were reappointed for the ensuing year. Grants of £600 were made to the Veterinary Committee, of which £500 was allocated to the Royal Veterinary College; £200 to the Chemical and Woburn Committee for the expenses of the pot culture station at Woburn; and £400 to the Education Committee. Other business having been transacted, and the report of the general meeting having been settled, the Council adjourned over the Christmas recess until Wednesday, February 5, 1902.

THE AFRICAN SOCIETY.

At a meeting of the Council of the African Society held on the 13th ult., the following were duly elected Members:—

James Bell, A.I.N.A., Frank Norman Best, F.R.H.S., R. B. P. Cator, H.M. Judge East African Protectorate, Walrond B. Clarke, Albert Gray, George B. Hunter, J.P., L. Kentish Rankin, District Commissioner Northern Nigeria, A. D. Mackinnon, C.M.G., M.D., William Matthews, C.M.G., Mrs. Frank Melland, C. W. Perryman, J.P., James T. A. Stopford, Harry R. Tate, and Dr. A. Zimmerman.

At the same time the following gentlemen were proposed for election:—

Herr de Bloeme, Nieuwe Afrikaansche Handels-Vernootschap, Rotterdam; William Waters, S. M. Gluckstein, Editor of *West African Year Book*, S. Vaughan Morgan, F. Bohn, Co. Francaise de l'Afrique Occidentale, Marseilles; A. Guichard, Co. Francaise de l'Afrique Occidentale, Manchester; A. Pourrière, Co. Francaise de l'Afrique Occidentale, Liverpool.

Railways in Southern Rhodesia.—The *Board of Trade Journal* states that a despatch has been received from the High Commissioner for South Africa giving the following particulars relating to the railways at present being constructed in Southern Rhodesia:—(1) A line, 3 ft. 6 in. gauge, from Bulawayo, through Gwelo to the Globe and Phoenix Mine—150 miles long; (2) a line, 3 ft. 6 in. gauge, from Salisbury to the Globe and Phoenix Mine—150 miles long; (3) a line, 2 ft. gauge, from Salisbury to the Ayrshire Gold Mine, Lomagondi district—78 miles long; (4) a line, 3 ft. 6 in. gauge, from Bulawayo to the Gwanda district, Matabeleland—120 miles long; (5) a line, 3 ft. 6 in. gauge, from Bulawayo in the direction of the Wankies Coalfield and Victoria Falls—160 miles long. The Administrator of Rhodesia states in regard to the last of these lines that it is intended to extend this line through the Wankies Coalfield to the Victoria Falls, and thence across the Zambesi, but as the survey has not yet been completed, no contract for the extension has been given.

COMMERCIAL INTELLIGENCE DEPARTMENT.

CORRESPONDENCE AND ENQUIRIES.

The following are given as specimens of some of the enquiries which have been addressed to, and satisfactorily answered by, the Institute during the past month (December).

* * *All communications must be authenticated by the name and address of the writer. Enquiries which would involve special applications or expense will be a matter of arrangement with the correspondent.*

M. & Sons, Ltd., London.—Duty on carriages into New Zealand.
 P. W. L. A., Staffs.—Museums in the colonies.
 H. A. B., London.—General information on the colonies.
 L. R. K., London.—Flax-growing.
 E. F. P., London.—Engineers, boilermakers, etc., in the colonies.
 C. E. C., London.—Cultivation of pimento.
 F. A. G., London.—Obtaining valuation of various minerals.
 Verbal.—Victorian fibres.
 " New Zealand hemp.
 " Sheep farming in the Argentine Republic.

REQUIREMENTS REGISTRY.

In order to provide correspondents with an opportunity of making known special "wants" or "needs" in the British Colonies, India, and Foreign Countries, space will be regularly devoted to the publication of approved notices in the *IMPERIAL INSTITUTE JOURNAL*. Notices, as a rule, should not exceed 25 words in length, for which a charge of 2s. 6d. will be made for each insertion. Special arrangements can be made for longer notices.

SPECIMENS OF FOREIGN AND COLONIAL WOODS desired. Purchase or exchange. Names and localities must be well authenticated. Address—HERBERT STONE, BRACEBRIDGE-STREET, BIRMINGHAM.

THE CURATOR OF THE CANADIAN SECTION OF THE IMPERIAL INSTITUTE is prepared to furnish information about Canadian Trade and to supply names of importers, manufacturers, shippers, etc.

The following trade enquiries have been received at the Canadian Section of the Imperial Institute, from the Curator of which Section further particulars may be obtained:—

Home Enquiries.—A West of England firm of importers and manufacturers' agents could advantageously represent Canadian manufacturers of turned goods, boxes, hardwood blocks, brush backs, furniture seats, and hardware.

A London firm desires to hear from Canadian manufacturers of chair parts who can quote prices and fill orders.

A manufacturer of gelatines, greases, glues, etc., asks to be placed in communication with responsible Canadian importers of these articles.

Canadian Enquiries.—A Canadian manufacturer of wire mattresses asks to be placed in communication with United Kingdom importers who might be prepared to contract for regular supplies of these goods. Price lists furnished on application.

A Montreal house engaged in the metal trade wishes to secure the agency of a first-class manufacturer of steel rails, for which they report a good opening.

The Canadian owner of large timber properties situated in Labrador asks to be placed in communication with United Kingdom firms interested in the purchase of timber lands.

A Canadian company which has commenced the manufacture of wood flooring would be pleased to hear from United Kingdom buyers of this material.

A Canadian manufacturer who is about to undertake the production of mineral water wood caps seeks information regarding demand for these articles in the United Kingdom, and asks to be placed in communication with importers.

A Canadian manufacturer of church and school furniture of all kinds, chairs and other furniture, desires to be put in communication with United Kingdom importers of these goods.

A Canadian company which has commenced the manufacture of wood flour would be pleased to hear from United Kingdom buyers of this material.

A manufacturers' agent, who is established both in London and Canada, is in a position to represent a few United Kingdom houses who wish to develop trade in Canada.

A Canadian Canning Company is in a position to fill orders for canned vegetables, pork and beans, chicken, turkey, soups, etc., and asks to be placed in communication with importers of same open to place orders.

MAPS AND CHARTS.—RECORDS.

[The entire collection of maps (with the exception of a few atlases and maps issued by private firms) consists of authoritative publications of the various government cartographical departments. Such as: the One-inch Ordnance Survey of Great Britain and Ireland, a complete set of Admiralty Charts, and a selection from the maps compiled in the Intelligence Division of the War Office; the monumental "Indian Atlas," and a large number of the publications of the Surveyor-General's Office, Calcutta; the Geological Survey of Canada, and the Government Surveys of Victoria and New South Wales. In the arrangement of the collection, the geographical classification of the War Office Intelligence Department catalogue has, with some modifications, been followed.]

ADDITIONS TO THE COLLECTION OF MAPS DURING DECEMBER, 1901.

EGYPT.

MAP of EGYPTIAN SUDAN. No. 1489.—Sheets, Wadi Halfa, Murat, Kosha, Wadi Keheli, Dongola, Kagmar, Ma'atuk, El Obeid, Abba Island, Jebel, Fashoda, Middle Sobat, Nasser, Setit, Gore, and Akobo.
 BEBER to VICTORIA NYANZA.
 SKELETON MAP of SUDAN.

AFRICA.

I.D.W.O.

Presented by the Director of Military Intelligence.

WORLD.

W. & A. K. Johnston, Ltd.

"NAVY LEAGUE" MAP of the WORLD. This production is primarily intended to illustrate British Naval History. It shows British trade routes and steamship lines, with distances between various important ports, and includes statistical information regarding the wealth and social condition of the British Empire, the value of its sea-borne commerce, sources of its food-supply, etc.

Presented by the Publishers.

CHARTS AND PLANS.

Published by the Hydrographic Department, Admiralty, during September and October, 1901; J. D. POTTER, Agent, 145, Minorities, London.

No.

New Charts.

- 3192 Scotland, west coast:—Loch Broom, upper portion.
 3104 England, east coast:—Hartlepool to Blyth.
 3212 Ports on the east coast of Italy:—Port of Aneona.
 3197 Cuba:—Mevitas bay. Entrance channel.
 3213 Plans on the north coast of Brazil:—Port Timonha. Port Camocim.
 1921 Plans in the Indian Ocean:—St. Paul island. Amsterdam island.
 3214 Red sea. Suez bay:—Ports Ibrahim and Thewfik.
 1143 Anchorages in Malacca strait:—Wanderer bay. Arang Arang anchorage (*Republication*).
 3209 Bays and anchorages in Makassar strait.
 1578 Japan:—Simonoseki strait.
 3196 Harbours and anchorages on the west coast of Nipon, Japan.
 3200 Japan:—Aikappu Misaki to Rebun islands. (Plans:—Kabuka Biochi. Oniwaki Biochi. Teshio Gawa-Gashi.)
 3198 Russian Tartary:—Askold island to Cape Povorotni.
 3222 Russian Tartary:—Rikorda island to Larionoff point.
 1062 Australia, south coast:—Rivoli bay to Cape Otway.
 1014 Australia, south coast:—Cape Jervis to Rivoli bay.
 1383 Islands and anchorages in the south-east Pacific Ocean:—Juan Fernandez. Cumberland bay. Mas o Fuera island. St. Felix and St. Ambrose islands. St. Felix road (*Republication*).
 2194 Anchorages in the northern part of Celebes. New plans:—Bolang Uki bay. Sumalata road. Himana bay. Pienehang bay. Domisil bay. Paleli and Lintidu roads.
 208 Japan:—Harbours and anchorages on east coast Nipon. New plan:—Uchiura Wan.

Charts that have received additions or corrections too large to be conveniently inserted by hand, and in most cases other than those referred to in the Admiralty Notices to Mariners.

HONG KONG.

In the annual report on Hong Kong, the Governor, Sir H. A. Blake, refers to the sound financial position of the colony, and states that its business, which is mainly that of a great transshipping port, continues to increase with the expanding trade of the East. Referring to the Boxer troubles, the Governor points out that Hong Kong was practically the British base, and incidentally states that the conduct of the Indian troops landed there left nothing to be desired. A paralysis of general trade was caused by the outbreak of hostilities, and the godowns in Hong Kong and Shanghai were filled to overflowing with imported merchandise, of which the Chinese merchants were slow to take delivery. The Governor refers to the outbreak of plague at the end of February, which lasted twenty-seven weeks. There were 1,080 cases, and the mortality was 95.5 per cent. A severe typhoon in November is also reported, during which H.M.S. *Sandpiper* and a large new dredger from England were sunk. Ten launches and over 110 junks were also wrecked, and more than 200 lives were lost in about three hours. In consequence of the difficulties which beset them on account of the strained interpretation by the Imperial Maritime Customs of the inland navigation agreement, the Governor points out that the large river steamers which traded between Hong Kong and the West River Treaty Ports were withdrawn during the year.

Regarding the revenue of the colony, the Colonial Secretary at Hong Kong states that a steady increase has been shown during the past five years, which has more than counter-balanced the increased expenditure. In 1895 the balance of revenue over expenditure showed a deficit of 486,144.12 dollars. In 1900 not only had this deficit been made good, but, notwithstanding an expenditure exceeding that of 1895 by 655,904.12 dollars, the revenue of Hong Kong showed a surplus of 574,140.37 dollars. The actual revenue for 1900 was 3,235,329.61 dollars, exclusive of the amounts derived from land sales and the water account, which amounted to 816,222.92 dollars and 151,034.87 dollars respectively. The expenditure amounted to 3,623,447.13 dollars, of which 473,205.89 dollars was on public works extraordinary. The total import trade of the port for 1900 amounted to 23,205 vessels, of 8,626,614 tons, carrying 6,342,138 tons of cargo, of which 4,198,389 tons were discharged at Hong Kong. This does not include the local junk trade. The net increase in imports thus amounted to 422,717 tons. In exports there was a decrease of 70,666 tons. The chief articles of import are coal, rice, sugar and flour; tea, kerosene, rice and paddy, and general cargo are the principal exports. There has been a great increase in the amount of sugar imported, no less than 76.6 per cent.; also in timber, coal, flour and hemp. The trade in bulk oil is almost at a standstill, but case oil shows a decrease of 10,609 tons. The rice trade has diminished by 98,801 tons, and may now be said to be at its normal condition. The population of the colony, at the census taken in January, 1897, was 248,880, while at the census taken in January, 1901, it was 283,975, exclusive of the army and navy, which amounted to 13,237. The population of the new territory, which is exclusively Chinese, was estimated at 100,000 in the year 1899.

New docks are projected, one of which will accommodate the largest ship afloat, and the existing docks are being enlarged, so that "the docking facilities of the port will in the near future, equal, if not exceed, those of any port in the East." The building of steam launches proceeds apace, and the Governor doubts whether better or cheaper launches are built in any part of the world. The enormous traffic of the colony renders it peculiarly difficult to deal with the introduction of the plague from without, especially as a few hours brings crowds of coolies from the neighbouring plague-infected mainland. Overcrowding is one of the pressing problems of the time; in one district the population is 640,000 to the square mile, and this in a city crowded under the precipitous northern slope of a range of hills that effectually shut off the south-easterly breezes of the summer months. The main difficulty is that the value of houses and land is so great that the opening of new streets must be very costly; nevertheless, "sooner or later the question of the abatement of surface overcrowding must be vigorously dealt with."

JOHOR.

The following information respecting the State of Johor has been recently received from the Hon. Dato J. Meldrum, the Corresponding Agent of the Institute:—

JOHOR.—Until the projected railway is made through Johor and connected with the railways of the Federated Malay States and the line from Singapore (14 miles) is finished, no great developments, such as have been made in Perak, Selangor, Pahang, Negri Sembilan, etc., may be expected. Land for new gambier and pepper plantations is not to be had near the water; besides, it is difficult to procure Chinese coolies, owing to the high rate of wages prevailing in the tin-producing States of the north, and other reasons.

The population may be said to be about 200,000, mostly Chinese. No census has ever been taken. The few Malays that govern the country are, perhaps, as well qualified for the task as their neighbours. There are a few British subjects, not more than thirty including children. It is now forty-one years since the first European came here to make it his place of permanent residence: he erected the Johor Steam Saw Mills (which are still actively employed). A few years afterwards, in the sixties, the late Sultan Abubakar came to reside; he built an istana and the town of Johor Bahru or New Johore sprang up; his father, the Tumpongong of Johore, resided at Telloh Blanga in Singapore. The present Sultan Ibrahim (a tall, handsome young man 26 years of age) is at present on a tour through the Continent of Europe.

According to the official statement of imports and exports issued by the Government of the Straits Settlements for the year 1900, it appears that the exports from Johor into

Singapore amounted to \$9,697,310; this included bullion, specie and silver coin (dollars) valued at \$270,937. The principal articles were gambier, pepper, sago, tapioca, manufactured and raft timber, rattans, tin ore, fish, fruits, coffee, areca nuts, copra, preserved pine-apples, gutta percha, etc.

The imports from Singapore into Johor amounted to \$6,241,403, including silver coin to the amount of \$3,021,615, so it is stated. The chief imports were fish, rice, poultry, swine, grains, flour, provisions, sugar, tea, tobacco, oils, manufactured articles, cotton goods, hardware, iron, joss paper, lime, tools, matches, machinery, beer, spirits, gunpowder. Opium, from which the revenue is chiefly derived, is not mentioned, neither is copper coin—nor various other items—many of foreign make. When the Trans-Continental Railway from Adelaide to Port Darwin is finished (2,000 miles) and the line from Singapore to India (1,600 miles) is made, Johor will participate in the advantages and possibilities that Singapore will enjoy in, it is to be hoped, the near future.

NEW BOOKS, etc.

CASSELL AND COMPANY, LIMITED. (London, 1901.) *The Earth's Beginning.* By Sir ROBERT STAWELL BALL, LL.D., F.R.S. With four coloured plates and numerous illustrations. 8vo., pp. 384. (Price 7s. 6d.) The author of this attractive book is well-known for the excellent lectures he gave to a juvenile audience at the Royal Institution during the last winter, in which he presented his hearers with a clear and popular exposition of that branch of astronomy which treats of the evolution of the earth, the planets, and the sun from the primitive "fire-mist." With some omissions and additions these lectures are set forth in the present volume, which will be read with much pleasure by all who are interested in the subject. To bring the stupendous facts and intricate problems of astronomy within the comprehension of children is no small intellectual feat, and the striking and familiar illustrations with which Sir R. Ball elucidates his discourse add greatly to the interest of the work. The book is written in a popular style with very few technicalities, so that the theories mentioned may be grasped readily by non-scientific readers. The doctrine of the evolution of our solar system from its nebula is well and clearly stated, and a graphic description is given of the volcanic eruption of Kra-Katoa in 1883, of which two artistically coloured illustrations are inserted in the volume. The study of astronomy does not receive the attention it deserves as a means of correcting wrong conclusions regarding the universe which are often met with. There are still many ill-educated persons who believe that the earth is flat, and who have but very vague notions of the firmament around them. The late Mr. R. Proctor did much to popularise the study, and to dissipate false ideas, but Sir R. Ball has presented the subject in so pleasing a manner that his book cannot fail to arouse the keenest interest, and to induce its readers to pursue further the study of this fascinating and wonder-revealing science.

CHARLES GRIFFIN AND COMPANY, LTD. (London, 1901.) *Year-Book of the Scientific and Learned Societies of Great Britain and Ireland, 1900-1901.* Eighteenth annual issue. Compiled from official sources. 8vo., pp. 347. (Price, 7s. 6d.) The issue of this Year-book has been made to coincide with the termination of the sessional year (September to June) instead of with the calendar year, as heretofore. The present edition has therefore been enlarged in order to fill the gap of six months which would otherwise have been created, and the lists of papers now given comprise, with few exceptions, those read before the various Societies during the eighteen months which have elapsed since the last issue, viz., January, 1900 to June, 1901. This alteration will be most useful and increase the value of the Year-book as a work of reference to those engaged in literary and scientific work.

HAZELL, WATSON AND VINEY, LTD. (London, 1902.) *Hazell's Annual for 1902; a Cyclopaedic Record of Men and Topics of the Day.* Revised to December 6th, 1901. Edited by W. PALMER, B.A. (Lond.). Seventeenth year of issue. Sm. 8vo., pp. 732. (Price 3s. 6d.) This well-known and most useful annual makes, as usual, an early appearance, and is quite up to date in all respects, showing the same careful editing as in previous issues. The present edition is greatly improved by a re-arrangement and consolidation of the articles relating to foreign countries. New articles have been inserted on the Armies and Navies of the World, the Trade of the World, the Mercantile Marine, Minerals, Railways, Industrial Trusts and Engineering schemes of the World. New Maps are given of the North-West frontier of India, showing clearly Russia's position with regard to Afghanistan; of Turkey and the Balkan peninsula; and of the projected Isthmian Canal routes in Central America. An article on the Triple Alliance sums up the known facts with regard to that combination of Powers which has been, and will be, much discussed in connection with the new Customs Tariff of Germany and the approaching expiration of the European Commercial Treaties. The important events in China during the year are recorded, and the Peace Protocol is given in full; the substance of the Canal Treaty with the United States is also inserted. Colonial affairs have received a large share of attention. The constitution of the Australian Commonwealth and a description of the inauguration ceremony will be found under "Australia," and the tour of the Prince and Princess of Wales and their reception by the Corporation of London on December 5, are duly recorded. New articles on home affairs have been added to the book, such as the Coronation Ceremony of 1902, the new Civil List, the 1901 Census, Factory and Workshop Act 1901, etc. Nothing of any importance has been omitted. The quantity and variety of information to be found in this Annual render it unrivalled as a work of reference; it has become indispensable both to the politician and the writer, and will be found a most useful desk companion.

HIND, HOYLE AND LIGHT, LTD. (Art Publishers, Manchester, 1901.) *Port of Manchester; a Sketch of the History and Development of the Manchester Ship Canal and Formation and Growth of the Cotton Association.* By W. BURNETT TRACEY. Folio, pp. This handsomely illustrated volume presents an excellent idea of the magnitude and importance of the Manchester Ship Canal, a work which has contributed and will continue to contribute greatly to the prosperity of the city. A special chapter of the volume deals with the rise and growth of the Manchester Cotton Association, which benefits largely in the direct importation of cotton by means of the canal. The engineering details of the work of constructing the canal have been written by Sir E. Leader Williams, the engineer-in-chief, and now consulting engineer to the company, and two introductory articles are given, one by Mr. W. H. Linton on the movement and its pioneers, the other by Mr. F. E. Cornwall on the early pioneers of the ship canal. The history and development of the canal are well recounted by Mr. Tracey, and this book forms a splendid souvenir of one of the greatest engineering feats of modern times. The illustrations, which are all from photographs, are admirably produced; the printing and binding are all that could be desired.

JOHN MURRAY. (London, 1901.) *The Growth of the Empire, a Handbook to the History of Greater Britain.* By ARTHUR W. JOSE. With 31 maps. 8vo., pp. xv. + 422. (Price, 6s.) This book was first published in Sydney, and already several editions of it have appeared in Australia. It is written by an Australian, and contains a concise account of the growth and development of the British Empire from its beginning in the time of Elizabeth down to the present day. The subject is of too vast dimensions to be fully discussed within the compass of a single volume of 400 pages. To those who have not time to peruse more lengthy histories, the book will convey a very clear and interesting account of the colonisation of various parts of the globe by the British race. This history has often been written, but, as in Mr. Jose's work it is viewed from a special standpoint, it contains much that is new and informing. The last chapter is perhaps the most important, as it gives the author's views respecting recent imperial developments. An appreciative note is made with regard to the statesmanship of Mr. Cecil Rhodes, as displayed in the extension of British power in Africa, and the formation of a British South Africa dominion. The author concludes by saying that at last we begin to see

the scheme of the Empire. "India is the central motive of its expansion. To reach India our adventurers threw themselves upon America; to guard Indian trade we seized South Africa; upon India converge the routes that are dotted from end to end with our forts and coaling stations. The Empire means that we are a stage beyond the rest of the world in national evolution. We, of the English-speaking communities, have been set to build this new structure, this house among tents; that we build it rightly and maintain it undisturbed is work necessary not only for the safety of the Empire, but for the orderly development organized." A list of colonial articles of the more important treaties to which Great Britain has been party, is given in an appendix to the volume, and numerous outline maps, which are well and clearly drawn, are inserted to illustrate the text.

WITHERBY AND CO., London. *The Royal Navy List, Diary and Naval Handbook for 1902.* Issued in conjunction with *Lean's Royal Navy List*. La. 8vo., pp. 120 + 408. (Price 3s.) This useful Diary and Handbook contains much valuable information respecting the Royal Navy and nautical matters, with a calendar of notable naval events, and a complete obituary for the year. Mr. L. G. Carr Laughton has again contributed an article on the Naval Progress of the Year, which is accompanied by a comparative table of battleships of the Naval Powers. This is the fifth annual issue of the Diary and Handbook, its compilation has been carried out with much care and attention with a view to correctness and reliability, and as a work of reference and record it will be of great service to all connected with the Navy.

The Journal of the African Society. (MACMILLAN AND CO., London.) We have received a copy of the initial number of the *Journal of the African Society* (October, 1901). This Society has recently been founded in commemoration of the work of the late Miss Mary Kingsley, to investigate the social condition of the native races of Africa, and to facilitate the commercial and industrial development of the continent in the manner best fitted to secure the welfare of its inhabitants. The *Journal* of the Society has been issued in furtherance of these objects by collecting and publishing information received from competent writers, and, judging from the articles contained in the first issue, it appears likely to meet with great success. The number commences with an appreciative tribute to the genius of Miss Mary Kingsley and her work in West Africa, written by Mrs. J. R. Green. Sir H. H. Johnston contributes some notes on African subjects of special interest, and Dr. Hagberg Wright gives an account of German methods of development in Africa, showing the advantages of Government aid and direction in fostering the growth of rising colonies. The article on British trade with West Africa, by Mr. J. W. Root, indicates the value and importance of this market to British merchants. The experiment of giving a vote to the natives of Senegal is amusingly described by Mr. Pierre Mille, and this is followed by "Some glimpses of West African Law and Custom," by Colonel Stopford, and a well-written account of "Taveta Customs," by Mr. Claud Hollis; while Major Spielsbury records his observations made during a journey with an expedition from Port Amelia, in Delagoa Bay, to Lake Nyassa, in August, 1900. It will be seen from the foregoing that the contents of the *Journal* are both varied and attractive, and it should prove most useful in spreading a better acquaintance with the inhabitants of the Dark Continent and their habits and ideas. Many of the troubles that have arisen with the natives have been owing, in a great measure, to not knowing how best to deal with them. The African Society will be doing good service in removing this ignorance.

CITY BRANCH OF THE IMPERIAL INSTITUTE, AT 112, CANNON STREET, LONDON, E.C.

The CITY BRANCH OF THE IMPERIAL INSTITUTE embraces:—

1. A News Room, supplied with:—

- (a) The chief British Industrial and Commercial Periodicals;
- (b) Many United States, German, and French Commercial Periodicals;
- (c) Commercial Periodicals of the principal Colonies and of India;
- (d) Market reports, prices-current, and statistics.

2. An Enquiry Office, in telephonic communication with the Commercial Information Office of the Imperial Institute at South Kensington. Enquiries relating to industrial, commercial, and other matters connected with the Colonies, India, and Foreign Countries, are received and promptly dealt with, and samples of products from the Colonies and India, stored at the Imperial Institute, can be inspected or obtained. Expert valuation will be furnished of samples submitted for that purpose.

3. The News Room is *free to Fellows* of the Institute, as is also the Enquiry Office for obtaining such information as does not involve special research or correspondence.

4. A *subscription* of the sum of one pound per annum, payable in advance, secures the *free use* of the News Room, and the supply, free of charge, of information not involving special research or correspondence.

5. Subscribers of one pound per annum are also entitled to inspect, *free of charge*, any maps or charts included in the Map Room collection at the Imperial Institute, South Kensington, and to consult any works, or official papers, included in the Institute Library. Passes admitting to the Library or the Map Room for the foregoing purposes will be issued, as required, on application to the Clerk at the City Office.

6. *Non-Subscribers* to the City Branch can be supplied with information upon the following terms:—

- (a) *First enquiry*, not involving special research or correspondence, *free*.
- (b) For each subsequent enquiry, not involving special research or correspondence, one shilling.
- (c) For each enquiry, involving special correspondence, or interviews with home-experts, etc., five shillings.
- (d) For each enquiry involving Colonial or Foreign correspondence, ten shillings; or by special arrangement, if likely to be voluminous.

7. *Subscribers* will have to pay the charges specified under (c) and (d) in the foregoing clause: *Fellows* will only be required to reimburse the Institute any out-of-pocket expenses incurred in connection with enquiries coming under those heads.

8. The Information Department will undertake to obtain analytical or other examinations of samples by competent Experts, upon payment, by persons submitting them, of the usual professional fees, to be previously specified, and agreed to by the applicant.

9. The Institute will undertake to procure, and supply, at cost price, translations into any language, of trade circulars, prices-current, etc., and the conversion of weights, measures, coinages, etc.

MONTHLY COMMERCIAL AND INDUSTRIAL SUMMARIES.

GENERAL COMMERCE AND INDUSTRY.

UNITED KINGDOM.

British Corn.—The following statement gives the average price of British Corn during the four weeks of December, 1901, as compared with December, 1900:—

1900.			1901.		
Wheat.	Barley.	Oats.	Wheat.	Barley.	Oats.
26/10	25/11	17/4	27/1	26/7	19/-
26/9	25/7	17/1	27/2	26/8	19/3
26/7	25/7	17/2	27/7	26/8	19/8
26/4	25/10	17/2	27/7	26/8	19/10

Enquiry into Foreign Methods of Commercial and Industrial Education.—A movement is on foot to send out a commission of enquiry to investigate methods of education on the Continent and in America, with special regard to their bearing on questions of commerce and industry. Mr. Alfred Mosely, C.M.G., who has been struck in the course of his business experience by the fact that Englishmen are very frequently less well prepared than Germans or Americans for the tasks of commercial and industrial life, is disposed to attribute this inferiority of equipment to differences of school training. Conscious, however, of the great complexity of the problem and of the variety of factors which need to be taken into account in any consideration of it, he proposes to defray the whole expense of a commission of enquiry, which would visit parts of the Continent and of America to study the question.

A number of gentlemen met under the presidency of Lord Reay, Chairman of the London School Board, to confer with Mr. Mosely as to the organisation of the enquiry; amongst them being Sir Joshua Fitch, Sir A. L. Jones, K.C.M.G., Mr. Sidney Webb, and Dr. W. Garnett (Chairman and Secretary of the Technical Education Board of the London County Council), and Mr. Graham Wallis (Chairman of the School Management Committee of the London School Board). It was decided that the enquiry should take place in the autumn of 1902. It is understood that the promoters of the enquiry will endeavour to secure the co-operation of a number of public men representing various types of educational authorities and also the interests of industry and commerce.

COLONIES.

Canadian Tinned Fruits.—Reuter states that the Canadian Packers' Association has determined to adopt active measures to develop the trade in canned fruits and vegetables of Canadian growth and manufacture in Great Britain. Stores for their sale will be opened in the leading centres in England, Scotland, and Ireland, and energetic efforts will be made to bring Canadian canned goods to the attention of British buyers.

Canadian Wood for Paving.—There seems likely to be a demand in the near future for Canadian wood for paving in England. The city engineers of Westminster and Liverpool, as a result of recent experiments, have pronounced in favour of Canadian tamarac and white spruce, and a number of authorities in other cities endorse their opinion. Canadian red pine is also recommended, and is pronounced to be equal to and cheaper than Baltic red wood. Some Canadian blocks laid in Trafalgar-square in 1896 have been found quite sound after five years, and worn away only $\frac{3}{8}$ of an inch on the average. Mr. Rust, city engineer for Toronto, says cedar has been found the best adapted of Canadian woods for street paving, but the tamarac and spruce of the maritime provinces are harder than what is found in the West, and the supply for export to Britain would naturally come from there. The wood is treated with creosote before being laid.—*Canadian Engineer.*

Export of Canadian Horses.—The export of horses from the United States has risen in value from 3½ million dollars in 1896 to 7½ million in 1900. Commenting on this rapid growth, the *Canadian Gazette* remarks that Canada has the same number per thousand of the population as the United States, and should have sent abroad during the last six years in round figures 245 thousand horses and have received 30 million dollars for them, or, according to Premier Ross, half the value of the horses in Ontario. Our contemporary urges that more attention should be given to the export of horses from the Dominion, and suggests that the Canadian Government should introduce legislation for the improvement of horses and cattle, in Canadian no less than in Imperial interests, by giving prizes and subsidising Canadian bred and imported stallions and sires of registered stock of other breeds; also, wherever necessary, by placing these or their progeny at free service in those districts where the stock is bad or where the farmers are too poor to help themselves. Although late in the day, by putting a stop to the use of "scrub" the trade may yet be rescued. Canada's only chance of successfully competing with other countries is by improving the whole of the live stock of the Dominion.

INDIA.

India and East African Trade.—EXHIBITION IN BOMBAY.—With a view to bringing before those interested in the Bombay cotton and spinning industries the desirabilities of accepting the East African coast as a new market for their wares, the committee of the Bombay Millowners' Association held an exhibition of textile fabrics imported from East African ports. The exhibits comprised sheetings, and a large variety of plain and coloured prints used for the making up of such clothing as is worn by Somalis and other races inhabiting the coast and the neighbouring islands. The fabrics from these markets were mainly of American and German manufacture, with here and there a sample of goods exported from England or Holland. The sheetings shown were almost all of American make, while the Germans were shown to have the best hold of the coloured print trade. Each exhibit was carefully marked with its source of manufacture, the purposes for which it was used, and the selling price in the particular market from which it had been obtained, which details afford those connected with the Bombay mills an opportunity of arriving at a conclusion in regard to the point now being brought to their notice, namely, that there is an opening for them to manufacture locally articles similar in design and workmanship to those on exhibition, and at a price that, after allowing for freight across the Indian Ocean, should enable the goods to be landed in Africa at prices much lower than those ruling in those markets for American and Continental fabrics.

FOREIGN COUNTRIES.

American Bank in St. Petersburg.—For some time there have been rumours of the founding of an American Bank in St. Petersburg. These rumours have now been substantiated. The syndicate of American capitalists will supply the new bank with a capital of 6,000,000 dollars, and the bank will be called the American Bank of the North.—*Constantinople Chamber of Commerce Journal.*

American Trusts and Mexico.—The North American Trusts are making themselves felt in Mexico in a most important fashion. Since the beginning of autumn of this year proposals have been made by New York firms to the most important mines in Mexico for handing over their business to a syndicate, which has already absorbed most of the smelting works; the breweries will also soon be monopolised by an American company, and the same also applies to the Mexican tobacco cultivation, the products of which are largely used in Hamburg and Belgium. In petroleum, shoe manufactures, tanneries, etc., the American interests are the most powerful, and, lastly, the English owners of shares in Mexican railways are in negotiation with an American Trust which desires to possess their shares.—*Handels Museum.*

Argentine Republic.—INDUSTRIES.—It appears from the Buenos Ayres *Herald* that Argentina has advanced beyond the pastoral stage, and is manufacturing a fair quantity of the goods it used to import. Now it not only grows wheat for export in great quantities, but it has flour mills which produce a good article for the home market. It has not only the wool, but wool fabrics as well. To-day blankets made in Argentine factories from Argentine wool are really the standard article in the market, and the imported article finds a sale only among those whose pocket-books are long. The country is making cotton fabrics, it having been found profitable to import the fibre or yarn for that purpose. Both in wool and cotton pretty nearly everything in the line of underclothing may now be had of Argentine make. Imported duck, indeed, is now almost an unknown quantity, having been widely supplanted by the home product. But the list of new and multiplying national industries does not end here. Breweries and distilleries are so numerous and self-evident as not to cause a special mention. Argentina is even making the bottles and demijohns in which the products are distributed. It is making the greater part of the porcelain-covered iron ware that is so common in every house. It is becoming a large manufacturer of boots and shoes of all kinds, though as yet it has no records to boast of in the way of tanning leather. Its hides go abroad, are there tanned, and the latter comes back to be made into shoes. Even ice, which formerly was imported by the shipload, is now an artificially produced home product, and that at a price much less than what it used to be.

Bulgarian Commercial Correspondents.—It is reported from Sophia that the Bulgarian Ministry of Commerce has resolved to appoint Commercial Correspondents in the great European trade centres, and as soon as possible in Austria and Hungary. These correspondents are to be selected from the well-known and respectable commercial classes. Some are to be appointed directly at Buda-Pesth, and it will be their duty to keep the Bulgarian Government informed as to the course of trade, and to forward the use of Bulgarian products. The Government has already appointed such officials in Paris, Odessa, and Antwerp, under the name of Bulgarian Trade Agents, and the present Minister of Commerce proposes to considerably extend their number.—*Handels Museum.*

Japanese Cotton Examination Bureau.—The Chamber of Commerce in Kobe has made a proposal to the Japanese Government to establish a bureau for the purpose of examining and classifying cotton. Amongst the hundreds of thousands of bales of cotton which are annually imported into Kobe there are a large number of inferior quality, and the difficulties which importers are caused in consequence, are proposed to be lessened by the work of this bureau.—*Handels Museum.*

Japan.—SHIPBUILDING.—The Japanese shipbuilders have made a favourable advance in recent years, as demonstrated by the fact that they build ships not only for use in their own country, but also some of large tonnage for foreign nations, as for instance a steamer of 700 tons register for the Customs Department at Shanghai. Still, in 1899, the number and tonnage of ships built in Japan (112 ships with a tonnage of 20,375) was smaller than that of those which were constructed abroad for Japan, namely 271 ships with a total of 39,847 tons.—*Handels Museum.*

Mexican Commerce.—Recent reports show that the commerce of this country is making rapid strides. The total value of the imports and exports has risen from 397,139,582 fcs. in 1894-95 to 683,506,882 fcs. in 1899-1900. During this period of six years, imports have increased 44 per cent. and exports 39 per cent. Most of the imports come from the United States, with an amount of 31 million gold pesos, then from England with 10½ million, then come France and Spain. It is evident that Mexico, with a population of 13 millions, which has enjoyed peace for 25 years, has a great future in store. The trade in six years has nearly doubled, and the financial position is good. There are 14,572 kilometres of railways and numerous important towns with a large demand, and also several good harbours on the sea coast.—*Handels Museum.*

Samples Museum in Brazil.—Official reports state that in the year 1902 a permanent Sample Museum will be established in Bella Novizonte, in the State of Minas, which is considered one of the most important in the Brazilian Union; it will contain agricultural and industrial products, and foreign countries are to be allowed to exhibit.—*Handels Museum.*

Soap Trade in Tripoli.—The large demand for soap in Tripoli is mostly supplied by imports from France, Italy, Tunis, Malta and Crete. French soap costs 36, and Italian only 28½ francs per 100 kilograms. Whilst formerly Marseilles was the principal source of supply, Italy now competes very successfully, owing to its lower scale of prices. The quality from Tunis is also too dear to compete advantageously with the Italian. The quantity of Maltese and Cretan soap is not very large.—*Handels Museum.*

Sugar Refinery in European Turkey.—In the neighbourhood of Adrianople a sugar refinery is being erected, the concession having been obtained by a high Turkish official (Reouf Pacha). All materials necessary for building and machinery are to be admitted duty free. Also it has obtained at the same time a concession for opening a deposit of coal which has been discovered in the vicinity of the refinery, and which will furnish the necessary fuel. The beet-root will be grown on the lands adjoining. The necessary machinery has already been ordered from European factories.—*Handels Museum.*

Trade in the Philippines.—A German trade society reported that although the pacification of the Philippine Islands has not yet been accomplished, still the news of its commercial prospects are so favourable that exporters cannot be too strongly recommended to pay attention to these Islands. During the period from July, 1900, to March, 1901, the imports have risen 52 and the exports 34 per cent. as compared with the previous year, and it cannot be denied that the American Administration

have had great success in improving the trade. It is of importance for exporters which system of duties the Americans will adopt, and whether American goods will have a preferential tariff—Spain had arranged formerly for such a preferential tariff—America has not adopted one at present, but whether it will ultimately do so remains to be seen. It is, however, important to note that the proposed scale of tariffs submitted by the commission in Manila and approved of by the War Department in Washington has retained the same scale of duties for American and foreign lands.

Trade Openings in Siberia.—The Canadian Pacific Railway recently sent a representative to make a complete tour over the Siberian Railway in order to investigate the possibilities which the country affords for the development of business, particularly in relation to manufactured goods. Mr. Whyte, who was chosen for the task, shows in his report that opportunities for trade are restricted considerably by the prohibitory import duties. Agricultural implements, however, find a ready sale. In fact, the Russian Government is itself introducing them in certain sections which, having been long settled, exhibit an adherence to primitive methods of agriculture. Axes and other cutting tools have a large market. Electrical apparatus also finds a sale in Siberia. Another feature of Mr. Whyte's report which deserves attention is the section devoted to the question of Siberia's fuel supply. Although a heavily wooded country extends along nearly all the route traversed by the Siberian Railway, that country contains large deposits of coal, which are already mined extensively both by the Russian Government and by private enterprise. The Siberian railroad, notwithstanding the abundance of wood for fuel, is mainly operated with coal, which is described as being of excellent quality. It is also worth noting that immigration from European Russia to Siberia is being carried on with considerable energy by the Russian Government. Its agents go about among the more thickly populated regions of Western Russia, make up parties of emigrants and dispatch them eastward along the railroad, where they are received by other Government agents and placed upon the lands granted to them. The Government allots a free grant of forty acres to each male emigrant, and sells supplies and implements on comparatively easy terms. In a Government publication, printed at St. Petersburg, it is stated that the Government expect to settle 5,000,000 people in Siberia during the next five years, and it is also claimed that by that time Siberia will export fully 30,000,000 bushels of wheat per annum.

Trade relations between Russia and America.—How evident it is that the present tariff war between Russia and the United States is only to be regarded as temporary, is shown by several opinions of the North American Press. They state that the future will show a more lasting basis than that with England. It is stated that the 640 kilometres of railway which, during the last ten years have been constructed annually in Siberia, have been made almost entirely with American materials. Rails, screws, waggons, etc., came from the United States, and principally from Pittsburg. The same applies to the East China line in Manchuria. At present passengers travel from Vladivostok to Chabarowsk, 763 kilometres, in Pullman cars from Chicago, and continued the journey by the Amoor and Schilka, by steamers, which are made at Pittsburg.

All along the Siberian railway numerous American posters are to be seen, advertisements of machine factories, etc. It is characteristic of the friendly feeling of Russia towards American exporters, that no advertisements besides Russian are allowed on the Siberian line. It is easily understood under these circumstances that this railway has carried in one lot 1,000,000 lb. of American machinery, and that from Pittsburg factories one million tons of railway materials were delivered in Russia during the year 1900. In the last few years two steamers have been despatched every week from Philadelphia and Baltimore loaded with American machinery for Russia.

In the meantime, however, North American journals complain that in Manchuria Russia is acting in an unfriendly manner, especially with regard to the imports of petroleum. The Russian Governor of Talienwan has forbidden the erection of warehouses for North American petroleum, with a view of rendering the importation of North American petroleum difficult in comparison with Russian.

United States.—COAL PRODUCTION IN PENNSYLVANIA.—The production of coal in Pennsylvania will, without doubt, be larger this year than ever, and is estimated as 10,000,000 tons higher than in 1900. The output in 1900 was 45,108,484 tons. In the first nine months of this year 40,309,786 tons have already been disposed of, against 34,202,710 in the same period of 1900. These figures represent the actual deliveries, and do not include the quantities used by the mines and coal companies. The demand is this year greater than ever; the production is quickly absorbed, and it is only in consequence of the want of transport that any stocks are left in the hands of coal companies.—*Handels Museum.*

United States.—EXPORT TRADE.—There are several "soft spots," says *Bradstreet's*, in the export trade of the United States which promise to still further accentuate the slight falling off already shown in the total volume of this branch of trade from a year ago. While the smaller takings of corn and cotton in themselves have been serious of late, the movement of these goods earlier in the year, and of wheat and wheat-flour all through the past summer and fall, were so large as to ensure a net gain in the export of agricultural products for the calendar year. In the exports of manufactured products, however, the same favourable report cannot be made, but when the reasons for this are examined into it is found that it is to the decline in the shipments of iron and steel and copper that the reduction in the exports of manufactures is due. For instance, the reduction in the aggregate exports of these two products is about \$46,500,000, about equally shared by iron and steel and copper, while the net reduction in exports of all manufactures is less than this, or only \$44,162,856. The export returns compiled by the Treasury Department Bureau of Statistics show that copper shipments for the ten months ending with October were 45 per cent. below those of 1900, and the value of iron and steel shipments is 21 per cent. less than last year. In the case of iron and steel the reduction is partly due to reduced prices per unit of quantity, in part to a reduced demand abroad, and in part to forced sales at low rates in certain foreign countries. In copper the reduction is not due to reduced prices, the average value per pound of the copper exports of the ten months of this year, being the same as that of the corresponding months of last year, viz., 16½ cents per pound. The reduction in copper, therefore, is in quantity, the exportation of ingots, bars and plates falling from 300,160,141 pounds in the ten months of 1900 to 162,728,397 pounds in the corresponding months of 1901. This falling off in the case of copper is due in part to a reduced demand in the European countries which were the chief foreign market for American copper, and in part to an increased production in other countries and reduction of prices by foreign producers. The only other important article showing a material reduction is mineral oil, which is about \$3,000,000 less than in the corresponding months of last year; but this decrease is solely due to reduced prices, the number of gallons exported in the ten months ending with October being 60,289,023 greater than for the corresponding months of the preceding year.

LABOUR MARKET. UNITED KINGDOM.

General Statistics.—The *Labour Gazette* reported that during November there was a decline in the engineering, ship-building and building trades. But, apart from this and the usual seasonal improvement in the printing trades, there were no marked changes in the state of employment compared with the previous month. On the whole, it is worse than during November, 1900, but considerably better than the average state of employment in November during the past ten years. In the 142 Trade Unions, with an aggregate membership of 545,832, making returns, 20,614 (or 3·8 per cent.) were reported as unemployed at the end of November, as compared with 3·7 per cent. in October, and with 3·2 per cent. in the 138 unions, with a membership of 539,175, from which returns were received for November, 1900. The average percentage of unemployed returned at the end of November, during the ten years 1891-1900, was 4·6. Twenty-five fresh

TRADE DISPUTES

began in November, 1901, involving 6,809 workpeople, of whom 4,924 were directly and 1,885 indirectly affected. The corresponding number of disputes in October was 26, involving 10,501 workpeople, and in November, 1900, 48, involving 18,099 workpeople. Of the 25 disputes in November, 1901, 8 occurred in the mining and quarrying industries, 9 in the metal, engineering, and shipbuilding trades, 3 in the textile trades, and 5 in other industries. Of the 25 new and old disputes, involving 6,500 workpeople, of which the definite result is reported, 7, involving 1,556 persons, were decided in favour of the workpeople; 11, involving 3,182 persons, in favour of the employers; and 7, involving 1,762 persons, were compromised. The changes in

RATES OF WAGES

reported during November affected 257,961 workpeople, and the net effect of all the changes was a decrease averaging 7½d. weekly per head. Of the total number, 10,500 received advances, and 247,461 sustained decreases. The changes of the previous month affected 17,684 workpeople, the net result being a slight rise, and during November, 1900, the number affected was 148,774, and the net weekly result was an advance of 4½d. per head. The principal decreases of the month were those sustained by 242,500 coal-miners in Durham and South Wales. Three changes affecting 109,032 workpeople were settled by Conciliation Boards, and three affecting 136,370 workpeople took effect under sliding scales. Changes affecting 1,133 workpeople only were preceded by disputes causing stoppage of work, and the remainder, affecting 11,458 workpeople, were arranged directly between employers and workpeople, or their representatives. During November the six Bureaux furnishing returns registered 1,597 fresh applications for work, as compared with 1,666 in November, 1900, a decrease of 69. Work was found by these bureaux for 813 persons, of whom 607 (454 males and 153 females), were engaged by private employers, 11 by Local Authorities, and 195 by the Salvation Army. The number engaged by private employers in November, 1900, was 682. The total number of workpeople reported as killed by

ACCIDENTS

during November was 424, or 57 more than in October, and also 57 more than in November, 1900.

COLONIES.

THE EMIGRANTS' INFORMATION OFFICE reports as follows:—**Canada.**—The report of the Canadian Department of Labour for November states: "The labour market generally continues in a healthy condition, full employment being the rule, and in many cases employers finding difficulty in securing sufficient labour. Partial exceptions exist in some districts where outdoor work—both of a public and quasi-public character, and building operations generally—shows a disposition to dulness, which, however, is quite usual at this season of the year. On the other hand, a good fall and winter trade has caused unusual activity in a number of trades which suffer from dulness during the summer." There is, however, at the present time no demand for more labour.

Australasia (New South Wales).—Disputes have arisen at the large Broken Hill silver mines on the working of the contract system. Under this system experienced men can make up to 15s. or even 17s. 6d. per shift of eight hours, but others complain that they can only make 2s. to 4s.; the average wages for a recent fortnight were 11s. 1d. per shift. There are also complaints of the inability to procure employment. In Sydney wages in many trades, especially the building trades, have risen, but wage-earners complain that the cost of living, owing to the proposed new tariff, has increased in greater proportion. Some of the branches of the boot trade, tailloresses, shearers, and glass bottle makers have been very unsettled, and are agitating for higher wages owing to the increased cost of living. The building trade is now less active, but all other trades continue to be fairly well employed, and there is some opening for general mechanics, plumbers, joiners, carpenters, and good labourers. **(New Zealand).**—There is no demand for more mechanics at Wellington. The building trades are busy in many places, but at Dunedin "they are very quiet," and at Christchurch "there are more unemployed carpenters just now than for years past." The engineering trade is only fairly busy, and at Dunedin some men are out of work. The boot and clothing trades are good generally, except at Dunedin, but there is no special demand for more hands. In several districts there is a demand for men able to milk, but otherwise the supply of unskilled labour has been quite sufficient. **(Queensland).**—There is a demand for farm labourers and ploughmen, but the supply of mechanics is for the most part sufficient. **(Victoria).**—There is stated to be a good demand at Melbourne for skilled shipwrights; the wages offered are 12s. a day and 2s. 3d. an hour overtime, but employment is not constant. In country districts farmers are suffering from the great difficulty of procuring competent farm hands and milkers, who prefer the higher minimum wage of 7s. a day and the shorter hours of work which the Government offers them in the towns. **(Western Australia).**—There is a demand for mechanics in one or two places only; there is no demand for miners anywhere; there is a good demand for agricultural labourers and for female servants.

South Africa.—In consequence of the establishment of Martial Law at all South African ports, it has been decided, with the concurrence of the Governments of the Cape Colony and Natal, that permits will be required by every person proceeding on and after the 1st January, 1902, to Cape Colony or Natal, to enable him (or her) to enter those colonies, and no person unprovided with such permit will be allowed by the authorities in South Africa to land in that country, except under special circumstances. Application must be made in person at the Permit Office, 39, Victoria-street, S.W., between the hours of 11 a.m. and 5 p.m., and should be made at least three weeks before the date of sailing. Permits will be issued with as little delay as possible, but the office cannot guarantee their issue within a period of less than three weeks from the date of application. Each applicant will be required to produce a certificate, signed by the Agent-General for the Cape Colony or Natal, a

member of Parliament, justice of peace, banker, parish priest or minister, or officer of H.M. Forces, to the effect that he is in possession of at least £100, or is in a position to maintain himself on arrival in South Africa, that the object of his journey is *bonâ fide*, and that he has not been deported or sent out of that country as indigent. Subjects of foreign Powers who may wish to proceed to South Africa from ports in the United Kingdom can obtain a permit on production of satisfactory evidence to the same effect from their respective embassies or legations in London. Passengers from ports not in the United Kingdom must supply themselves with permits from the Colonial Secretary or some officer appointed by the Colonial Government in the case of colonial ports, or from the British Consular Officer at a foreign port of embarkation, who will satisfy himself, as far as possible, that the applicants fulfil the above conditions. Members of a family proceeding to South Africa will be shown on the permit issued to its head, provided that a separate permit will be required for each son or daughter over 16 years of age. In view of the inconvenience and expense which a personal application for a permit to land in South Africa would entail in cases where applicants live at a considerable distance from London, persons living more than 50 miles from the metropolis may apply in writing to the South African Permit Office, 39, Victoria-street, when they will be informed of the conditions under which permits will be issued to them. Such applicants are, however, recommended to apply in person, if possible, especially in cases where the permit is required at an early date. It should be clearly understood that these permits are available only to enable passengers to land in South Africa, and are no guarantee that they will be allowed to proceed inland. Those who wish to do so must apply for permits at the port of disembarkation. The latter are warned that there are still thousands of persons waiting at the coast ports for an opportunity to return to their homes, who will probably have precedence over later arrivals.

EMIGRATION AND IMMIGRATION.

* * *The Imperial Institute acts in concert with the Emigrants' Information Office (which is under the direction of the Colonial Office), of 31, Broadway, Westminster, S.W.; and also with the British Women's Emigration Association, now temporarily carrying on its work in rooms at the Institute. The Handbooks and Quarterly Circulars issued by the Emigrants' Information Office may be obtained at the Commercial Intelligence Office. Special information and practical advice respecting Canada and Cape Colony will also be furnished by the Curators of these Sections.*

UNITED KINGDOM.

General Emigration.—The official parliamentary return of the numbers, nationalities and destinations of the passengers that left the United Kingdom for places out of Europe, during the month ended 30th November, 1901, shows that 20,675 emigrants sailed, as compared with 19,856 in November, 1900. Emigration to South Africa increased to 3,611 as against 2,889 in November, 1900; but to Canada and Australasia there were decreases of about 300 and 400 respectively. During eleven months of 1901, 290,325 emigrants sailed from our ports, or 3,168 more than in the first eleven months of the previous year.

Alien Immigration.—From the monthly return it appears that the total number of aliens that arrived from the Continent during November was 10,094, against 10,053 in 1900. Of this total, 5,483 represented the number of aliens not stated to be *en route* to America or other places out of the United Kingdom, and 4,611 represented the number *en route*. Of the total arrivals, 2,107 came from Germany, 1,120 from Holland, and 491 from Scandinavian ports.

British Women's Emigration Association.—The hon. secretary of the British Women's Emigration Association at the beginning of a new year reports the total number of applications received at the Emigration Office of this Association at the Imperial Institute in the twelve months, 3,851. From November 21 to December 21 there were 455 applicants, and the Association arranged for the passage of 34 persons, 31 of whom went to relations or to situations in South Africa.

The Home at Westminster, in which the emigrants have been able to lodge for the last six years, having been closed at the end of the year, it has become necessary for a Hostel to be established for the accommodation of the women who are obliged to sleep in London the night before they sail.

It is most necessary to have a safe and comfortable place where the parties can assemble, and where those waiting to embark can lodge economically. Each colony has its Receiving House, and such a Home in London would be available for emigrants to every colony. The Association possesses the furniture and fittings for 50 beds, and, until a house can be rented, is having to pay for the storage of these goods, as well as for rooms temporarily in another Home kindly offered for a time, in which our travellers can be received.

The very week the former Home was closed several young women from the country had to sleep the night in London before starting for Africa.

The Association makes a particular point of the proper protection of its travellers from the time they leave their homes until they are safely handed over to their friends or employers in the colonies, and that protection is as necessary while they are in London as anywhere else. Many of them are very grateful for this kind welcome and the rest, the night before leaving old England, and the Committee of the Association, feeling the great importance of this part of the work, has decided to take a house for this purpose as soon as possible.

The position and amount of room must depend upon the help given towards this special object, and the promise of future subscription towards its support. Respectable women can obtain temporary lodging in the Hostel at any time the rooms are not needed for emigrants, and their payments will help to make it answer. There is undoubtedly a great need for more temporary homes for women in London. The existing homes for working girls and other places of the kind are quickly occupied by young women in business, so that those out of employment or without a home of their own are often in difficulties where to find a decent shelter at a moderate cost. A well-managed house, with 25 to 50 beds, with two rates of payment, according to the sleeping arrangements, ought to be a success. Why should not someone, ready to spend money if only sure of its benefiting the colonies and the Empire, start this hostel in London for the British Women's Emigration Association?

A hostel for working men in Bethnal Green was opened in December, to receive 76 men at 6d. a night, with living and recreation rooms, and to found this an anonymous donor gave £2,250. The two-fifty, without the thousands, would found an Imperial Hostel for women emigrating, and it would be a centre for most useful work, in testing the fitness of applicants, and training those who required some probation or previous supervision. The medical inspections, the outfitting, the final instructions, the introductions, the farewell words, and the last letters home, would all find place under its roof.

Another development to which attention must be called is the monthly magazine, *The Imperial Colonist*, which is to be issued with the new year by the B. W. E. A. and the South African Expansion Committee, price 2d. a month, or 2s. 6d. a year, post free. It will be a means of communication between emigration workers, and their correspondents in all parts of the Empire, giving information about openings for the employment of women, and the arrangements by which they can avail themselves of them. Copies of *The Imperial Colonist* can be obtained at this office.

CUSTOMS TARIFFS.

UNITED KINGDOM.

Import Duties on Articles containing Sugar.—With regard to the rates of duty leviable on articles containing sugar, the Board of Trade have received a further amended Schedule of the fixed rates of duty on such articles, which has been issued by the Commissioners of Customs for the guidance of Customs officers. It appears from this document that the following additions require to be made to the Schedules already published:—

Confectionery, licorice—if declared by the importer	s. d.
not to contain more than 30 per cent. of added sugar or other sweetening matter—subject to occasional sampling and test	
Milk, condensed, slightly sweetened, whether whole, separated, or skimmed—if declared by the importer not to contain more than 18 per cent. of added sugar—subject to occasional sampling and test	1 3 0 9

COLONIES.

British North Borneo.—NEW CUSTOMS TARIFF.—The Board of Trade have received, through the Foreign Office, a copy of the *British North Borneo Official Gazette*, dated 14th October last, containing a copy of a Notification (No. 188), providing for the imposition of new rates of Customs duties on articles imported into, and exported from, the State of North Borneo, as from 15th October, 1901. The new tariff, in which the rates of duty vary considerably from those hitherto in force, may be seen by persons interested on application to the Commercial Intelligence Branch of the Board of Trade, 50, Parliament-street, S.W., any day between the hours of 10 a.m. and 5 p.m.

Mauritius.—PROHIBITION OF THE IMPORTATION OF CERTAIN ARTICLES FROM THE EAST COAST OF MADAGASCAR.—The Board of Trade have received a copy of a Proclamation (No. 56 of 1901), dated 17th October, 1901, revoking a previous Proclamation (No. 51 of 1901). The New Proclamation prohibits, in consequence of the existence of cattle plague, the importation from the East Coast of Madagascar, extending from Mahela to Fort Dauphin, of similar articles to those specified in the Proclamation published in the *Board of Trade Journal* for 26th September last, the chief of these articles being animals living or dead, also animals' produce and manures, as well as plants and agricultural produce generally.

FOREIGN COUNTRIES.

France.—CUSTOMS DECISIONS.—The Board of Trade have received copies of certain Circulars recently issued by the French Customs Department for the guidance of their officers, containing the following Decisions affecting the application of the French Customs Tariff:—

Allowance to sugars of French Colonies during the season 1901-1902, "for waste in manufacture."—Under the provisions of Article 2, Section 1, of the Law of the 13th July, 1886, sugars of French Colonies shipped to France are entitled to an allowance for waste in manufacture equivalent to the average excess-yield obtained by the home sugar industry in the preceding season. This average excess-yield having been equal to 28·97 per cent. in the season 1900-1901, French Colonial sugars imported into France during the season from the 1st September, 1901, to the 31st August, 1902, will receive an allowance for waste of 28·97 per cent.

AERATED WATER SYPHONS.—Vessels or syphons for aerated waters of glass or crystal, neither cut, engraved or ornamented, which have hitherto been classified as "bottles," are in future to be dutiable as "table-glass, plain and moulded," under No. 350 of the Tariff, at the rate of 4 francs per 100 kilograms gross (1s. 7½d. per cwt. gross).

France (Tunis).—IMPORTS OF TUNISIAN OLIVE OIL INTO FRANCE.—The *French Journal Officiel*, for the 30th November, contains the text of a Decree fixing at 20,000,000 kilograms the amount of olive oil of Tunisian production which may be imported into France free of duty during the 12 months ending the 30th November, 1902.

Germany.—CUSTOMS DECISIONS.—The Board of Trade have received translations of certain Orders, recently issued by the Hamburg Customs Authorities, affecting the classification for Tariff purposes of certain articles imported into the German Customs Union. The following is the substance of these Orders:—

Table-tops and oil trays for sewing-machine stands, even when imported separately from the machines, are to be treated as parts of sewing-machines (if recognisable as such), and are to pay duty under No. 15b (2) of the Tariff, according to the material of which made.

Bird-skins.—Skins of swans, herons, and divers (grebes), imported from the Argentine Republic under the designation of "raw skins of wild game," are to be admitted free of duty, under No. 12b of the tariff, as "birds-skins intended to be tanned," even although they may be dried and prepared to protect them against putrefaction and moths.

Cocobolo wood of the quality usually imported into Hamburg is to pay duty as "round wood in blocks (hard), not specially enumerated," under No. 13c (1) of the tariff, at the rate of 20 pfennigs per 100 kilograms. (= 2s. 0½d. per ton), or 1 mark 20 pfennigs per cubic metre (= 11d. per cubic yard).

Advertising cards of about the same size as post-cards, having a coloured picture and a trade mark on the front and advertising matter (with no space for written additions) on the back, are to pay duty as "printed paper cards, ready for use," under No. 27f (2) of the Tariff, at the rate of 12 marks per 100 kilograms. (6s. 1d. per cwt.)

CHANGES IN THE DRAFT OF PROPOSED TARIFF.—With reference to the proposed new German Customs Tariff (Part I.) the *Reichs Anzeiger* of the 14th November publishes a list of articles in respect of which certain alterations in the rates of duty originally proposed by the draft Tariff Bill have now been made. The following schedule shows proposed new rates:—

Tariff No.	Proposed Classification.	Rates of Duty.	
		Originally Proposed.	Now Proposed.
	The following duties have been <i>raised</i> —	Marks.	Marks.
452	Unbleached cotton tissues having 35 threads or less in a square of 5 mm.	100 kilogs. 50	100 kilogs. 60
489	Bleached linen handkerchiefs having more than 120 threads in a square of 2 cm.	" 140	" 145
	The following duties have been <i>reduced</i> —		
164	Linseed oil	" 6	" 4
164	Sesame oil, if rendered unfit for consumption	" 10	" 5
267	Phosphorus, red (amorphous)	" 20	" 10
	Phosphorus, yellow	" 15	" 5
381	Tanning extracts, not otherwise mentioned—		
	Liquid	" 8	" 2
	Solid	" 8	" 4
451	Dressed cotton tulle, not figured, if for embroidery, by special permission and under control	" 250	" 80
488	Unbleached linen handkerchiefs, having more than 120 threads in a square of 2 cm.	" 110	" 105
572	India-rubber threads, drawn or cut:		
	Not combined with textile materials	" 40	" 10
	Combined only with vegetable or animal textile materials loosely wound round or plaited thereon	" 40	" 20
	Wound round with silk or with yarn in which silk is contained	" 75	" 60
	Do. do. with other textile material	" 60	" 40
757	Microscopes	" 120	" 60
829	Rough chains for towing tugs	" 6	" 3
874	Copper printing-cylinders	" 30	" 18
875	Wire gauze of all kinds for industrial purposes	" 40	" 30
475	Cocoa-nut fibre drawn out into strands or spun of one or more threads, unbleached.	—	Free.
	<i>Note.</i> —Previously the exemption applied only to single unbleached yarn imported for industrial purposes and under permit.		
	The following alterations are further noted—		
275	<i>Acetic acid.</i> —The line of demarcation in weight between the two rates of duty is raised from 5 to 20 kilogs.		
438	<i>Unbleached single cotton yarn.</i> —The classification by numbers has been revised as follows:—		
	Up to No. 17 English	100 kilogs. 9	100 kilogs. 9
	Above No. 17 and up to No. 25 English	" 15	" 15
	Above No. 25 and up to No. 30 English	" 15	" 18
	Above No. 30 and up to No. 45 English	" 18	" 18
	Above No. 45 and up to No. 60 English	" 24	" 24
	Above No. 60 and up to No. 79 English	" 30	" 30
	Above No. 79 and up to No. 100 English	" 36	" 36
	Above No. 100 English	" 36	" 42
503	<i>Tracing cloth</i>	New Article	" 135
556	<i>Boots and shoes</i> of leather, with soles made of other material than wood. The schedule has been revised as follows:—		
	Weighing more than 1,200 grammes, per pair	100 kilogs. 85	" 85
	Weighing more than 1,100 and up to 1,200 grammes, per pair	" 85	" 120
	Weighing more than 600 and up to 1,000 grammes, per pair	" 120	" 120
	Weighing 600 grammes or less, per pair	" 120	" 180
786 to 788	<i>Iron or steel sheets</i> , of a thickness of 0.5 mm. or less, are now to pay the same rates of duty, under their respective Nos., as those between 0.5 and 1 mm. in thickness.		
925	<i>Vessels</i> of all kinds, imported to be broken up, are now to be free of duty, whether principally made of common metals or not.		

Russia.—RUMOURED PROJECTED REDUCTION OR REMISSION OF CUSTOMS DUTIES.—The British Commercial Agent in Russia reports that it is stated in the *Russkii Vedomosti* of Moscow of 3rd/16th November, 1901, that, according to rumours circulating in business circles at St. Petersburg, from next year the Customs duties on many articles of first necessity, as, for instance, iron, coal, machinery and implements imported from abroad, will be in part reduced and in part entirely rescinded.

Spain.—PAYMENT OF IMPORT DUTIES ON CERTAIN ARTICLES IN GOLD.—The Board of Trade have received a copy of a telegram from H.M. Ambassador at Madrid, stating that a Bill has been introduced into the Cortes by the Spanish Government, providing for the payment in gold of the import and export duties on certain articles. It is added that a Decree has been issued giving immediate application to the provisions contained in the Bill. The following are the articles on which, in accordance with the Bill and Decree, duties must now be paid in gold:—

Coal and coke; petroleum and mineral oils; oleonaphtha, vaseline, mineral lubricating oils, and mixtures of these products with animal or vegetable oils or fats; benzine, gasoline, and similar products; cod and stockfish; fish powder; wheat and wheat flour; cocoa and coffee from all countries, prepared or not; tea, yerba mate, cinnamon, and pepper, cloves, and other spices.

The duties on these articles are, however, to be subject to the following reductions dependent on the average rate of exchange, when above par:—

If 40 per cent. or more above par, a reduction of 30 per cent.
 " 30 to 40 per cent. " " " " 25 "
 " 20 " 30 " " " " " 20 "
 " 10 " 20 " " " " " 10 "

One of the provisions of the bill is to the following effect:—
 "By the average rate of exchange will be understood the profit on bill on sight from Madrid on Paris, according to the *Official Bulletin* of prices of the Madrid Bourse, in the month previous to that in which the payment of duties . . . takes place. On the last day of each month the Minister of Finance will fix the rate of exchange at which reductions in the payment of duties for the following month will be carried out, and this rate will be published in the *Madrid Gazette*.

According to a further despatch the Minister of Finance has fixed the rate of exchange for the month of December at 42.38 per cent., this having been the average rate during the month of November.

United States of America.—CUSTOMS DECISIONS.—The following is a list of some decisions affecting the application of the Customs Tariff and Customs Regulations of the United States which have recently been published by the Treasury Department at Washington, for the guidance of United States Customs Officers and others:—

Carbons for electric lighting.—Round sticks of carbon, one-half to five-eighths of an inch in diameter, and from 12½ to 20 inches in length, being ultimately intended for, and exclusively used in, electric lighting, are dutiable as carbons for electric lighting under para. 98 of the Tariff, at the rate of 90 cents per hundred.

Herbs in alcohol.—Herbs in alcohol, being articles manufactured by uniting or combining two elements or ingredients, are essentially compounds, and, as they contain alcohol, are dutiable at the rate of 60 cents. per lb. and 45 per cent. *ad val.*, under para. 2 of the Tariff. *Alcoholic extracts of herbs* are dutiable at the same rate.

Gloves.—Gloves made in chief value of cotton, and having a rubber braid or band at the wrist, are dutiable as cotton wearing apparel, under para. 314 of the Tariff, at the rate of 50 per cent. *ad val.*

Cotton cloths.—Fancifully-woven cotton cloths having open work stripes and other figures similar in some respects to net or netting, and bearing in certain proportions some resemblance to lace, are not dutiable as lace or lace goods (imitation or real), but are dutiable under the "countable para." of the Tariff (Nos. 304-310), with the additional duty of 2 per cent. per square yard provided in para. 313.

Prepared vegetables.—Vegetables cut open and washed and dried in the sun are dutiable as prepared vegetables, under para. 241 of the Tariff, at the rate of 40 per cent. *ad val.*

Carbonate of baryta, precipitated.—The exemption of carbonate of baryta from duty, under para. 489 of the Tariff, extends only to the natural mineral product known as "witherite." The artificial product, known as "carbonate of baryta, precipitated," is dutiable as a chemical salt or compound, under para. 3 of the Tariff, at the rate of 25 per cent. *ad val.*

Cotton tracing cloth.—Cotton tracing cloth, cut into sizes ready for use, is dutiable as "cotton cloth, filled or coated," under para. 311 of the Tariff, at the rate of 3 cents per square yard and 20 per cent. *ad val.*

Artificial wreaths.—Memorial wreaths of metal, or of metal and porcelain, painted to represent natural growths, are dutiable as artificial leaves and flowers, under para. 425 of the Tariff, at the rate of 50 per cent. *ad val.*

TRANSPORT AND FREIGHTS.

The Freight Market.—Outward rates have steadily declined, and current quotations are: Genoa 45. gd., Malta 3s. 9d., Port Said 45. gd., Las Palmas 6s., Buenos Ayres 10s. American markets are steady, but rates show very little improvement. **Australia** continues quiet. 23s. 9d. has been accepted for wool to U.K./Cont., and 25s. on d.w. to Cape ports. **Black Sea** market was active for prompt tonnage, but rates have again fallen away. **Eastern** markets have continued steady at 15s. Bombay, 22s. 6d. Calcutta, 21s. 3d. Rangoon. **Mediterranean** markets are steady at slightly improved rates. **River Plate** quiet at 16s. 6d. San Lorenzo limit.—WEDDEL, TURNER & Co., December 23, 1901.

UNITED KINGDOM.

The Clyde Shipbuilding Year.—The annual returns of the Clyde shipbuilding were issued on Saturday. They constitute a record for the river or any other shipbuilding centre. During the twelve months 296 vessels were launched, aggregating 530,000 tons, or nearly 40,000 tons more than in 1900, which was the previous highest year. Sixty thousand tons were represented by warships, five of the vessels being first-class cruisers. The sailing-vessels showed a marked decrease. The outlook for the ensuing year is not so encouraging.

Shipbuilding on the Wear.—The returns for 1901 of the thirteen shipbuilding firms on the Wear aggregate 270,329 tons Board of Trade measurement. This establishes a record for Sunderland, and an increase of 7,547 tons compared with last year's output. Messrs. Joseph L. Thompson and Sons, Limited, head the list with 39,137 tons.

Shipbuilding on the Tyne.—The shipbuilding returns for the river Tyne show that the total production of the yards has been 310,000 tons during the year just closing, only 5,919 tons short of the previous twelvemonth. The list is headed by Palmer's Shipbuilding and Iron Company, whose production has been 51,291 tons.

Service of Steamers between Harwich and Bruges.—As soon as the ship canal to Bruges is completed the Great Eastern Railway Company intends to start a service of steamers between Harwich and Bruges, the voyage to take not longer than four hours.

COLONIES.

Canadian Railways.—A NEW TRANSCONTINENTAL LINE.—In celebration of the driving of the last spike on the new line of the Canadian Northern Railway between Lake Superior and Winnipeg, Messrs. Mackenzie and Mann, the promoters of the system, were entertained at a banquet on the 30th ult. by the citizens of Port Arthur, Ontario. The road is now open for traffic for 1,500 miles, passing through Manitoba, and will be continued westwards to the Pacific Coast to form a new transcontinental line north of the Canadian Pacific, and traversing an exceedingly fertile prairie country.

Hong Kong.—SHIPPING.—Sir H. A. Blake, in his report upon Hong Kong, states that the tonnage of British ships entering the harbour of the colony during 1900 was 4,588,610 tons, and clearing 4,566,588 tons. The German shipping showed next with 959,173 tons entering and 958,571 clearing. Then follow in order vessels under the Japanese, French, Chinese, American, Norwegian, and Austrian flags. The tonnage of Chinese junks entering and clearing was 1,604,632 and 1,620,224 respectively; and of Chinese ships, other than junks, 136,765 and 138,507 respectively. The total of foreign ocean-going tonnage which entered and cleared was 2,425,086 and 2,425,311 respectively. The comparative shipping return for the years 1899 and 1900 shows, in the case of vessels under the British flag, an increase of 103 ships, measuring 430,182 tons; but there was a decrease in the river trade under the British flag of 111 vessels of 58,317 tons. This may be ascribed to the fact that certain British steamers engaged in the West River trade were sold. Many of the Chinese merchant steamers were transferred to the British flag, but the Scottish Oriental Steamship Company was transferred to the German flag, thus increasing German tonnage by 62,057 tons in arrivals, and 68,806 tons in departures.

Uganda Railway.—The laying of the rails of the Uganda railway has been completed to the Victoria Nyanza, the rail-head reaching the shore of the lake on December 19 last.

The West India Mail Service.—The directors of the Royal Mail Steam Packet Company have been in negotiation for a considerable period with the Government with a view to an enhanced speed in the West India mail service. At present the mails are landed at Plymouth once a fortnight, and are embarked at Southampton, the contract rate of speed being 13 knots. The steamship company has now offered a 14½-knot service from Plymouth to Barbados, which, by embarking the mails at the western port instead of Southampton, would give two days between the time of arrival at Plymouth and the next departure thence for replying to correspondence, the subsidy being £97,500 per annum for a five years' or £85,000 for a ten years' contract. The correspondence between the Government and the steamship company has been forwarded to the authorities of our West Indian possessions, who have been asked by Mr. Chamberlain to express their views on the matter.

INDIA.

Bombay and Delagoa Bay.—A regular steamship connection between Bombay and Delagoa Bay has been effected by the British India Steam Navigation Company. This Company's old line of boats running from Aden to Zanzibar now includes a monthly departure from Bombay via Zanzibar and Mombassa to Aden, and *vice-versa*, and connects at Zanzibar with the same Company's Zanzibar-Delagoa Bay line.

Karachi.—GRAVING DOCK.—A new graving dock for taking small craft was opened on November 1 last by the Karachi Port Trust, built to the designs and under the supervision of Mr. Edward Jackson, M.Inst.C.E., the port engineer, the work being carried out departmentally. It is entirely of Portland cement concrete, the entrance, hollow quoins, sill, dock floor, side walls, and coping all being formed of this material, in the proportion of seven shingle and sand to one Portland cement; the hollow quoins for the keel-posts of the gate being faced with concrete two to one for an average thickness of 15 inches. No stone masonry of any kind has been used in the work. The gates are of oak, copper-sheathed. The length over the blocks is 240 feet, at coping level 261 feet, width at bottom over blocks 43 feet, and at coping level 89 feet 6 inches; width of entrance 50 feet, depth on sill at high water ordinary spring tides 12 feet 9 inches. The cost of the temporary dam, dock gates, etc., exclusive of pumps, which were available, was £8,300.

FOREIGN COUNTRIES.

Germany.—THE NEW KÖNIGSBERG SEA CHANNEL.—With the recent inauguration of the channel across the Frische Haff to Königsberg, a work has been accomplished which promises to prove an immense advantage to that city. Hitherto large ocean vessels, for which there has been an abundant depth of water in the river Pregel, on which the city stands, have had to lighten at Pillau, because there was not depth enough of water in the Haff to permit of their getting into the river fully laden. This was not only inconvenient and costly, but caused much waste of time. Now, however, a remedy has been found. The principal advantage of the new fairway is, perhaps, the fact that it can more easily be kept free of ice than has hitherto been possible in the case of the two old channels—the Königsberger Rinne and the Pillauer Rinne. The cost has amounted to about fifteen million marks. The length of the channel from Pillau to the mouth of the Pregel is a little over twenty miles, and to this must be added about eight-and-a-quarter miles for the regularisation of the Pregel stream. The width of the channel between the dams is 87½ yards, and the breadth on the floor 32½ yards. In constructing the dams a double row of piles were driven in about 3 feet 6 inches apart, and the intervening space filled up with stones. Five sidings or passing places are provided in the channel, thus increasing the width of the bed at these spots by about 16 yards, and allowing the continuous progress of large steamers in both directions. The traffic will be controlled from Pillau, whence the keepers of the signal stations will receive their instructions by telephone as to the hoisting of the signals on the masts—balls by day and lights by night. The dues payable are: 1 pfennig per cubic metre per register ton net by vessels measuring up to 800 cubic metres, and another pfennig for every additional 200 cubic metres; the dues on cargoes are divided into three categories, namely, 15, 7½, and 5 pfennige per ton.—*Fairplay*.

Japan.—MERCANTILE MARINE.—Some statistics from Tokio just published show that the Japanese mercantile marine consisted in January, 1899, of 679 steamers, measuring 470,534 register tons, and 1,485 sailing vessels, measuring 165,710 register tons; in January, 1900, of 752 steamers (498,375 tons) and 2,783 sailers (270,161 tons); and on the 16th September, 1901, of 942 steamers (557,166 tons) and 3,416 sailers (315,767 tons).—After negotiating with the Russian Government, the Japanese Government has decided to establish in the coming spring a regular line of steamers between Tsuruga (Wakasa Bay, Nippon) and Vladivostok.

OFFICIAL AND COMMERCIAL CONTRACTS.

UNITED KINGDOM.

Blackburn.—The Corporation invite TENDERS, until the 18th inst., for the SUPPLY of MACHINE TOOLS required at their Tramway Depot, Intack. Particulars may be obtained from Alfred S. Giles, engineer and general manager, 9, Railway-road, Blackburn.

Kirkcaldy.—The Corporation invite TENDERS, until the 8th inst., for the SUPPLY, DELIVERY, and ERECTION of steam, exhaust, feed and drain pipes, feed pumps, feed heater, feed tank, tools, etc. Particulars (£3. 3s.) may be obtained from W. L. Macindoe, town-clerk, Kirkcaldy.

London.—The London County Council invite TENDERS, until the 28th inst., for the SUPPLY of TRACK RAILS, SLOTTED RAILS, CONDUCTOR TEE RAILS, with fish-plates, etc. Particulars (£2) may be obtained at County-hall, Spring-gardens, London, S.W.—(Barking).—TENDERS are invited, until the 24th inst., for the SUPPLY and ERECTION of additional GENERATING PLANT for the electricity works. Particulars (£1. 1s.) may be obtained from the engineer, Electricity Works, East-street, Barking.

Middlesbrough.—TENDERS are invited, until the 21st inst., for the SUPPLY and ERECTION of the following PLANT for the extension of the electricity works:—(a.) One 300 kw. high-speed STEAM DYNAMO and Accessories. (b.) SWITCH-BOARD PANELS. (c.) Condensing Apparatus and Pipe-work. (d.) Feed-Pump and Economiser. Particulars (£5. 5s.) may be obtained from Mr. Robert Hammond, 64, Victoria-street, Westminster.

Newcastle-on-Tyne.—The Tyne Improvement Commissioners invite TENDERS, until the 18th inst., for the CONSTRUCTION and DELIVERY at the Tyne of Four Single-screw STEEL HOPPER BARGES. Particulars (£3. 3s.) may be obtained from R. Urwin, secretary of the Tyne Improvement Commission, Berwick-street, Newcastle-on-Tyne.

Southampton.—The Director-General, Ordnance Survey, invites TENDERS, until the 13th inst., for the SUPPLY and ERECTION of FOUR HAND and POWER LITHOGRAPHIC PRINTING PRESSES, with four cast iron beds. Particulars may be obtained from the officer in charge of stores, Ordnance Survey Office, Southampton.

COLONIES.

Transvaal (Johannesburg).—TENDERS are invited, until the 31st inst., for the SUPPLY and DELIVERY of a complete CARRIAGE WATER GAS PLANT of a capacity of about 200,000 cubic feet daily. Particulars may be obtained from the Crown Agents for the Colonies, Downing-street, London, or from the town-clerk, Johannesburg.

INDIA.

Calcutta.—TENDERS are invited, until February 5, for the SUPPLY and DELIVERY, c.i.f. Calcutta, of 50 6-in. and 12 4-in. WASTE WATER METERS. Particulars were published in the *Engineer* of December 20 last.

South Indian Railway.—TENDERS are invited, until the 14th inst., for the SUPPLY of ROLLING STOCK, BRIDGE-WORK, Stores and Stationery. Particulars may be obtained at the office of Sir George B. Bruce, 3, Victoria-street, Westminster.

FOREIGN COUNTRIES.

Belgium.—TENDERS are invited, until the 28th inst., for the work of improving the Ghent canal at Terneuzen, between the bridge at Wondelgem and the Canardière bridge below Langerbrugge. The upset price of the work is £145,462. 5s. 2d., and a deposit of £7,200 is required. Particulars (2 frs. 60 cts.), may be obtained from the chief engineer, M. de Heem, Directeur des Ponts et Chaussées, rue d'Abraham No. 11, Gand; or from the engineer-in-charge, M. Grenier, Quai des Tonneliers No. 6, Gand (Ghent).—TENDERS are invited, until the 14th inst., by the National Company of Local Railways, 14 Rue de la Science, Brussels, for the CONSTRUCTION of the section of the LINE from Ath to Oudeghien on the railway from Ath to Fiobecq. The upset price is £6,688. 6s. 1d., and a deposit of £680 is required. Particulars (1 fr.) may be obtained at the Company's offices.

Norway.—TENDERS are invited by the Norwegian State Railways, until the 20th inst., for the SUPPLY of WATER-PIPES as follows:—200 metres 5-inch cast-iron socket-pipes, turned, bored, and dipped; 100 metres 4-inch cast-iron socket-pipes, turned, bored, and dipped; 1,700 metres 3-inch cast-iron socket-pipes, turned, bored, and dipped, besides irregular fittings, stop valves, taps, etc. Also for plumbers' work at four stations on the Ofoten Railway, to be done next summer. Particulars may be had from the head engineer's Office at Narvik. Besides Customs duties, the Norwegian Government give a preference of 15 per cent. to native tenders.—TENDERS are invited by the Norwegian State Railways, until the 8th inst., for the SUPPLY of RAILWAY POINTS. Particulars may be examined at the Commercial Department of the Foreign Office.

Spain.—TENDERS are invited by the Committee of the Port Works at Barcelona, until the 9th inst., for the SUPPLY of VEHICLES for the new commercial depot, and until March 10th, for the SUPPLY of a powerful STEAM TUG. Conditions and specifications can be seen at the office of the secretary to the Port Committee at Barcelona.—TENDERS are invited, until the 7th February, at the office of the Port Works at Huelva for the SUPPLY of METALLIC MATERIALS necessary for the execution of the works of the northern portion of the shipping wharves in the said port. Particulars are on view in the Secretariat of the Committee. A provisional deposit of 15,000 pesetas, or about £443, is required to qualify any tender. The contract may be estimated to be worth about £8,850.

COMMERCIAL LAW INTELLIGENCE.

Collision.—Loss of Mails.—Judgment was given in the Court of Appeal in the important appeal of the *Winkfield*—the SEAFIELD SHIPPING CO., LTD., v. UNION STEAMSHIP CO., LTD. (limitation of liability). The Master of the Rolls, in giving judgment, said this appeal was from an order of Sir F. Jeune dismissing a motion made on behalf of H.M. Postmaster-General in the case of the ss. *Winkfield*. The question arose out of a collision which occurred on April 5, 1900, between the ss. *Mexican* and the ss. *Winkfield*, which resulted in the loss of the former and a portion of her mails. The owners of the *Winkfield*, under a decree limiting their liability, paid a lump sum into court, and the claim in question was one by the Postmaster-General on behalf of himself and the Postmaster-Generals of Cape Colony and Natal to recover out of that sum the value of letters and parcels that had been registered and belonged to them in their capacity as bailees, and from first to last the case was argued on that footing. It was said in defence to the claim

that a bailee could not support an action unless he himself was liable to make good to the bailor the loss which had been occasioned by the wrongful act of the third party, and that as the Postmaster-General could not be sued, so neither could he sue in respect of these letters and parcels. But that was a wrong decision. In an action against a stranger for loss of goods occasioned by his negligence the bailee in possession could recover the value of the goods. The Postmaster-General was entitled to claim in the participation of the fund. The Lords Justices concurred, and the appeal was accordingly allowed, with costs.

Factory and Workshops Act.—In the King's Bench Division, before Mr. Justice Ridley and Mr. Justice Bigham, the case of the CONSOLIDATED PROPERTIES COMPANY v. CHILVERS was an appeal against a conviction obtained at the instance of the London County Council, for non-compliance with a notice to provide a fire-proof staircase. The London County Council required the Consolidated Properties Company, who carry on business at 112, Queen Victoria Street, to provide a new staircase from top to bottom under s. 7 of the Factory Act, 1891. The Consolidated Properties Company, Limited, however, could not comply with this order, because the ground floor and basement were let to other tenants who refused to allow the work to be done. The magistrate sitting at the Mansion House convicted the Consolidated Properties Company, and said that the question whether the order could be complied with ought to have been settled by arbitration under the section. The company appealed and afterwards went to arbitration, and a report was made by the arbitrators with which they were perfectly willing to comply. It was objected on the part of the London County Council that the conviction took place in March, 1900, and that it was not until February, 1901, that the company went to arbitration. The Divisional Court quashed the conviction, on the ground that it was for not complying with a notice with which it was impossible to comply.

Freight and Shortage.—In the King's Bench Division, the *WILHELMINA STEAMSHIP COMPANY, LIMITED*, sued Messrs. ARTHUR H. BRANDT & COMPANY for £99. 13s. 10d. balance of freight. Defendants admitted the claim, but counter-claimed for that amount of shortage. According to the bills of lading, 52,597 bags of sugar were shipped on the *Wilhelmina* (s.) at Vizagapatam for London, but on arrival in London there were, defendants stated, 199 bags short. Plaintiffs contended that they had delivered all the cargo that had been shipped. His Lordship (Mr. Justice Bigham) held that the bill of lading quantity had been received by the vessel so as to make the vessel responsible for the goods, and that the number of bags actually delivered out of the ship was the number which appeared on the return made by the Dock Company. He gave judgment for defendants.

The "Tied House" System.—A case involving an important question of law with regard to the tied house system has been disposed of in the House of Lords. The matter arose on an appeal in the action of NOAKES and COMPANY v. RICE from an order of the Court of Appeal affirming a judgment of Mr. Justice Cozens-Hardy. The appellants were a brewery company at Bermondsey, and were mortgagees of the King's Arms, Camberwell. The respondent, Mr. George Veasey Rice, acquired the public-house from them. By an indenture between the parties, the house was conveyed to the respondent for the residue of their term, the appellants advancing to him a certain sum for the purchase, which was secured by mortgage. There was a covenant that he should not sell malt liquors except such as were purchased from the appellant company. Six months afterwards the respondent gave the company notice to pay off all the moneys secured by the deed, provided the company were willing to release him from this covenant. They refused to acquiesce, and the respondent sought a declaration that on payment of all the moneys due he was entitled to have a reconveyance, and a release from the covenant in question and all the other covenants. Mr. Justice Cozens-Hardy, in giving judgment, said the mortgage was a security for the moneys covenanted to be paid, and that on payment the appellant company were bound to surrender and reconvey, and such surrender and reconveyance was inconsistent with the retention of an interest in the premises. He accordingly gave judgment for the respondent, and the Court of Appeal affirmed his decision. The company now appealed, contending that the covenant, which made the King's Arms a "tied house," as it is called, was valid in law, and precluded the respondent from the relief which he sought, and further that in equity he could not be relieved from a bargain into which he deliberately entered, and on the faith of which he obtained an advance from them which enabled him to purchase the premises. On the other hand the respondent said that to hold the covenant in force, after the mortgage was paid off, would be in direct contradiction to the terms of the proviso for redemption, and if regarded apart from the equity of redemption the covenant was unconscionable and oppressive, and therefore void. The Lord Chancellor, in giving judgment, said he was unable to come to any other conclusion than that the equity of redemption here was fettered by a condition which the policy of the law did not allow. He therefore moved that the appeal be dismissed with costs. The other noble and learned lords concurred. The appeal was accordingly dismissed.

BRITISH CONSULAR REPORTS.

France (Bordeaux).—COMPETITION BETWEEN AMERICAN AND BRITISH COAL AT BORDEAUX.—In a despatch to the Foreign Office, dated the 25th November, H.M. Consul at Bordeaux reports that the amount of coal imported into Bordeaux in 1900 was 850,000 tons, of which 840,000 came from the United Kingdom. Part of the balance of 10,000 tons came from the United States, but only as ballast in French steamers working regularly between Bordeaux and New York, which were not able to find other cargo to bring home.

This year, however, in addition to this ballast coal, of which 1,500 tons were brought in the last steamer, two cargoes have been brought over, one of 3,600 tons in a British steamer, and one of 5,000 tons in a Spanish steamer, while another 5,000 tons have been bought and are awaiting shipment.

The Consul also writes as follows:—"I am informed by experts, that there is very little to choose for steam purposes between the best American and the best Welsh coal, and that the demand for the one or the other will, in the future, when American coal has become better known, be a question of cost production and freights."

The cost of the coal, according to the Consul, is much lower in the United States than in the United Kingdom, but it appears to be only the excessively low freights at present prevailing on the other side of the Atlantic which allow of its being imported into Bordeaux. To obtain these low freights the coal appears to have to wait its chance.

The two cargoes mentioned above were shipped at 8s. 6d. and 9s. 6d. a ton as against 4s. from Cardiff.

The Consul further writes: "For the men to restrict output in order to keep up prices so that they may draw higher wages on the sliding scale, is to play directly into the hands of the

American coal trade and to allow it to get a grip of the market, which it will be careful not to lose.

"I believe, for gas-making purposes, American coals cannot at present, at any rate, enter the market against English gas coal."

Switzerland (Zurich).—THE SILK INDUSTRY.—In a report by the British Commercial Agent at Zurich on the silk industry of Switzerland, it is stated that the recent publication of the proposed revision of the German Customs Tariff, which has given a strong impetus to the discussion of tariff questions, has induced the *Zürcher Post*, one of the principal commercial journals published in Switzerland, to arrange for a series of articles to be written for that journal by experts in the most important branches of Swiss exports, as to the probable effect the proposed new German Tariff would have upon the Swiss export trade. The first of this series of articles, dealing with the silk industry, has recently appeared.

The value of silk exports from Switzerland in the year 1900 amounted to £8,959,000, or more than one-fourth of Switzerland's total exports in that year (£33,443,000). The writer of the article states: "If the Swiss silk exports were to be divided up amongst those countries with which we are compelled to negotiate commercial treaties, since the period of protective duties has visited the European continent, our position would indeed be a critical one. We ought, therefore, to consider ourselves fortunate that the chief portion of our products is sent to the only country in the whole of Europe—England—which has up to now held fast to free trade."

The importance of our silk trade with England is shown by the following figures, which give the percentage for the last five years of England's share in our total silk export industry:—

1896	42½ per cent.
1897	44 "
1898	42 "
1899	42½ "
1900	44½ "

"If England were to impose taxes on articles of luxury, such as silk, on fiscal grounds, and to cover the costs of the war, and if, for example, she were to fix a duty on silk on the same scale as the German duty, it would practically mean the closing of nearly all our silk factories. The English market is already a keen field of competition for our silk exports; the manufacturers of the whole world are competing against each other for the English trade, and it is especially the rapidly-increasing Japanese silk industry which makes the struggle so keen. The result of a duty being imposed on silk in England would inevitably be, that factories would be started in that country by home and foreign manufacturers, which would be able to compete successfully with their continental rivals. At the present moment the condition of things does not necessitate such a step."

"There is every ground for confidence that, as soon as the war in South Africa is at an end, and provided that the British Chancellor of the Exchequer does not lay his heavy hand upon silk imports, the deficit of silk imports in the year 1900 will soon be made up. Our exporters are building great hopes upon this period, as well as upon the change in the commercial policy of America, which has frequently been prophesied of late. An industry, 95 per cent. of the production of which is exported, and of which nearly one-half of the total exports go to one single market (Great Britain), a market which is year by year becoming more flooded, and which is so sensitive to every change in the fashions, cannot but look with anxiety into the future."

The writer of the article then deals with the silk exports to Germany, and gives the percentages for the last five years, namely:—

1896	8.6 per cent.
1897	8.2 "
1898	8.2 "
1899	7.2 "
1900	6.1 "

"The duty hitherto imposed on Swiss silk goods is 600 marks or 15 per cent. of the average value, which is sufficiently high to protect the German silk industry. In the new tariff proposals the duty (on piece silk goods) has been increased to 900 marks, or 22½ per cent. of the average value, but it is not thought that this increased rate will be adopted, as the Crefeld factories have during the last few years been fully occupied, and there is therefore no fear of the Swiss exports injuring the German industry."

"There are altogether 23 Swiss silk factories established in foreign countries, the mechanical weaving looms being distributed as follows: Germany, 3,652; France, 1,445; Italy, 1,408; America, 2,058. This 'emigration' may be regarded as a corrective against over-production in our own country; it is not without value for our country if Swiss firms go abroad in order to wage a battle with foreign competition, particularly as most of the Swiss establishments in other countries are only branches of the home factories, and not independent establishments. If it were necessary it would be possible to use these branches for the purpose of giving employment to Swiss workmen in the event of a crisis taking place at any time at home."

FOREIGN CONSULAR REPORTS.

Furs of the Upper Yukon.—Dawson is the central market for a vast fur-bearing country, stretching from the Mackenzie Basin to the coast range, and from the Porcupine to the Hootalinqua. In this area, perhaps, 1,000 men are engaged in hunting and trapping, exclusive of the Indians; and from Dawson fully 40,000 peltries are annually exported to the great fur markets of London and New York. The industry yields a revenue every year of nearly \$350,000. In the local markets London quotations govern. These are fixed twice a year—in March and August—by a board of principal dealers in that city, and prices are gauged according to that scale in all parts of the world except Russia. The present rates, compared with prices a year ago, show an increase on bear, beaver, otter and mink, and a decrease on silver-grey fox, marten, wolf and wolverine. On most other peltries quotations are the same. A wide difference is often noted between the maximum and the minimum figures; this is due to variations in the shade and quality of the fur, and to the time of the year in which the animal was caught. Local dealers say the pelts in the vicinity of Dawson City are of better quality and obtain higher prices than those taken along the Lower Yukon and on the Alaskan coast. The hair is softer and more glossy in appearance. In varieties, marten are the most numerous and black fox the scarcest. The latter is the most valuable of all, a good pelt readily bringing \$300; and muskrat is the least costly, being worth only 4 cents. The favourite rivers among the trappers are the Pelly, White, Stewart, and Porcupine, while game hunters prefer the Klondike and Forty Mile, because of their accessibility to a ready market. The Big and Little Salmon, Hootalinqua, Chandelar, and Selwyn rivers, are also frequented by many trappers, while a goodly band is scattered along the Yukon itself. The Peel and other streams flowing into the Mackenzie Basin are also considered choice trapping grounds. The annual production

of the different varieties of pelts, their market value, and special facts distinguishing their distribution, are given as follows:—

Beaver.—Black, silver tip, brown, grizzly, and cinnamon; found all over the country from March to November; number shipped, 3,000; price, \$10 to \$25. It takes an exceptionally fine skin to bring more than the maximum figure quoted.

Beaver.—On all streams, but chiefly numerous on White, Pelly and Stewart rivers; number shipped, 2,500; price, \$3.50 to \$7.

Mink.—On all streams; number shipped, 1,500; price, \$1.50 to \$3.

Marlen.—On all streams; number shipped, 25,000 to 30,000; price, \$3.50 to \$12.

Otter.—On Pelly and along the Yukon, most of the pelts coming from below Dawson; number shipped, 200; price, \$4 to \$8.

Foxes.—Red: number shipped, 2,000; price, \$1.25 to \$2.50. Cross: number shipped, 650; price, \$3 to \$10. Silver gray: number shipped, 25 to 40; price, \$100 to \$200. Black: number shipped, 5 to 7; price, \$200 to \$300.

Lynx.—Mostly from along the Dalton trail; number shipped, 2,000; price, \$1 to \$2.50.

Wolves.—Black and gray, mainly near the mountains; number shipped, 2,000; price, \$1 to \$2.50.—*United States Consular Report.*

New Fuel for Swedish Railways.—Sweden imports yearly large quantities of coal and coke, and this trade is increasing steadily, in pace with the industrial activity and the building of new railroads. Several millions of dollars are annually paid out to foreign countries for fuel. This has caused the authorities to consider whether Sweden could be made more independent in this respect. It has been suggested that the State railroads could get their motive power partly from waterfalls, and experiments will probably be made in this line. The managers of the State railroads have been instructed to make trials of peat charcoal and peat briquettes as fuel for locomotives. The intention is to construct a special locomotive to be used in these experiments, and if they are successful other engines will undoubtedly be built, because peat is abundant in this country. The navy and the State railroads have also tried to use Swedish coal, but without success; the efforts will be continued, however. A Gothenburg newspaper reports as follows:—

In the new briquette factory at Elmhult, belonging to the State, experiment will be made in the production of a cheap and practical fuel for Swedish railroads. In locomotive furnaces, Swedish coal cannot be used alone, because it contains too much scrap and incombustible substances, which are not consumed, but form offal and ashes. It must, therefore, be mixed with English coal, but this is becoming more and more expensive. The possibility of using Swedish coal alone is therefore ideal, and the above-mentioned factory has been built to be employed in the attempts to make or refine Swedish coal into a good fuel. The factory will operate according to a German patented method, and has been put up under the supervision of a German. It will be started this fall, and the work will continue night and day. It is calculated that the output will be 36 briquettes per minute—that is, 51,840 per 24 hours, or 15 cartloads of 10,000 kilograms per car. Experiments will first be made with 40 cartloads of Swedish coal of the lowest grade.—*United States Consular Report.*

Paper Trade in Japan.—According to an American consular report, the paper trade in Japan is already becoming more developed, and a good quantity is now being manufactured for export. Nevertheless, Japan imported in 1900 more than 20,000 tons of paper. The greater part of this came from Germany, which sent all descriptions with the exception of cigarette and printing paper. France sent most of the former and England the latter—some paper for newspaper printing came from America.

Plumbing and Sanitary Appliances at Nice.—Modern improvements are being introduced into buildings in this consular district, and the United States Consul is of the opinion that the use of sanitary appliances will assume large proportions in the next few years, and that manufacturers should seek to enter this field. The system of supplying hot water throughout houses has not yet been adopted here, but detached water-heaters are largely used. Considerable quantities of these goods have been imported from England; up to the present the sales of German firms have consisted principally of brass cocks and faucets and of plain zinc baths. Nickel-plated goods pay a very high duty, and non-detachable parts subject the entire article to the same duty. Manufacturers should, therefore, nickel only such parts as may be detached and weighed separately. The high prices charged up to the present for the most elementary sanitary appliances have been the cause of the limited consumption. Manufacturers of standard lines or of specialties should find a reliable agent to handle their goods and ship them direct, thus avoiding freight charges, middleman's profit, and commissions. Where possible, a certain credit should be given. In one case, a German firm gave a plumber one year's credit on a bill of brass cocks and toilet faucets. He now purchases all this kind of goods in Germany.

Soap and Substitutes for Soap in Syria.—The United States Consul points out that while toilet and shaving soaps are imported from abroad, the Syrian soap-manufacturing industry is by no means unimportant. This refers particularly to the Nablous, Haifa, and Tripoli soap factories. "Mount Carmel soap," manufactured by an American firm at Haifa, is in demand in the United States. Olive oil enters largely into the production of Syrian soap. Importers will find in Syria an article which is extensively used for washing woollen stuffs, as it does not shrink them, to wit, the soapwort (*Saponaria officinalis*) root, which takes the place of our wool soap, does the work equally well, and is incomparably cheaper. In the opinion of the United States Consul, it would pay to import this root. Pressed into bales, it would form a product which could be conveniently transported. Letters on this subject may be addressed to H. Sabbag and Fils, Beirut, Syria. The root is also successfully used in washing fresh and fast-coloured cotton fabrics, as it prevents their fading. The Arabic name for this useful root is "shursh-halawy." The Arabs of the interior use the desert shrubs "ushran," of the family of *Salsolaceae*, by burning them, and extracting the soda from the ashes. Indeed, the ash is almost pure soda. A solution of it is powerfully detergent. They also use lye, procured by lixiviating the ashes of wood and charcoal, for washing clothes. Sesame oil is commonly employed by Arabs for "cleaning" face and body, also for prickly heat, and other diseases of the skin.

Trading Firms in Japan.—The Austrian Consul at Yokohama reports that the number of European and American firms established in Japan is decreasing. At Yokohama in 1899 there were 303, while in 1900 there were only 248. The number of Japanese merchants in China and Korea is increasing. As soon as things in China return to their normal state it is expected that a large contingent of Japanese merchants will proceed thither and carry on a keen competition with foreigners. In Korea they have already made all competition impossible. The report points out that Japan is thus becoming more and more, particularly in the Asiatic Continent, an important commercial factor which ought not to be under-estimated.

CHAMBERS OF COMMERCE REPORTS.

UNITED KINGDOM.

Leeds.—The Council of this Chamber had under consideration at a meeting on the 26th November, certain suggestions for reforming the Parliamentary machine, so as to render it a more workable and efficient instrument. The present system, under which private bill legislation not only entails a great waste of time, but a large amount of cost to local authorities, came in for hearty condemnation all round. The President (Mr. G. R. Portway) moved this resolution:—That the Council take steps to obtain the views of the commercial community as represented by Chambers of Commerce throughout the country on the desirability of a re-arrangement of the conduct of business in Parliament, and the method of taking divisions so as to avoid the present waste of time. The extension of the system of the devolution of business to committees, especially the consideration of the estimates. Bills which have passed their second reading in one session being taken up in the same Parliament at the stage which they had reached in the preceding one; and enquiries into private bills being conducted locally before a Commissioner appointed by Parliament, and not before Committees of the Houses of Parliament, in a manner similar to that prescribed by the Act of 1899 with regard to Scotch Bills.

Mr. Portway pointed out that recent events had shown the present Administration to be desirous of reforming the conduct of public business in Parliament. At present they had a machine which could not do its work, chiefly because it was not adapted for what it had to do. One authority declared that during last session only one bill of any importance initiated by a private member was carried through. By passing some such resolution as he proposed the Chamber would strengthen the hands of Parliament in effecting a reform that was much needed by the whole commercial community. Too much time was now occupied in taking divisions, and too little spent in investigating the national expenditure. At present our expenditure was growing by leaps and bounds—not merely on account of the war, but the normal expenditure also. In a year or two he feared that we should be feeling, and feeling very heavily, the weight of taxation. Surely the country was entitled to ask that there should be some really efficient control exercised over the estimates of the country. The President dwelt on the costliness of private bills promoted in Parliament. It was estimated, he said, that £500,000 was spent every year on legislation of this kind, and of this sum the Leeds Corporation must spend a considerable amount each year.

Mr. John Ward said that, frequently, a local authority had to go before a Committee of Parliament who had not the least knowledge of the local circumstances of the case under consideration. He had known bills promoted by the Leeds Corporation that had involved at least a fortnight's time in London. The fees of counsel and witnesses were, in such circumstances, very great—especially if an unfortunate authority were called upon to pay the expenses of the opposition. It was expenditure that no local authority should be put to. Mr. H. Barron said that as to the proposal to appoint a Commissioner to enquire into local bills, he was not at all sure that that would be a wise plan. Chairmen of Committees of Parliament were, in any event, men of affairs and free from local prejudices. Alderman Wurtzburg agreed that the expense of getting private bills through Parliament was enormous. In a case that came under his own notice, concerning a light railway, the Commissioners who held the enquiry granted an order, but the Board of Trade, whom they represented, afterwards said it must come before Parliament. In such a case as that the expense to the promoters was doubly great. The resolution was unanimously passed.

On the motion of Mr. Zossenheim, the Council agreed to a resolution asking local Members of Parliament to support the compulsory adoption of the metric system in this country "within a reasonable time." The difficulties in the way of the change contemplated were pointed out, and a diversity of opinion expressed as to the number of years that should be allowed before the system became compulsory.

Manchester.—A meeting of the Board of Directors was held on the 11th ult., Mr. John Thompson, president, occupying the chair. A letter from the Birmingham Chamber of Commerce on the subject of the prejudicial effect upon British industry of the action of shipping conferences in maintaining differential freight rates to the disadvantage of exporters of British manufactures, was remitted to the Shipping Committee for consideration and report. The attention of the Chamber has recently been called to the policy of the French Colonial Office in granting trading concessions involving monopolies which, it is alleged, are not in conformity with the International Act of Berlin respecting Africa. On the 13th November a joint deputation, representing the Liverpool, London and Manchester Chambers, had an interview with Lord Lansdowne at the Foreign Office with special reference to the concessions in the French Congo. The proceedings were not made public, but the representative of the Manchester Chamber reported that satisfactory assurances had been given to the deputation that the action of the French authorities was under the careful consideration of the Foreign Office. The minutes of the India, China and Colonial Committee contained a reference to the recently completed official telegraphic vocabulary, which it was intended to make obligatory for the selection of words for use in international code telegrams. This matter, which has been the subject of much consideration and correspondence by the Chamber since the inception, several years ago, of the project of a compulsory vocabulary, is receiving the attention of other commercial bodies. Other matters under consideration were London-Paris afternoon train service; sub-basements in warehouses; Parliamentary procedure; contracts for exports to Delhi; and patent law reform.

Newport (Mon.).—At a recent meeting of this Chamber an address was delivered by Mr. Joseph Lawrence, M.P. for Monmouth District (Sheriff of London), upon the question of competition in steel-making. In the course of his address Mr. Lawrence called attention to statements made to him by Mr. Schwab, President of the United States Steel Trust, in reference to the cheap manufacturing cost in the United States. He referred also to the cheap transport of material in that country, instancing the cost of carriage from Pittsburg to New York, 450 miles, which was less than that from Liverpool to Birmingham, one-fourth of the distance. Mr. Lawrence said there was no doubt we would in time feel the effects of the American steel competition, and that we must be prepared for it. If the steel trade was to continue in this country, it must resort to cheaper ores and to carrying cheaply, and to do this that portion of the freight must be eliminated which consisted of carrying dirt as well as ore. It should be crushed at the mines and the ore extracted.

Walsall.—At a meeting of the Council of this Chamber, on the 25th November, Mr. F. Rathbone presided, and mentioned that details of the Australian Commonwealth tariff were being printed for the information of local traders. The particulars were very complicated, but, roughly speaking, the duties appeared to be about 20 to 25 per cent. against all comers, and it was hardly necessary to say that there was no preferential treatment of Great Britain. The members of the Chamber had no doubt seen a report of the speech by Mr. Hay before the New York

Chamber of Commerce, and he (the President) took it that many of the United States duties against this country would be reduced in some way. The President also reported that it had been found necessary to abandon the idea of having a Walsall section at the Wolverhampton exhibition, owing to so few local manufacturers showing any inclination to be exhibitors. The promoters of the exhibition had, however, been thanked for their offer. He (the President) thought he might say the Chamber did all it could in the matter, considering how late in the day it was approached. The President mentioned that the five scholarships offered by the Chamber in connection with the commercial course at the Science and Art Institute had all been awarded, and Mr. H. D. Clark stated that, although the number of students going through the full commercial course was not very large, it had to be borne in mind that it necessitated attendance at seven classes each week, and individual classes in office routine and French were more numerous attended this year than at any previous period. A report was read from Messrs. H. Bompas Smith and J. H. F. Grayson with regard to the commercial course at Queen Mary's School. This gave details of the work which had been done, and the opinion was expressed that the institution of the classes appeared to solve the problem of how to equip the business men of the future for their vocations. Mr. W. H. Brookes said the only addition he could suggest to the subjects taught was that the importance of being industrious should not be lost sight of. Mr. J. Scott expressed pleasure at the work being done, and said he believed unless parents would allow their boys to remain at school long enough to learn French, German, and Spanish, the town was bound to suffer, as many firms had been injured by having to place their interests abroad in the hands of foreigners.

The President said he understood the reference by Sir Walter Peace, Agent-General for Natal, to the question of the standardisation of metals had aroused a good deal of interest, and was of considerable importance to firms at Wednesbury, which was in the area of the Chamber. Mr. A. W. Hutton said the subject was one of great importance to iron and steel manufacturers, and one with regard to which matters were getting worse and worse, owing to the difficulty of meeting the specifications which were put before them. Engineers got hold of a lot of specifications, and picked out the worst possible test in every case, and put them all in one specification, so that not only did the mechanical test not agree with the chemical test, but they were incompatible with one another. As everyone knew, steel with a very high tensile strain would not elongate very much, but they expected the same elongation out of high tensile steel as out of low tensile steel, and the consequence must be that the tests could only be passed by means of some trickery. It must clearly be against the interests of the people who ordered the materials, and the manufacturer before whom these extreme tests were placed, that this state of things should exist. It was a question of great importance to many districts, and ought to be taken up in earnest. A letter was also read from Mr. W. E. Blyth on the same subject, in which he suggested that the Chamber should communicate with the Wolverhampton, Sheffield, Middlesbrough, and Birmingham Chambers, and see if some general course of action could be agreed upon with a view to the formulation of a scheme which could be brought before the Government. The President intimated that he proposed to convene a special meeting with regard to this subject, and he had promises of support from firms in the district who were interested. A letter was read from the National Telephone Company urging that it was unreasonable that they should be called upon to supply all subscribers with a complete directory when the greater portion of it was never used, and the opinion was expressed that their explanation removed most of the cause of complaint. Mr. J. A. Leckie proposed a resolution urging the establishment of a municipal telephone exchange for the town. The service they had was excessively charged for, and this no doubt accounted for the fact that there were only 202 subscribers in Walsall. This was one of the matters in which continental towns were far ahead of us, and, as an instance of this, could be cited Copenhagen, which with 312,000 inhabitants had 15,000 telephone subscribers. At the same ratio Walsall would have had 4,500 subscribers. The opinion having been expressed that the present time was inopportune for the Chamber to commit itself to this proposal, it was agreed that the resolution should merely express approval of the enquiries which were being made by the Town Council into the subject, and in this shape it was unanimously passed. It was announced that a set of harness for the model horse at the Science and Art Institute had been gratuitously manufactured by several local firms, to whom Mr. Clark expressed the indebtedness of the Technical Instruction Committee. He proposed a vote of thanks to all concerned, and Mr. Scott, in seconding this, said the quality of the harness was testimony to the ability of local firms to turn out goods of the highest class.

GENERAL INTELLIGENCE OF THE PAST MONTH.

December, 1901.

UNITED KINGDOM.

DEC. 1st: The Queen's Birthday was celebrated.
2nd: The King, accompanied by the Prince and Princess of Wales, left Sandringham for Marlborough House, where His Majesty received the new German Ambassador and the Ministers of Ecuador and Hayti. Death of the Earl of Sefton. Colonel Sir H. Smith resigned the Commissionership of the City Police. Mr. R. Kettle was appointed a Metropolitan Police Magistrate.

3rd: The Prince of Wales accepted the Presidentship of St. Bartholomew's Hospital. Lord Shaftesbury was appointed Chamberlain of the Prince of Wales's Household, and the Hon. A. N. Hood Private Secretary. The Queen Victoria Memorial Fund amounted to £182,000. Sir A. R. Scoble and Sir J. W. Bonser were appointed Members of the Judicial Committee of the Privy Council.

4th: The National Liberal Federation held a meeting at Derby. The annual meeting of the British South Africa Company was held. Death of Sir W. MacCormac.

5th: The King returned from Frogmore to London. The Prince and Princess of Wales visited the City, and were entertained by the Corporation at the Guildhall in celebration of their return from their colonial tour. Dr. Weldon, Bishop of Calcutta, was appointed Canon of Westminster.

6th: The Postmaster-General received a deputation from the Loudon County Council protesting against the terms of the new Post Office telephone scheme. Death of Sir Charles Legard.

7th: The Duke of Cambridge distributed prizes for shooting to the Middlesex Imperial Yeomanry. A petition was made against the appointment of Canon Gore to the Bishopric of Worcester.

8th: Death of Lady Grimthorpe.

9th: The King and the Prince of Wales visited the Smithfield Club Cattle Show. The Transvaal War Fund at the Mansion House amounted to over £1,130,000.

10th: The King signed a proclamation fixing June 26 next as the date of the Coronation. Mr. Cripps, K.C., M.P., was appointed Attorney-General to the Prince of Wales.

11th: The British Delegates to the Sugar Bounties Conference at Brussels were appointed. The Board of Trade decided that the continuous current system should be adopted by the Underground Railways.

12th: The Royal Agricultural Society held its half-yearly meeting, Prince Christian presiding. The Agricultural Education Committee held a meeting.

13th: Death of Admiral Sir George Eliot. The Poor Law Conference was concluded. Mr. R. A. Germaine was appointed Recorder of Lichfield.

14th: Major-General Baden Powell left Southampton for South Africa. A committee was appointed by the President of the Board of Trade, to report on the Light Railways Bill.

15th: Death of Sir James Laing.

16th: The King and Queen arrived at Marlborough House from Sandringham. Lord Rosebery addressed a great Liberal meeting at Chesterfield. The Rev. A. W. Upcott was elected Head Master of Christ's Hospital. Death of Sir Francis de Winton. Death of the Ven. David Lewis, Archdeacon of Caermarthen.

17th: The King held an investiture at St. James's Palace. The Crown Prince of Siam visited Manchester.

18th: At Castlebar, Mr. Conor O'Kelly, M.P., and four other members of the United Irish League were sentenced to imprisonment. Pro-Boer riots occurred at Birmingham. Death of Lady Ellis.

19th: Mr. Asquith addressed a Liberal meeting at Bilston. Lord Morpeth, Mr. M. Macdonald, and Mr. J. Sinclair, (Progressives) resigned their seats in the London County Council. Small-pox cases increased in London.

20th: Dr. W. Somerville was appointed Assistant Secretary of the Board of Agriculture. The Head Masters' Conference was opened at Birmingham.

21st: Lord Rosebery was presented with the freedom of the borough of Swansea. Mr. J. P. Hayden, M.P., and six others were convicted of unlawful assembly at Ballinlough, and sentenced to imprisonment.

23rd: Death of the Earl of Carrick. Death of Sir Henry Gilbert, in his 85th year. Death of Mr. Onslow Ford, R.A., sculptor. A serious accident occurred on the Liverpool (Overhead) Electric Railway.

24th: The Marquess Ito arrived in London. At Ballymote, Mr. Jasper Tully, M.P., Mr. J. O'Donnell, M.P., and three others, were sentenced to imprisonment for unlawful assembly.

26th: Major-General Sir E. T. H. Hutton left Folkestone for Australia. Dr. A. Smith Woodward, F.R.S., was appointed Keeper of the Department of Geology in the Natural History Museum. It was announced that the King would open Parliament in person on January 16. Smallpox and fever cases increased in number in London. Death of Sir Noel Paton.

27th: The King received the Marquis Ito at Marlborough House.

28th: A Royal Commission was appointed to enquire into the resources of the coalfields of the United Kingdom.

30th: The King and Queen, accompanied by Princess Victoria and the Duke and Duchess of Fife, left Marlborough House for Sandringham. It was stated that the Deanery of Chichester was offered to Archdeacon Mount. Death of Rear-Admiral F. W. Hallowes.

COLONIES.

Australia.—4th: The Pacific Islanders Bill was passed by the Senate.—6th: The Alien Immigration Restriction Bill was passed by the Senate.—13th: The Federal Parliament adjourned till January 14.—23rd: The offer of another Australian contingent of 1,000 men for South Africa was accepted. **New South Wales.**—6th: The Industrial Arbitration Bill was passed by the Legislative Council.—17th: The new Land Bill was passed by both houses. **Victoria.**—11th: Sir G. S. Clarke, the new Governor, arrived in Melbourne.—23rd: The Parliament was prorogued. **South Australia.**—5th: The Legislative Council amended the Constitution Bill, increasing the members of the Council from 18 to 21, and reducing members' salaries to £150, and also those of the ministers.—17th: The Parliament passed the Constitution Bill. **Queensland.**—14th: The Government requested that the Pacific Islanders' Bill should be held back, so that an appeal against it might be made. **Western Australia.**—7th: Mr. Morgan, the new Premier, Mr. Quinlan, Commissioner of Public Works, and Mr. Nanson, Minister of Lands, were re-elected, and Mr. Moss, Colonial Secretary, and Mr. Moorhead, Attorney-General, were defeated.—20th: The Ministry resigned.—23rd: A new Ministry was formed, with Mr. Leake as Premier and Attorney-General. Lord Hopetoun arrived in Perth.

New Zealand.—13th: Mr. Seddon offered to send 1,000 more men for service in South Africa.

British West Africa.—3rd: The expedition against the Aros tribes made a successful advance into the country and occupied posts.—29th: News was received that the Aro town of Arochuku had been captured.

Canada.—1st: The death of Baron Aylmer of Richmond was announced. The new contingent of 600 mounted rifles left Montreal for South Africa.

Cape Colony.—1st: It was announced that no person would be allowed to land in British South Africa without a permit. The Cape-Cairo telegraph line was constructed as far as Ujiji.—5th: The Government requisitioned 1,000 horses in the Cape Peninsula.—7th: The main portion of the Colony was cleared of Boers.—17th: General French reported the capture of Commandant Kritzinger and the dispersal of his commando.—30th: General Baden-Powell arrived at Cape Town.

Malta.—4th: The Council passed a resolution asking for the removal of the Chief Secretary.

Natal.—6th: Mr. Geo. Payne was appointed Treasurer.

Newfoundland.—15th: It was reported that Mr. Mareoni, at St. John's, had received messages by wireless telegraphy across the Atlantic from a station in Cornwall.—31st: The *modus vivendi* with respect to lobster-fishing on the French shore expired.

Orange River Colony.—6th: It was reported that De Wet had concentrated the Boers near Heilbron.—20th: Colonel Damant's corps was attacked by 800 Boers under Botha at Tafel-Kop.—24th: The Boers under De Wet rushed Colonel Pirman's camp at Tweefontein.

Transvaal.—2nd: Lord Kitchener reported further captures of the Boers.—4th: General Bruce Hamilton captured a Boer commando in the Ermelo district.—10th: General Hamilton's force captured the Bethel commando at Trichardsfontein.—11th: The financial position of the Transvaal was reported to be hopeful. Proclamations were issued with regard to natives' rights.—13th: General Hamilton's column captured Piet Viljoen's laager at Witkranz.—18th: An agreement was signed for the re-opening of the Delagoa line and the importation of natives for the mines, from Portuguese territory.—19th: The Johannesburg Stock Exchange was re-opened.—23rd: Many captures of Boers were reported. The corps of Burgher Scouts, raised from the refugee Boers did good service.

INDIA.

1st: Lord Curzon arrived at Lashio from Mandalay, and held a durbar of the Shan chiefs. The number of persons in receipt of famine relief was 92,000.—4th: It was reported that seventeen native princes and nobles had joined the Imperial Cadet Corps formed at Meerut.—5th: A column under General Denning was sent to suppress the Mahsuds.—9th: The Viceroy had a hearty reception on his arrival at Rangoon.—18th: Lord Curzon returned to Calcutta, having completed his tour.—23rd: The number of persons in receipt of famine relief rose to 107,000.—26th: The Indian National Congress was opened at Calcutta.—27th: The Indian Congress passed resolutions on the questions of famine, the separation of judicial and executive functions, and police reform.

FOREIGN COUNTRIES.

Abyssinia.—16th: It was reported that the Emperor Menelik refused to grant any mining concessions to the Abyssinian Exploring Expedition.—17th: The 201st kilometre of the Jibuti-Harar railway was opened.

Argentine Republic.—23rd: The Chamber passed a resolution prohibiting the export of horses and mules.—24th: It was decided not to press demands on Chili, and to submit the issue to the Boundary Commission.

Austria-Hungary.—7th: A public appeal was made to put an end to duelling.

Belgium.—5th: The new Army Bill was adopted in the Chamber.—16th: The Sugar Bounties Conference held its opening session in Brussels, and elected the Belgian Premier as President.—20th: The Government Sugar Bill was passed by the Chamber.—24th: The Senate passed the second reading of the Anti-Gambling Bill.

Bulgaria.—24th: The Sobranje rejected the proposed loan. The Premier announced the suspension of the sittings.—27th: The Karaveloff Cabinet resigned.

Chile.—13th: 30,000 men were called out to protect the mountain passes against the Argentine Republic.—14th: A basis of settlement of the frontier dispute was proposed by Chile.—22nd: Another contingent of the National Guard was called out.—26th: The dispute with the Argentine Republic was settled.

China.—2nd: The Empress continued to favour reform and re-organisation. Yuan Shih-Kai, the Viceroy of Chih-li, decided to make Tung-chau the capital of the province instead of Tien-tsin. The Boxers continued to give trouble in the North-east.—4th: Sir J. Mackay arrived at Shanghai. Yuan Shih-Kai proposed to re-organise the naval and military forces.—5th: Kuei-chun, Viceroy of Sze-chuan, was appointed Viceroy of Canton in succession to Tao-mu, resigned.—12th: The title of junior guardian of the Heir-Apparent was conferred on Sir Robert Hart and Shing Ta-jen.—16th: It was announced that the Court had left Kai-fong-fu for Peking.—22nd: The Court arrived at Tsze-chau.

Colombia.—4th: It was announced that General Diaz had agreed to surrender.

Corea.—29th: The Government permitted the Japanese to lay a cable and a wireless telegraph service between Fusan and Chemulpho.

Crete.—15th: It was decided to appoint Prince George as High Commissioner for a further term of three years.

Denmark.—27th: A petition was presented against the sale of the Danish West Indies to the United States.

Egypt.—3rd: The Khedive arrived at Khartoum and was enthusiastically welcomed by the native population.—4th: The Khedive held a levée at Khartoum.—5th: The Khedive reviewed 4,000 troops.—9th: The Khedive inspected the great dam at Assouan.

France.—6th: The Senate passed the China Loan Bill. The Chamber approved a Customs Tariff Convention between France and the Congo State.—10th: The annual banquet of the British Chamber of Commerce in Paris was held. The International Automobile Exhibition was opened in Paris.—17th: The Chamber decided to discuss the ecclesiastical estimates.—25th: Death of M. Henri Fouquier.

Germany.—2nd: Count von Büllov introduced the new Customs Tariff Bill in the Reichstag.—5th: The Marquis Ito arrived in Berlin.—15th: The Grand Duke Michael Alexandrovitch arrived in Berlin on a visit to the German Emperor.—18th: The Statue of Johann Georg, 7th Elector of Brandenburg, was unveiled in Berlin.—23rd: The marriage of the Grand Duke and Grand Duchess of Hesse was dissolved by a verdict of the Supreme Court of the Duchy.

Holland.—7th: Mr. Kruger took up his residence in Utrecht.—27th: The Second Chamber adjourned till February, after voting the estimates.

Italy.—16th: The Pope condemned the new Divorce Bill.

Japan.—10th: The Emperor opened the Diet in person.—28th: A meeting of National Unionists protested against Russia's continued occupation of Manchuria.

Peru.—9th: Congress passed a law definitely adopting a gold standard.

Russia.—4th: Marquis Ito left St. Petersburg.—27th: A draft of a new commercial treaty with Italy was signed.

Spain.—3rd: A motion of censure against the Minister of Finance was rejected in the Chamber. The infant son of the Prince and Princess of Asturias was baptized.

Sweden.—5th: The King accepted the resignation of Dr. Annerstedt, Minister of Justice, and appointed Dr. Hammarström as his successor.—10th: The Nobel peace prize was awarded.

Switzerland.—12th: The Federal Assembly elected M. Zemp (Catholic Conservative), of Lucerne, President of the Confederation for 1902, and M. Deucher (Radical) of Thurgau, Vice-President of the Federal Council.—25th: The Zionist Congress was opened at Basel.

Turkey.—3rd: An Iradé was issued approving the arrangement between the Porte and the Ottoman Bank for an advance of T.£600,000.—24th: General Edib Pasha was appointed Vali of Monaster.—27th: Further mutinies of unpaid Albanians were reported.

United States.—2nd: Congress was opened; M. Henderson was elected Speaker of the House of Representatives.—3rd: President Roosevelt sent his message to Congress.—4th: The report of the Isthmian Canal Commission favoured the Nicaragua route, and estimated the cost at \$189,864,000.—5th: The text of the Hay-Pauncefote Treaty was published.—10th: It was reported that the Nicaraguan Government had agreed to lease to the United States a strip of territory 6 miles wide, including the route of the proposed canal.—10th: Mr. Carnegie offered to present £2,000,000 for educational purposes. Mr. Wilbur Wakeman, appraiser of the port of New York, was called on to resign.—11th: Messrs. Redmond, McHugh and O'Donnell left New York in the *Oceanic*.—14th: The report of the majority of the Court of Enquiry condemned Admiral Schley for his conduct at the battle of Santiago.—16th: The Senate ratified the Hay-Pauncefote Canal Treaty.

Venezuela.—21st: A serious rising against President Castro, headed by General Mendoza, was reported.—28th: It was reported that the rising was spreading. Difficulties occurred with Germany on account of unpaid claims.

FORTHCOMING EVENTS.

UNITED KINGDOM.

London.—On the 7th inst, there will be an entertainment at Eaton Hall in connection with Princess Christian's Fund for CAPE TOWN CATHEDRAL.—On the 16th, at the Society of Arts, Mr. Francis H. Skrine will read a paper on "Bengal: the Land and its People."—On the 27th, Mr. J. Stanley Gardener will lecture at the Royal Geographical Society on "The Maldives Islands."—The annual meeting of the Association of Technical Institutions will be held on the 31st, Sir W. Hart Dyke, M.P., in the chair, when Lord Avebury will give an address.

COLONIES.

West Indies.—The fourth annual WEST INDIAN AGRICULTURAL CONFERENCE will be held at Barbados on Saturday and Monday the 4th and 6th inst. The members of this conference will consist of the principal officers, appointed by their respective Governments, connected with the chemical, botanical, and educational departments in the West Indies. There will also be present representatives of the chief agricultural societies in the West Indies and the technical officers on the staff of the Imperial Department of Agriculture. The object of the conference, as laid down by the Secretary of State, is the reading of papers and discussion on the scientific and economic aspects of the sugar-cane and other industries.

FOREIGN COUNTRIES.

Austria.—VIENNA FISHERY EXHIBITION.—Vienna is next year to be the scene of an international fishery exhibition, and the committee in charge of the arrangements invite the co-operation of all societies, clubs, and institutions connected with fishing, all commercial fishing enterprises, fishermen, anglers, fish fanciers, and fish breeders, as well as the representatives of all trades at home and abroad related to the fishing industry. Intending exhibitors should apply to the British Consul-General in Vienna for further information. (**Tetschen, Bohemia.**)—An exhibition of general manufactures will be held at Tetschen, Bohemia, from 15th July to 15th September, 1902. Tetschen is a growing town of 10,000 inhabitants, situated on the River Elbe. Its importance is relatively much greater than its size, as it lies close to the frontier of Germany, and Customs examinations and train changes occur there. Several public buildings will be used for the exhibition, and space therein should be engaged by 1st February, to insure against disappointment. Exhibits cannot be placed, however, before 1st June, and must all be on hand by 10th July. It is expected that reduced freight rates for exhibits will be secured on the railways and the River Elbe, and that the tariff laws will be suspended for their benefit. Further information can be obtained by addressing Der Vollzugs-Ausschuss der Ausstellung, Tetschen, Bohemia.

Belgium (Antwerp).—CARTOGRAPHIC EXHIBITION.—Under the auspices of the Royal Geographical Society of Antwerp, founded 25 years ago by General Wouvermans, an exhibition of cartography, ethnography, etc., is to be held in commemoration of the society's silver jubilee. Every endeavour (says the *Indépendance Belge*) will be made to bring together a collection illustrative of cartographic methods from the earliest times to the present. (**Lille.**)—AN INTERNATIONAL EXHIBITION, the first of its kind, will be held at Lille from May to September next. Installed on the Champ de Mars, its buildings and gardens will cover a surface of 150,000 square metres; a gallery of 3,000 metres will be reserved for machinery. The exhibition will comprise the following classes:—I. Education. II. Works of art. III. Liberal arts. IV. General machinery. V. Electricity. VI. Civil engineering, means of transport, cycles, motor-cars, sports. VII. Agriculture. VIII. Horticulture. IX. Forestry, hunting and shooting, fishing. X. Alimentary products. XI. Mines and metallurgy. XII. Furnishing, decoration and accessories. XIII. Yarns, tissue, clothing. XIV. Various industries. XV. Chemical industry. XVI. Social economy, hygienics. XVII. Colonisation, materials and products for exportation. XVIII. Special applications of alcohol (alcohol dénaturé) to motive power, heating, and lighting. Experiments in this direction are of the highest interest for the commerce and manufactures of the district. All entries and applications for information should be addressed to the Offices of the Administration of the Exhibition, 35, Rue Nationale, Lille.

Russia (St. Petersburg).—The opening of the INTERNATIONAL FISHERIES EXHIBITION will take place on the 15th/28th inst. In addition to those from Russia, applications and notices of exhibits have been received from France, Germany, Great Britain, Italy, Norway, Roumania, Japan, Egypt, and Siam. The Government has granted to the Imperial Russian Fisheries Society, which is organising this exhibition, a subsidy of 35,000 roubles.

Denmark.—AN EXHIBITION OF AUTOMOBILES is to be held in Copenhagen from April 11 to April 27, 1902.

NAVAL AND MILITARY INTELLIGENCE.

NAVAL.

Mr. Phillip Watts, of the firm of Armstrong, Whitworth & Co., has been appointed Director of Naval Construction, in the place of Sir W. H. White, resigned.

Captain Charles A. Adair, commanding the battleship *Royal Sovereign*, will succeed Rear-Admiral Charles Campbell in command of Sheerness Gunnery School.

The authorities of Chatham Dockyard have been informed by the Admiralty that the date of launching the *Prince of Wales*, battleship, has been fixed for March 25 next.

Orders have been given directing the turret ship *Cyclops* to be disarmed at Sheerness Dockyard, and placed on the non-effective list.

Captain Egerton, of the Torpedo Department at the Admiralty, has been selected for the command of the *Vernon*, torpedo ship, at Portsmouth.

The good service pension of £150 a year, vacant by the retirement of Captain A. Schömburg, has been awarded to Commodore Robert L. Groome.

Rear-Admiral T. S. Jackson, by the retirement of Admiral Adeane under the age limit, becomes first on the list of his rank, and will have very shortly to relinquish his position as Superintendent of Devonport Dockyard on promotion to Vice-Admiral.

The Admiralty have purchased a small Nielauss boiler which has been on view at the Glasgow Exhibition, and have ordered it to be fitted on a small steamboat for experimental purposes.

The *Grafton* will be commissioned at Chatham on January 14 by Captain Marx, with a complement of 571 officers and men, to relieve the *Warspite*, flagship, on the Pacific Station.

The *Espigle*, sloop, will be commissioned at Sheerness on January 21, with a complement of 113 officers and men, for the relief of the *Pigmy*, gunboat, Lieutenant and Commander A. H. Oldham, on the China Station.

Colonel H. St. G. Schömburg, C.B., has relinquished the command of the Chatham Division of Royal Marine Light Infantry, on promotion to the rank of Major-General, and was succeeded at Chatham by Colonel Roger Pine Coffin, the second commandant of the Plymouth Division.

The Admiralty have awarded the Good Service Pension of £300 a year, vacant in consequence of the death of Admiral Sir William H. Stewart, G.C.B., to Admiral the Hon. Sir Edmund R. Fremantle, G.C.B., C.M.G., Rear-Admiral of the United Kingdom.

The cruiser *Pearl* was commissioned at Devonport on the 17th ult. by Captain E. P. Ashe for service on the Cape of Good Hope and West Coast of Africa Station. The *Pearl* will relieve the cruiser *Philomel*, which was commissioned on December 1, 1898, at Devonport, to which port she is to return and pay off.

The *Fearless*, cruiser, Commander J. I. Graham, left Sheerness on the 15th ult. for China to relieve the *Brisk*, cruiser, Commander E. H. Martin. The following are particulars of her commissioned steam trial:—Steam pressure in boilers, 117 lb.; vacuum—starboard, 25.9 in., port, 26.4 in.; revolutions—starboard, 132, port, 133.1; i.h.p.—starboard, 1,080, port, 1,107, total, 2,187; speed, 14.5 knots.

The Devonport dockyard authorities have received instructions to prepare to build a battleship larger than any now existing. Its displacement will be 16,500 tons, and its length 425 feet. The previous largest battleship designed for the British Navy, one of the new *Queen* class, has a displacement of 15,000 tons, and length of 400 feet. The new ship will be known as of the *King Edward the Seventh* class.

Captain T. G. Greet commissioned the cruiser *Rainbow* at Devonport for service with the Cruiser Squadron, to which she will be an addition. This squadron, consisting of the *St. George*, *Juno*, *Brilliant*, *Rainbow*, *Hyacinth*, and *Minerva*, under Commodore Winslow, is due at Malta on January 20. The squadron will leave a week later for Alexandretta, where it will be augmented, for combined exercises, by other vessels belonging to the Mediterranean fleet.

Admiral E. S. Adeane, C.M.G., has been placed on the retired list of his rank. Consequently on this the following promotions have been made:—Vice-Admiral Sir H. F. Stephenson, K.C.B., to be Admiral in His Majesty's Fleet; Rear-Admiral J. W. Brackenbury, C.B., C.M.G., to be Vice-Admiral in His Majesty's Fleet; Captain C. Campbell, C.B., D.S.O., Ad.C., to be Rear-Admiral in His Majesty's Fleet. The following promotion on the retired list has taken place:—Rear-Admiral J. B. Warren to be Vice-Admiral.

The *Hogue*, cruiser, has undergone her contractors' steam trial at four-fifths power with most satisfactory results, and throughout the 30 hours that the ship was steaming at trial speed very rough weather was encountered, but this had little effect upon her machinery. A total horse-power of 16,456 was maintained, producing an average speed of 20.15 knots. The mean results were:—Steam in engines—starboard, 220 lb.; port, 226 lb.; vacuum—starboard—25.6 in.; port, 25.5 in.; revolutions—starboard, 113.1; port, 111.6; pressure in cylinders—high, starboard, 102.5; port, 104.3; intermediate, starboard, 34.7; port, 34.8; low (forward), starboard, 13.3; port, 13.8; low (aft), starboard, 13.5; port, 15.3; i.h.p.—starboard, 8,139; port, 8,137; coal consumption per i.h.p. per hour, 2.05 lb.

The *Bacchante*, first-class cruiser, which was built by Messrs. J. G. Brown & Co., of Clydebank, completed her trials on the 10th ult. The trials, at 4,500 i.h.p. and 16,000 i.h.p., proved very successful. The first full-power trial (21,000 i.h.p.), however, did not succeed, owing to heated bearings, and the vessel had to return to Sheerness to coal and remedy defects. Starting on the 7th ult. the machinery was found to be working well, and the eight-hours' full power trial was commenced. Throughout the vessel behaved admirably, while the machinery worked smoothly, and there was an absence of priming. The results were as follows:—Draught of water—forward, 25 ft. 9 in.; aft, 26 ft. 9 in.; speed of ship, 21.7 knots; steam pressure in boilers, 285 lb. per square inch; vacuum in condensers—starboard, 26.5; port, 26.5; revolutions per minute—starboard, 119.5; port, 120.4; mean i.h.p.—starboard, 10,812; port, 10,708—grand total, 21,520. The coal consumption was 292,800 lb., which represents 1.70 lb. per i.h.p. per hour, as against 1.75 lb. at 16,000 i.h.p.

France.—The *Le Yacht* states, in a description of the latest American boat *Shark*, which is of the same pattern as the British *Holland* boats, that France has always avoided the use of gasoline in the motors, owing to the danger which arises from its presence on board such craft. It is further noted that the American and British boats have only one torpedo tube, whereas the *Narval* has four. At Cherbourg the new submarine *Silure* has just been commissioned for her trials by Lieutenant de Penfentenyo, and it is stated that "our submarines and submersibles are now making frequent trips to sea. The time has come to see that they make their sea trials in a methodic fashion, and to submit them to progressive tests which will enable their true value to be ascertained."

Germany.—The *Cologne Gazette* states that the German navy budget for 1902 provides for the supply of a third river gunboat for China. The two boats at present there, the *Vorwärts* and *Schamien*, were formerly river passenger and cargo boats which were bought from the English during the recent troubles in China, and converted into gunboats. The first was built at Shanghai in 1899 and the second at Hong Kong in 1900. The new boat will be built in Germany and will be the first of the kind ever constructed there. It is destined for the Pei-ho river, where the German flag is at present unrepresented, the gunboats of the *Illis* class not being able to get beyond Tong-ku, the terminus of the railway from Peking. The German Admiralty has under consideration a new type of small cruiser, an improvement on the vessels of the *Gaselle* class. These last have a length of 328 ft.; beam, 38 ft. 7 in.; displacement, 2,660 tons; speed, 22 knots; and a complement of 249 men. The new type will have a length of 360 ft.; beam, 40 ft. 4 in.; displacement, 2,715 tons; speed, 24 knots; and a complement of 260 men. The armament has not yet been decided upon, but it will be more powerful than that of the *Gaselle* type and possess all the latest improvements, full advantage being taken of the results of experiments in other navies.

United States.—The Naval Estimates for the fiscal year ending June 30, 1903, while amounting to nearly \$99,000,000, or \$21,000,000 more than for the present year, only provide for the construction of three additional battleships and two armoured cruisers, as against two battleships and two cruisers in the present year. The largest increase is in the item of docks and shipyards. This is placed at \$20,000,000, as compared with \$6,000,000 allowed in the last Budget. A New York telegram states that the submarine boat *Fulton* underwent further trials on Saturday in Peconic Bay in the presence of Captain Geelmuyden, of the Norwegian Navy. The *Fulton* was first given a surface trial for the distance of a mile, and was then submerged for a longer run, at the conclusion of which two torpedoes were fired at imaginary targets. The trials were

considered to be completely successful, and Captain Geelmuyden is said to be satisfied with the performance of the *Fulton*.

MILITARY.

H.R.H. the Prince of Wales has been appointed to the honorary colonelcy of the 4th County of London Imperial Yeomanry (the King's Colonials).

Lieut.-Colonel James Hayes Sadler, His Majesty's Consul-General for the Somaliland Protectorate, has been appointed His Majesty's Commissioner in Uganda.

The King has been pleased to approve the appointment of Major-General Sir Herbert Charles Chermiside, R.E., G.C.M.G., C.B., to be Governor of the State of Queensland in succession to Lord Lamington.

Major and Hon. Lieut.-Colonel Everard, second-in-command of the 5th Leinster Regiment, the old Royal Meath Militia, has been appointed to command the regiment, which he joined over 30 years ago.

Colonel R. H. W. H. Harris, C.B., half-pay, who was severely wounded in the relief of Ladysmith, has been appointed to the command of the West Riding (33rd) Regimental District from January 1, succeeding Colonel H. B. Le Mottée.

Major Heseltine, Royal Fusiliers, who has recently returned to England from South Africa, has been appointed an extra Aide-de-Camp to Earl Cadogan, K.G., Lord-Lieutenant of Ireland.

Colonel E. H. Baldock, now commanding the Shropshire Imperial Yeomanry, is to be appointed Major, second-in-command of the 3rd (Sharpshooters) County of London Imperial Yeomanry, commanded by the Earl of Dunraven.

Lieut.-Colonel A. Creagh Macdonnell, instructor in surveying at the School of Military Engineering at Chatham, will be succeeded in February next by Major Charles Frederick Close, Royal Engineers, who was formerly connected with the Niger Coast Protectorate.

Sir Partab Singh, of Jodhpur, has been appointed Honorary Commandant of the new Imperial Cadet Corps in India. Of the first batch of native cadets passed in, four are ruling chiefs. The winter camp will be at Meerut—the scene of the outbreak of the Mutiny in 1854.

General French has permitted the use of railway bicycles, which run along the rails, sometimes attaining a speed of 30 miles an hour; and also of a motor railway cycle, which is being built, and will be capable of covering 40 miles an hour. These are used for patrolling purposes.

Colonel George J. Younghusband, C.B., Indian Staff Corps, who originally belonged to the Leicestershire Regiment, and has recently been in command of the 3rd Battalion Imperial Yeomanry at the front, has so far recovered from his wounds that he is returning at once to South Africa, instead of to India, as at first was intended.

The strength of the Russian military railway companies in the Trans-Caspian territory (says the *United Service Gazette*) is to be largely increased, and also the number of companies in the 1st and 2nd Railway Battalions of the Trans-Caspian Army. Each of these latter is now to have a sixth company, the cadres of the new formations being drawn from the Russian European Army. The two companies thus created are to be quartered in the Turkestan military district.

STATISTICAL NOTES.

India.—FOREIGN TRADE.—The following tables, taken from the Monthly Returns of the Trade and Navigation of India, show the imports into and exports from India during six months (April to September) of 1901, as compared with the corresponding period of 1900:—

SUMMARY.

I.—IMPORTS INTO BRITISH INDIA FROM FOREIGN COUNTRIES.

	Six months, 1st April to 30th September.		+ Increase. — Decrease.
	1900.	1901.	
	Rs.	Rs.	Rs.
I. Animals, living . . .	22,15,245	18,39,015	— 3,76,230
II. Articles of food and drink—			
Sugar	2,39,96,488	2,35,64,836	— 4,31,652
Other articles . . .	3,09,26,709	2,67,78,872	— 4,17,837
III. Metals and manufactures of—			
Hardware and cutlery, including plated ware . .	86,94,283	84,28,416	— 2,65,867
Metals	2,88,74,327	3,23,43,204	+ 34,68,877
Machinery and mill-work	1,02,77,907	1,35,02,068	+ 32,24,161
Railway plant and rolling-stock (other than Government stores)	64,43,659	1,23,91,612	+ 59,47,953
IV. Chemicals, drugs, medicines and narcotics, dyeing and tanning materials . .	96,18,277	1,11,47,179	+ 15,28,902
V. Oils—			
Mineral	1,42,10,507	1,88,61,020	+ 46,50,513
Other oils	14,44,070	16,84,975	+ 2,40,905
VI. Raw materials and unmanufactured articles	1,58,06,070	1,60,20,946	+ 2,14,876
VII. Articles manufactured and partly manufactured—			
Cotton yarn	1,16,90,479	1,43,72,748	+ 26,82,269
Cotton piece-goods .	11,46,47,030	14,66,24,749	+ 3,19,77,719
Other articles . . .	5,86,88,280	6,75,74,376	+ 88,86,096
Total merchandise . .	33,75,33,331	39,51,34,016	+ 5,76,00,685
Gold	4,61,16,732	2,39,49,662	— 2,21,67,070
Silver	2,18,92,031	5,05,98,526	+ 2,87,06,495
Grand total of imports .	40,55,42,094	46,96,82,204	+ 6,41,40,110

II.—EXPORTS FROM BRITISH INDIA TO FOREIGN COUNTRIES.

	Six months, 1st April to 30th September.		+ Increase. — Decrease.
	1900.	1901.	
	Rs.	Rs.	Rs.
Foreign merchandise exported	1,48,96,087	1,61,31,747	+ 12,35,660
Indian merchandise exported—			
I. Animals living . .	10,44,048	10,55,665	+ 11,617
II. Articles of food and drink—			
Rice	5,94,49,556	6,13,00,362	+ 18,50,806
Wheat and wheat-flour	21,20,817	2,03,57,624	+ 1,82,36,807
Tea	4,26,53,472	3,96,82,896	— 29,70,576
Other articles . . .	1,25,40,716	1,80,84,320	+ 55,43,604
III. Metals and manufactures of	20,26,418	17,15,699	— 3,10,719
IV. Chemicals, drugs, medicines and narcotics, dyeing and tanning materials—			
Opium	4,87,48,380	4,35,45,710	— 52,02,670
Indigo	20,86,424	32,14,676	+ 11,28,252
Other articles . . .	61,74,401	71,49,076	+ 9,74,675
V. Oils	34,81,673	31,92,300	— 2,89,373
VI. Raw materials and unmanufactured articles—			
Cotton	3,07,68,227	6,21,54,613	+ 3,13,86,386
Hides and skins . .	4,02,12,758	2,98,06,393	— 1,04,06,365

Representative Governors.—The Hon. W. P. REEVES (Agent-General), and THOMAS MACKENZIE, Esq. *Corresponding Agent in Colony.*—(At present through Agent-General's Office.) *Curator of Collection.*—(In temporary charge of Institute Staff.)

Products Exhibited.—Agricultural produce, building stones, coal, Kauri gum, hemp and flax, tinned meats, wools, tobacco, Kauri and other woods, with illustrations of their application to structural and ornamental purposes; photographs, etc., etc.

FIJI. (Middle of Central Lower Gallery.)

Representative Governor.—Gen. SIR ROBERT BIDDULPH, G.C.B., G.C.M.G.

Corresponding Agent in Colony.—Hon. JOHN HILL, Suva.

Curator of Collection.—(In charge of Institute Staff.)

Products Exhibited.—Barks, fibres, copra, tea, cocoa, coffee, timbers, etc.

BRITISH INDIA (AND ASIA).

INDIA. (East Gallery and Pavilion.)

Representative Governors.—Vide p. 32.

Special Sub-Committee, in charge of the Indian Section (appointed by the Secretary of State for India in Council):—*Chairman:* Major-General SIR OWEN TUDOR BURNE, G.C.I.E., K.C.S.I.

Members: SIR GEORGE C. M. BIRDWOOD, K.C.I.E., C.S.I.; G. W. VIDAL, Esq., I.C.S.; SIR E. C. BUCK, K.C.S.I.; W. COLDSTREAM, Esq., I.C.S., B.A.; C. H. MOORE, Esq.; T. W. HOLDERNESS, Esq., C.S.I.; SIR CHARLES J. LYALL, K.C.S.I., C.I.E.; Major-General JAMES WATERHOUSE.

Secretary: Mr. J. R. ROYLE, C.I.E.

Channel of Correspondence.—THE REVENUE AND AGRICULTURAL DEPARTMENT, INDIA.

Curator of Collection.—Mr. J. R. ROYLE, C.I.E.

Products Exhibited.—Fodder grasses, foods and food stuffs, sugar, spices and condiments, models of fruits, narcotics (including opium, ganja, etc.), tobacco and cigars, tea and coffee, oils and oil-seeds (including those of castor, sesamum, linseed, cocoa-nut and ground nut, etc.), a large assortment of drugs, dyes and tans, gums and resins (including the resins and turpentine of Indian pines, wax, lac, etc.), an extensive collection of fibres (including cotton, silk, jute, coir, reha, agave, etc.), models illustrating the manufacture of cotton and jute, minerals (including building stones, coal, mica, soapstone, corundum, iron ores, steel, etc.), timbers, collection of Indian pottery, carved woodwork, silver, brass and copper ware, silk and cotton fabrics.

CEYLON. (East Gallery.)

Representative Governor.—The Rt. Hon. the LORD STANMORE, G.C.M.G.

Executive Officer and Home Agent.—FREDK. H. M. CORBET, Esq., Barrister-at-Law.

Curator of Collection.—Mr. J. R. ROYLE, C.I.E.

Products Exhibited.—Cereals, pulses, edible fruits, roots and grains, spices and condiments, drugs, horns, skins, pearls, shells, wax, oils, gums, resins, dyes, tans, fibres, timbers, building stones, plumbago, metallic ores, rough gems, palm products, tea, coffee, cocoa, cinchona bark, sugar, tobacco, cotton-cloth, mats, rattan and basket work, wood and ivory carving, metal-work, pottery, tortoise-shell and porcupine quill work, lacquer work, lace, etc., etc.

STRAITS SETTLEMENTS (AND JOHOR).

(East Gallery.)

Representative Governor.—SIR CECIL CLEMENTI SMITH, G.C.M.G.

Corresponding Agents.—The COLONIAL SECRETARY (at Singapore); The Dato JAMES MELDRUM (for Johor). *Curator of Collections.*—(In charge of Institute Staff.)

Products Exhibited.—Barks, canes, drugs, fibres, preserved fruits (including Singapore pine-apples), mats, silk fabrics, oils and oil-seeds, dyes and tans, gums, gutta-percha, tin ores and other minerals, teas, coffee, spices, timbers, etc., etc.

MAURITIUS (AND SEYCHELLES).

(West Central Lower Gallery.)

Representative Governor.—[VACANT.]

Corresponding Agent in Colony.—Mr. A. DARUTY DE GRANDPRÉ, Museum Superintendent.

Corresponding Agent for Seychelles.—The Hon. E. B. SWEET-ESCOTT, C.M.G., Administrator.

Curator of Collection.—(In charge of Institute Staff.)

Products Exhibited.—Fibres, hemp, oils, rum, seeds, sugars, tortoise-shell, vanilla beans, with specimens of native workmanship, etc., etc.

HONG KONG. (Middle of Central Lower Gallery.)

Representative Governor.—SIR WILLIAM ROBINSON, G.C.M.G.

Corresponding Agent in Colony.—The HARBOUR MASTER.

Curator of Collection.—(In charge of Institute Staff.)

Products Exhibited.—China, carved and inlaid ivory and wood-work, silver and lacquer ware, silk and cotton fabrics, drugs, paints, dyes, food stuffs, etc., etc.

BRITISH NORTH BORNEO. (West Central Lower Gallery.)

Corresponding Agent.—(At present through the British North Borneo Co.)

Curator of Collections.—(In charge of Institute Staff.)

BRITISH POSSESSIONS (EUROPE).

MALTA, GIBRALTAR, AND CYPRUS.

(West Central Gallery.)

Representative Governor.—Gen. SIR ROBERT BIDDULPH, G.C.B., G.C.M.G.

Corresponding Agent.—(At present through the Representative Governor.)

Curator of Collections.—(In charge of Institute Staff.)

Products Exhibited.—From Malta—Carved stone-work, lace, macaroni, honey, various fabrics, models, pictures, etc., etc. Gibraltar and Cyprus—None at present.

IMPERIAL INSTITUTE JOURNAL.

VOL. VIII. No. 86.

LONDON.

FEBRUARY, 1902.

GENERAL NOTICES.

"THE IMPERIAL INSTITUTE JOURNAL."

An ornamental Cloth Cover, for binding the numbers of the JOURNAL for the year 1901 into one volume, may be obtained at the TICKET OFFICE of the INSTITUTE, or from Messrs. WATERLOW AND SONS LIMITED, Blomfield-house, London-wall, E.C., price 2s. 6d. Bound volumes of the JOURNAL for the seven years, 1895-1901, may be had at 10s. each.

Fellows resident in the United Kingdom, the Colonies, India, and Foreign Countries, are supplied with the JOURNAL free by post each month.

The Subscription to the JOURNAL from other than Fellows, both at home and abroad, is as follows, including Postage, and Posted Monthly:—

Yearly . . . 8s. 6d. | Half-yearly . . . 4s. 6d. | Quarterly . . . 2s. 6d.

Subscribers to the JOURNAL can have it forwarded by post on each day of publication by payment in advance. Post Office Orders or Cheques should be made payable to the Editor, at the Imperial Institute, South Kensington, S.W., to whom also all communications relating to the JOURNAL should be addressed.

The JOURNAL may also be purchased for Sixpence each copy at the Ticket Office of the Institute and at the railway book-stalls of Messrs. WILLING & CO.

The City Agents for the JOURNAL are Messrs. WILLING & CO., 17, Royal Exchange, London, E.C. It may also be obtained at the offices of the printers, WATERLOW & SONS LIMITED, Blomfield-house, London-wall, London, E.C.

Communications respecting Advertisements should be addressed to the ADVERTISEMENT MANAGER, 6, Arundel-street, Strand, London, W.C.

 This JOURNAL is distributed (by post) throughout the United Kingdom, India, and the Colonies of the British Empire, and to the following Foreign Countries:—Argentina Republic, Austria-Hungary, Belgium, Bolivia, Chili, China, Colombia, Costa Rica, Denmark, Egypt, France, Germany, Greece, Hawaiian Islands, Holland, Italy, Japan, Mexico, Montenegro, Morocco, Norway, Persia, Peru, Portugal, Russia, Siam, Spain, Sweden, Switzerland, Tripoli, Turkey, United States of America, Uruguay, and Venezuela. The JOURNAL is also placed in the Reading Rooms of CHAMBERS OF COMMERCE, CLUBS, and HOTELS, both at home and abroad.

THE FELLOWS' DEPARTMENT.

The Reading, Writing, and News Rooms, are open for the use of Fellows every week-day from 10 a.m. till 11.30 p.m., and on Sundays from 3 p.m. to 10.30 p.m. The Library (on the First Floor), is open from 10 a.m. to dusk on Week-days, and from 3 p.m. to dusk on Sundays. The Map Room (First Floor) is open from 10 a.m. to 5 p.m. on Week-days.

The Poste Restante is open every week-day for receipt and delivery of letters and parcels. Letters addressed to initials only are not received, except in reply to notices in the JOURNAL, under "Requirements" Registry. The General Post Office Pillar Box is cleared daily twelve times, between 10.10 a.m. and midnight.

Light refreshments only are, for the present, provided in the Fellows' Rooms and at the bar of the Ceylon Kiosk.

LECTURE AND CONCERT ARRANGEMENTS.

LECTURES.

An Illustrated Public Lecture will be given on every Monday evening during the remainder of the season. The following have been arranged for February:—

Mon., 3rd Feb., at 8.30 p.m. "The Native Races of Nigeria," by C. F. HARFORD-BATTERSBY, Esq., M.D., Principal of Livingstone College. *In the Chair:* T. F. V. BUXTON, Esq., J.P.

Mon., 10th Feb., at 8.30 p.m. "The Coloured Races in Australia," by the Hon. Sir HORACE TOZER, K.C.M.G., Agent-General for Queensland. *In the Chair:* The Right Hon. LORD LAMINGTON, G.C.M.G., late Governor of Queensland.

Mon., 17th Feb., at 8.30 p.m. "The Obstacles to Development in West Africa," by C. F. HARFORD-BATTERSBY, Esq., M.D., Principal of Livingstone College. *In the Chair:* Admiral the Right Hon. Sir JOHN DALRYMPLE HAY, Bart., K.C.B., F.R.S.

Mon., 24th Feb., at 8.30 p.m. "British Columbia," by the Hon. J. H. TURNER, Agent-General for British Columbia.

The fixtures for the subsequent Monday evenings of the Lecture Season will be announced in due course.

Admission to the Lecture-Hall by the first entrance to the Imperial Institute coming from Exhibition Road.

Seats are reserved for Fellows, who have also the privilege of admitting two Friends for each Lecture, or Address, by reserved seat tickets.

CONCERTS.

The EVENING CONCERTS for Fellows and their friends will be continued during the Winter Season, 1901-2, and will take place in the JEHANGIER HALL on certain Wednesday evenings, the dates of which will be announced in due course.

The following Concerts will take place this month:—

Wed., 5th February, 8.30 p.m. CONCERT by the IMPERIAL INSTITUTE (AMATEUR) ORCHESTRA. *Chairman of Orchestral Committee,* FRANK H. BUTLER, Esq. *Hon. Leader,* LOUIS H. D'EGVILLE, Esq. *Hon. Conductor,* A. RANDEGGER, Esq.

The programme will include the following:—

SYMPHONY IN B MINOR (unfinished)	Shubert.
INTRODUCTION TO ACT III. "Tannhauser"	Wagner.
SONG CYCLE "Summer Time"	Landon Ronald.
(Conducted by the Composer).	
OVERTURE "Rienzi"	Wagner.
JUDEX "From 'Mors et Vita'"	Gounod.
VALE "Schatz"	Johann Strauss.
PIANOFORTE CONCERTO, No. 2, IN G MINOR, Op. 22	Saint-Saëns.
MISS MARGUERITE ELZY.	

Vocalist . . . MR. HENRY BOULDERSON.

Wed., 19th February, 8.30 p.m. CONCERT by the STUDENTS of the ROYAL ACADEMY OF MUSIC, under the direction of Sir ALEXANDER C. MACKENZIE, Mus.Doc., LL.D., F.R.A.M.

Fellows have free admission to the Concerts, and can purchase tickets at 2s. 6d. each) for the admission of their Friends.

THE SCIENTIFIC AND TECHNICAL DEPARTMENT.

The Scientific and Technical Department of the Institute has been established to acquire information by special enquiries and by experimental research, technical trials and commercial valuation regarding new or little known natural or manufactured products of the various Colonies and Dependencies of the British Empire and of foreign countries, and also regarding known products procurable from new sources, and local products of manufacture which it is desired to export. This work is carried out with a view to the creation of new openings in trade, or the promotion of industrial developments.

In the extensive and well-equipped series of Research Laboratories occupying the West Corridor of the Second Floor, a staff of skilled Chemists, under the direction of Professor Wyndham R. Dunstan, M.A., F.R.S., carry out the investigation of the chemical constitution and properties of new dye, stuffs, tanning materials, seeds and food-stuffs, oils, gums and resins, fibres, timbers, medicinal plants and products; animal products, minerals and ores-soils, cements, and various other products, with a view to their commercial utilization. Whenever necessary these materials are submitted to special scientific experts, by whom they are made the subjects of particular investigation or practical tests. Reports are also obtained from technical or trade-experts in regard to the probable commercial or industrial value of any such products, whilst full information is collected from official or other trustworthy sources regarding the probable extent and cost of available supplies. All materials requiring scientific or technical examination, or commercial valuation, should be submitted to the Institute for examination either by, or through, the Foreign Office, the Colonial Office, the India Office, or the Board of Trade, or through the Colonial or Indian Government Authorities. Requests for the examination of such materials may also be submitted by Public Commercial Bodies and Institutions of the respective Colonies and Dependencies, or by the Representatives of H.M. Government in foreign countries.

COMMERCIAL INTELLIGENCE DEPARTMENT.

The Office of this Department, in the West Corridor, First Floor, is open daily from 10 a.m. to 5 p.m. (on Saturdays till 1 p.m.), for the purpose of answering enquiries and supplying information relating to the Commerce (Export and Import) and Industries of India and the Colonies. Applications may be made personally or by letter. Special information may be obtained from the Curators in charge of the Indian and of certain Colonial Collections. Arrangements have been made for the translation for mercantile firms of Trade Circulars, Price-Lists, and Catalogues into any Foreign Language, including the conversion of weights, measures and coinages, etc., at cost price, and application for such may be addressed to this Department.

THE COMMERCIAL COLLECTIONS.

The Galleries containing the Colonial and Indian Collections, and the Public Commercial and Industrial News Room, are open for free inspection by the public daily, *except Sundays, and any days specially notified*, from 11 a.m. until 4 p.m. Every information concerning the products, their supply, etc., can be obtained on application to the Curators of the Indian and Ceylon, Canadian, and South African Sections, to the general Curator, and to the Commercial Intelligence Department.

CITY BRANCH OF THE IMPERIAL INSTITUTE.

The City Branch of the IMPERIAL INSTITUTE, at 112, Cannon-street, E.C., is open to Visitors on week-days from 10 a.m. till 5 p.m. The Branch includes a News Room, supplied with many British and Foreign Commercial Publications, Market Reports, etc., and an Enquiry Office in telephonic communication with the Commercial Information Office of the Imperial Institute. The News Room and Enquiry Office are free to Fellows of the Institute; other persons are admitted on payment of £1 annually.

Subscribers are entitled to inspect, *free of charge*, any maps or charts included in the Map Room collection at the Imperial Institute, South Kensington, and to consult any works, or official papers, included in the Institute Library.

The Information Department will undertake to obtain analytical or other examinations of samples by competent Experts, upon payment, by persons submitting them, of the usual professional fees, to be previously specified, and agreed to by the applicant. (*For further information see page 48*).

THE NORTHBROOK SOCIETY.

The Northbrook Society is affiliated to the Imperial Institute, and has a special room allotted for the exclusive use of its members in the Institute buildings. Its primary objects are to watch over and promote the interests of natives of India, and to provide a system of guardianship or supervision over such as are sent to Europe for education. The Society is controlled by a committee consisting of an equal number of Governors of the Imperial Institute and members of the Society, presided over by the Earl of Northbrook. It possesses an excellent library. Indian members, who pay no subscription to the Society, have the especial advantage of becoming Fellows of the Institute at half the usual subscription payable by the ordinary Fellows. Applications for membership of the Society should be addressed to the Secretary of the Northbrook Society, Imperial Institute, London, S.W.

EMIGRATION INFORMATION OFFICE.

The Office of the British Women's Emigration Association (*see page 50*), in the West Corridor, First Floor, is open daily from 10 a.m. to 4 p.m., and advice and information respecting emigration and openings in the Colonies may be obtained there free of charge. Enquiries of all kinds relating to the Colonies from intending Emigrants are dealt with in the Commercial Intelligence Department, and special information respecting Canada and the Cape Colony may also be obtained from the Curators for these Colonies, on application personally at their offices, or by letter.

THE IMPERIAL INSTITUTE.

SPECIAL MEETING OF THE GOVERNING BODY.

A very important Meeting of the Governors of the Imperial Institute was held on Saturday the 21st December, 1901, at York House, St. James's Palace, under the Presidency of HIS ROYAL HIGHNESS THE PRINCE OF WALES.

The following Members of the Governing Body were present:—H.R.H. The Prince Christian, Lord James of Hereford, The Lord Chancellor, Lord Kelvin, The Earl of Crewe, Lord Sandhurst, Lord Iveagh, Sir Frederick Abel, Colonel W. T. Makins, Sir Robert Herbert, Sir Charles Elliott, Sir J. Wolfe Barry, Mr. F. A. White, Mr. A. Prevost, Mr. J. M. Paulton.

Representing the Government of India.—Sir Owen Tudor Burne, Sir James Peile, Sir Henry Bliss, Sir Stuart Bayley, Sir F. F. Adam, Sir Raymond West, Mr. A. Cadell, Mr. J. S. Gamble, Mr. W. Coldstream, Mr. W. C. Bennett, Mr. G. W. Vidal, Mr. T. W. Holderness.

Representing Canada.—Sir Henry Tyler, Mr. Thos. Skinner, Mr. C. A. Duff Miller.

Representing New South Wales.—The Hon. H. Copeland.

Representing Tasmania.—The Hon. A. Dobson.

Representing Cape Colony.—The Hon. Sir David Tennant.

Representing Natal.—Sir Walter Peace.

Representing Hong Kong.—Sir Wm. Robinson.

Representing Straits Settlements.—Sir Cecil Smith.

Representing Gibraltar, Malta, Cyprus, Bermuda, Fiji, Falkland.—Gen. Sir Robert Biddulph.

Representing Jamaica, Bahamas, Windward Islands, Barbados.—Sir Henry Norman.

Representing British Honduras.—Mr. J. M. Currie.

Representing the South-eastern, Midland, and Northern Districts of England.—Mr. R. M. Littler, Mr. F. Elkington, Sir Lowthian Bell, Sir B. C. Browne.

Representatives for the time being of Associations.—Sir John Evans, Sir John Watney, Mr. J. E. Reynolds, Mr. Geo. Beilby, Mr. W. J. Davis, Mr. C. D. Higham, Mr. W. H. Maw, Mr. Chas. Hawkesley.

Letters expressing regret at inability to attend were received from the following Governors:—The Archbishop of Canterbury, The Lord Chief Justice, The Lord Mayor of London, The Earl of Ducie, Lord Elgin, Lord Rothschild, Lord Strathcona, Sir Henry Fowler, The Lord Provost of Edinburgh, Sir J. Taubman-Goldie, The Hon. R. A. Grainger, Mr. J. I. Rogers, Sir Henry Waring, Sir Daniel Cooper, Mr. Wm. Emerson, Mr. Austin R. Whiteway, Sir James Musgrave, Sir Wm. H. Preece, Mr. Howard Spensley, Sir Wm. Houldsworth, Mr. John R. Wigham, Sir John Llewelyn, Mr. W. Langdon.

Sir Horace Tozer (Queensland) also expressed regret at having been accidentally prevented from attending.

In opening the proceedings, the Prince of Wales said:—Your Royal Highness, My Lords and Gentlemen, you must permit me to say what great satisfaction I have in presiding over you to-day, as the President of the Imperial Institute. I naturally recall the great interest taken in its foundation and fortunes by our late beloved Sovereign. As you know, I have had many opportunities of witnessing the practical interest ever taken in your proceedings by the King, and I hope that you will also consider that I have not been myself entirely unmindful of your interests. It, therefore, gives me very great pleasure to find myself presiding over so important a gathering.

For the present, I have only to inform you that matters of great importance connected with the Institute will be brought to your notice. I will now ask Lord James to explain the proposals to be submitted to you.

LORD JAMES OF HEREFORD said:—Your Royal Highnesses, my Lords and Gentlemen, I am quite sure, Sir, that my colleagues on the Governing Body of this Institute would wish that the first words to be addressed to you should convey very grateful acknowledgment of the fact that you have accepted the Presidentship of our Institute. The objects of this Institute, the great interest ever taken in its fortunes by our beloved great Queen, the practical interest in our affairs that His Majesty has ever shown to us,—have all conduced to the one central feeling that you, and you alone, Sir, could fittingly occupy the Presidentship of the Institute. And having gratefully thanked you for this, I will now submit to the Governing Body matters which you have rightly described as of grave importance to the future fortunes of the Institute.

In order to fully explain the nature of the suggestion—and it is only a suggestion—which I have to submit for the consideration of the Governing Body—a short retrospect will be necessary. It will be recollected that, by its Charter, the objects of our Institute were declared to be: to increase the commercial dealings of the nation; to provide intelligence regarding its commerce, and to bring together the further ends of that great Empire over which Her Majesty QUEEN VICTORIA had so beneficently ruled for fifty years. That was the primary object of our creation. But when we came into existence, acting under our Charter, certain other objects, which seemed to be advisable, were carried into effect; and all of us, taking the responsibility of such policy, endeavoured to combine with the commercial objects to which I have referred, the creation of something of a popular and attractive nature existing within the Institute itself. That policy was one in which my great friend the late Lord Herschell took deep interest; and, together with him, we endeavoured to carry it into effect. Well, you will recollect that some three years ago, we found that that portion of our policy was a failure. It had produced financial difficulties so great that we saw not how they could be overcome, unless certain action in a new direction was taken—and we took it. We were losing four or five thousand pounds a year by giving the public entertainments, and they were brought to an end. Then we relieved ourselves of great burdens by assigning to the Government a portion of our Buildings, and also our liabilities. As I stated last year, this change of policy has been actually and entirely successful, with the result that, in consequence of our exemption from pecuniary liabilities, our relief from the payment of about £4,000 a year for parochial rates, taxes, etc., and having our building secured to us, with external repairs and cost of heating defrayed by the Government, we are now in this fortunate position,—that we have an excess of income over expenditure of at least £2,000 a year. We are in a financial position of thorough soundness. Our property is relieved of all debt, and we possess property in buildings, site and collections, absolutely unrivalled, with invested funds amounting to £1,400,000. The property at our disposal certainly amounts to about half-a-million of money. Being in such a satisfactory position, I am sure the Governing Body will agree with me that it is absolutely necessary to see that these great resources are not wasted. We have to carry out the primary objects of our Charter, and we must set ourselves to accomplish this task. And so we set to work and sought the aid of those who could help us most; we appealed to Lord Salisbury, who gave us one of his ablest representatives; to Mr. Chamberlain, who also nominated a representative of his department, whom he thought would be the most active; to the India Office, who also rendered us assistance. And so we formed an Advisory Committee, with the object of working hard in disseminating information of commercial value. We have sought to go into every colony, and appeal to its Government; and, through the Foreign Office, have requested our Consuls in every foreign town to disseminate amongst foreign communities a

knowledge of our commerce. We have invoked the India Office, and have also appealed to the Board of Trade to see what could be done at home.

When we approached the Board of Trade we found a strange state of things existing. It had formed a Consultative Committee from exactly the same sources that we had; it had also appealed to the Foreign, Colonial and India Offices for representatives. And, as we had appealed to the Board of Trade for assistance, so the Board of Trade appealed to the Institute to help them, and thus Sir Frederick Abel had actually been called upon to guide and assist the Board of Trade in their councils. Also, strangely enough, whilst the agencies were similar, the objects were precisely the same. The Authorities of the Board of Trade wished to go to the Colonies; they wished to go to the Foreign Office, to the Chambers of Commerce here in England, to effect exactly the same objects as those which we had in view. The position had thus reduced itself to this: we had given up entertainments, we had concentrated our force upon strictly commercial intelligence objects, but now we found ourselves walking exactly on the same path in the same field, and appealing to the same people as that great and powerful body the Board of Trade. Now this is the relative position. The Board of Trade was a Government Department, and, as representing the nation, they have a great goodwill and power we do not possess; they can speak in the name of their Government; their Colonial Committee can speak in the name of the Colonial Office; their Foreign Committee in the name of the Foreign Office, and so on. So, of course, this important public body possesses great advantages over us, a semi-public body. But, whilst they have this goodwill and great power in comparison with us, we have a great power in comparison with them. We are in possession, at this moment, of an annual contribution of £2,000 from the Royal Commissioners for the Exhibition of 1851, which we have undertaken to devote to the maintenance of laboratories which, I believe, both in their guidance and results, are unique in acquiring scientific knowledge of commercial importance. The results of the researches there carried out, and of their commercial value and application, are sent out to the world through our Commercial Intelligence Department. Well, the Board of Trade is wanting in such a Scientific and Technical Department. We have, beyond this, a magnificent group of forty-two collections, representing the products of our great dependency, India, and of all our different Colonies—a collection unrivalled in the world, because there is no other empire which can secure such a gathering of products from its great constituent bodies. There is also still vacant space in the galleries at the disposal of the Imperial Institute to extend the scope of our operations.

Now, Sir, what is the result of all this? We are in direct competition with the Nation through the Board of Trade; we find ourselves in danger of being beaten wherever we go. Now, they, on the other hand, require assistance to make their action perfect and complete, and what they—the more fortunate Board of Trade—require, is the means of forming a dépôt, a Clearing-house of Commercial Products; a Sampling-house; this we have at our disposal, while they possess a powerful agency which we do not. And now, Sir, we, who have charge of the immediate action of the Institute, find ourselves with its great objects in view, and these great means of carrying them out; but, at the same time, face to face with a competition against which, speaking frankly, we shall have great difficulty in successfully contending. It is a useless competition, and an unsatisfactory competition, even if we succeeded, but it is more useless and more unsatisfactory if we make the attempt to succeed and then fail. Speaking for Sir Frederick Abel and myself, we have come to the conclusion, in considering how best the purposes for which the Institute was founded can be carried into effect, that it is our duty to submit to the Governing Body of the Institute, for consideration, two proposals which will, we believe, best carry out the objects to which I have referred.

Well, the first of these proposals is that this great property, with the resources for the attainment of its great objects in view, shall be presented to the Nation. We ask to present it to the Nation, for whose benefit the Institute came into existence. We think it should be presented so that the Governing Body shall be able to pass over to the representatives of the Nation—the Government—this great property, valuable, unburdened, full of power and utility, for the purpose of carrying out the objects for which the Imperial Institute was founded.

But I may state to you that, in our opinion, it should not be an unconditional gift. There are attached certain trusts, which are in the nature of so-called charitable trusts. This Institute was founded for the purpose of specially benefiting the Colonies and Dependencies. These benefits must still be retained. It must be a term of the transfer that the Colonial and Indian interests shall be protected fully and never lost sight of in carrying out the change.

We now ask you to reflect seriously upon what can be said in respect of these propositions. We should not have ventured to resolve them into their present shape if we had not had one object in view—that greater utility should be given to the Institute, and that the Colonies and Dependencies of the Empire should receive more benefit than they reap at present. Taking into consideration all that exists, we believe that by adopting the proposals I have suggested to you, great benefit will be conferred on the Nation, in the interests of its trade and commerce, and in the spread of its commercial prosperity, by making this great agency receive within itself new life and power by conferring upon it Government responsibility.

I hope that if your resolution should be that it is desirable to take this course, that the Government will be disposed to consider the offer in a generous spirit. I know that it has been found necessary to take you somewhat by surprise, but it seems, so far as I can judge, that it will be necessary, before this transfer can be made, that a private bill should be passed through Parliament, and when that takes place, any exceptions which might be made to the proposal will be fully considered.

I do not know whether I need mention individuals, but upon receiving intimation from two of our body on whose judgment I place much value—Sir Henry Fowler and Lord Rothschild—that they could not attend this meeting, I thought it advisable to tell them the nature of the proposition which would be made, and I have received from both of them letters very strongly approving of the suggested course.

There only remains for me to say one word more. I hope you will forgive me if I refer to myself. I was one of those, who in a country-house in Scotland in 1886, took part in resolving the idea of an Imperial Institute. During the lifetime of the late Lord Herschell I gave such assistance as I could to the Governing Body. Since his death I have taken the present responsibility which has been thrown upon me, and it is a responsibility I could never have borne but for the generous and devoted assistance of my friend Sir Frederick Abel. Occupying the position on the Governing Body which we do, we naturally entertain feelings almost of affection towards the Imperial Institute, and I say, speaking for both of us, that, having given our very best consideration to this matter, and to the future of the Institute, we feel that in loyalty to this body, we are entitled to commend, as we do commend, this proposition to your Royal Highness and to the Governing Body.

Having been invited by His Royal Highness the President to address the Governors, the LORD CHANCELLOR said:—It will be impossible for me to address you, Sir, on the present occasion without giving voice to the sentiment, which I am sure we all feel, that it is a matter of hearty congratulation that we should find you at our head on this occasion, after you have given the most conclusive proof of your interest in all that binds the Empire together, by the long voyage you have taken, and by the labours you have gone through, and it is with the heartiest congratulations of everyone here that we welcome you back to these shores, which your position and your personal qualifications have done so much to adorn.

With reference to the Resolution which has been placed in my hands, I really do not think, after the statement which has been made to you by my noble friend, that it is necessary for me to go into the particulars whereby that Resolution should be commended. I suppose

everyone who is acquainted with business, and has had anything to do with any kind of organisation among mankind, must know that if there is one thing more calculated to render effort unsuccessful, it is the squandering of forces of those who are interested in different and competing bodies. And it appears to me that this is the position with reference to the Board of Trade and the Imperial Institute. It is impossible not to see that, in order to carry matters to a successful issue, there must be unity of design and unity of administration; otherwise, as I have said, you squander your forces in vain efforts of a useless competition between two persons in the same field, working at the same objects. That difficulty must be got over; and I must say for myself, after giving full consideration to this matter, that I have come to the conclusion that, in order that the real objects of this Institute should be fulfilled, it is absolutely necessary that the first place should be taken by either the Board of Trade or the Imperial Institute. It is impossible not to see that the powers of the Government, and their mode of administration, must be the one to prevail.

I now beg to move the following Resolution:—

“That this meeting of the Governing Body of the Imperial Institute, believing that its objects and purposes will be best carried out by the Institute and its property being transferred to the Nation, hereby approves of such transfer.”

SIR DAVID TENNANT, in seconding the Resolution, said:—When we look back upon the past history of the Institute, and recall the strenuous efforts to create a success, which has been so long delayed, we must feel sure that the further continuance of the Institute, on its present lines under the existing circumstances, will not achieve that advance which we are all so desirous of obtaining. Division is always to be deprecated. Under these circumstances, I think we should do wisely to adopt the Resolution, and I am sure the Colonies will heartily respond to the suggestions made,—that there should be one undivided authority; that that authority should be the Government; and that the Government should bring to its aid such counsel as they deem advisable for the furtherance of the objects of the Institute, and to secure for it a permanence which otherwise it might fail to obtain.

I, therefore, most heartily second the Resolution, and feel sure that it will receive the unanimous support of all the Governing Body, who take a deep interest in the welfare of this country, of its Colonies, and the progress of trade.

SIR WALTER PEACE said:—I think myself that this proposal, which has been sprung upon us somewhat as a surprise, will depend, for what measure of approval it will receive in the country, upon the answer which will be made as to how His Majesty's Government will utilize the Institute after the premises have been transferred to it. Whether it is to be made a vitalising influence, which will accomplish the objects which we all desire, or whether the transfer to the Government is of something which we could do nothing with, and will be made without our knowing what steps the Government would take to fulfil the objects and purposes for which the Institute was founded, I feel that the general opinion will be to desire that information.

MR. W. J. DAVIS (representing the Trades Union Congress of Great Britain) said:—I represent the working men of England, and although the Resolution was a great surprise to me, I entirely fall in with it. The Government manage their great Institutions so well that they are popular throughout this country. We have the assurance that this will not be an unconditional gift to the Nation, and I think that this answers the remarks of Sir Walter Peace. But if we found that the original objects and purposes of this great Institute were to be perverted, there would of course be considerable opposition to the proposal. The question of overlapping is a very serious one in all great institutions; we see instances of it in the educational system and in the Local Government Bodies. I, therefore, think that the case is well made out. We all appreciate the difference between times of adversity and times of prosperity: now is a time of prosperity for the Institute, and I feel that we should take the opportunity of presenting it to the Nation.

LORD JAMES said:—In reference to the remarks of Sir Walter Peace, I can assure Sir Walter that, so far as it lies within our power, his views shall be carried into effect. I pointed out in my statement that this is not to be an unconditional gift; we are not going to let the Government do what they like with the Institute; they will have to undertake to carry out the objects for which it was founded. The Representatives of India and the Colonies will have ample opportunity of considering the terms upon which the transfer will be made, and the full concurrence of the Governing Body will be sought after they have had full information.

SIR OWEN TUDOR BURNE said:—I should like to say a word, as one of those who have represented India upon the Governing Body of the Institute from the time of its birth. I think it is very satisfactory to learn that the proposed gift will not be made without certain conditions. Especially do I say this, because, among many who are here I represent a country which, after all, contributed a large proportion of the funds subscribed, and has been foremost in advancing the objects of the Institute—I refer to India. It is very satisfactory to learn that the Indian Authorities will be fully consulted in this matter, in regard to the handing over of the gift under certain conditions; and I hope that the Memorial character of the Institute will be maintained. That Institute was built with the concurrence of our late most gracious Sovereign as a Memorial of her Reign; and I trust that if we do hand it over to the Nation, this point will be kept in view from first to last.

The Resolution was then submitted to the meeting by the PRINCE OF WALES and carried unanimously.

LORD KELVIN said:—I have the honour to propose that the following members of the Governing Body, with power to add to their number, be appointed a Committee for the purpose of carrying the Resolution just passed into effect:—The Lord Chancellor, the Lord James of Hereford, the Lord Chief Justice, Sir Henry Fowler, Sir Robert Herbert, Sir Owen Tudor Burne, and Sir Frederick Abel.

The Hon. H. COPELAND said:—With reference to the Resolution proposed by Lord Kelvin, I have no objection whatever to offer to it, and have great pleasure in seconding it. I should like, however, to say one word with reference to the Resolution which has just been passed, and to ascertain whether it is intended to keep a Standing Committee in the interests of the Institute, so as to take care that the Government act up to what we consider to be the best policy in the interests of the objects of this Institute. It would be desirable to have a Standing Committee for that purpose, and such a Committee should be a little more representative than the one just announced by Lord Kelvin. I think that it should include at least one Representative of each of the great portions of the Empire—India, Canada, Australia, and of all the States who have helped to build up the Institute, so as to see that the Government are kept up to the mark. Governments often take matters in hand which afterwards, owing to something else more important turning up, are apt to get shelved, and such poor little matters as the Imperial Institute might get overlooked. Therefore it would be desirable to keep a representative Committee always in existence to look after the interests of the Institute.

LORD JAMES said:—We have placed in Resolution No. 2 the words “with power to add to their number,” which I trust will meet the point raised by Mr. Copeland.

After the PRINCE OF WALES had put to the Meeting the second Resolution, which was carried unanimously, he said:—Your Royal Highness, my Lords and Gentlemen, I only wish to say that, before the proposal had been submitted to you, I did not wish to offer any opinion, but now that it has been sanctioned by you, I should like to express my complete satisfaction with your decision, and I am sure that you will be glad to hear that the King entirely approves of the course to be adopted.

FINANCIAL AND COMMERCIAL RETROSPECT.

UNITED KINGDOM.—The Board of Trade returns for December were more satisfactory than they have been for several months. In comparison with the returns for December, 1900, which had the same number of working days, there was an improvement in the imports, which were valued at £46,770,097, of £323,435, or 0·7 per cent., while the exports of British and Irish produce, valued at £24,313,777, showed an increase of £701,805, or 2·9 per cent. The re-exports were worth £5,912,247, against £5,087,220 in the preceding December. In the imports the increase was pretty generally spread over every class of article except living animals, duty-free articles of food and drink, manufactured articles and metals. Cattle fell off by about 18 per cent. both in numbers and in value, but sheep rose 66 per cent. in the former respect and 68·5 in the latter. Bacon, beef, butter, cheese, and mutton all increased both in value and in quantity. The shipments of wheat from Argentina fell considerably, and, as a result, in spite of larger supplies from the United States, the total arriving in this country was 3·2 per cent. less than in the preceding December, while a fall in price reduced its value by 7·8 per cent. Wheat flour, however, increased in amount by 47,000 cwt., though its value was slightly less. Barley rose 38·3 per cent. in quantity and 35·2 in value, and in oats, owing to larger supplies from Russia, there was a rise of 51·2 per cent. in quantity and of 82·4 in value. In Indian corn, on the other hand, there was a fall of over 2,000,000 cwt., while the value was reduced by nearly £600,000 (28·6 per cent.). In refined sugar there was an increase of 26 per cent. in quantity and 9·7 in value, while the quantity was 30·2 per cent. and the value 6·4 per cent. better in raw sugar. In tea there was a slight increase in quantity, but the value remained stationary; while in coffee an increase of 83·6 per cent. in amount only brought 26·2 per cent. improvement in value. Wine increased 10·3 per cent. in quantity and 8·6 in value. In raw materials for textile manufactures, the weight of the cotton imports increased by 445,676 cwt. (18·8 per cent.), but the increase in value was only £93,383 (1·3 per cent.); the contribution of the United States was greater, but those of Egypt and India less. Flax, hemp and jute, all increased in quantity and to a greater or less extent in value, but raw silk fell off 48·2 per cent. in amount and 44·9 per cent. in value. In the exports, coal was less by only 173,024 tons (4·7 per cent.), but its value was reduced by £736,021 (24·5 per cent.). Iron and steel were 3·6 per cent. higher in quantity, but 9·9 less in value. In spite of an increase in locomotives, due to larger shipments to South Africa, machinery was worth nearly a quarter of a million less. In new ships sold to foreigners, there was, however, the large increase of £1,093,525. Cotton manufactures showed a satisfactory increase in amount (22·9 per cent.), as a result of larger shipments to China, Japan, India, and British South Africa, but the total increase, which amounted to 93,608,700 yards, was not accompanied by a proportionate increase in value, which was only greater by £609,536 or 13·5 per cent. Other cotton manufactures, as well as cotton yarn, showed decreases in value, though the latter rose 15·7 per cent. in quantity. In wool there was a slight increase of quantity, though the value was less, but woollen and worsted yarns and tissues were all reduced in quantity and to a still larger extent in value. Chemical manures were less, though the fall in the value was not so large as in the quantity, but soda-compounds improved 19·5 per cent. in amount and 14·2 per cent. in value. As will be seen from the following table the total volume of trade in 1901 was 0·7 per cent. less than in the preceding year:—

—	1900.	1901.	Increase or Decrease.
Imports	£ 523,075,163	£ 522,238,986	- 836,177 = 0·15 %
Exports — British and Irish produce	291,191,996	280,498,889	- 10,693,107 = 3·6 %
Exports — Foreign and Colonial merchandise	63,181,758	67,846,843	+ 4,665,085 = 7·3 %
Volume of Trade	877,448,917	870,584,718	- 6,864,199 = 0·7 %

An issue of £2,000,000 Local Loans Three per cent. Stock, resulted in applications for nearly 13 millions sterling, at prices varying from £99 (the minimum) to £100. 10s. Tenders at £100. 3s. received about 35 per cent. of the amounts applied for; those above allotment in full. The average price obtained was £100. 3s. 9d. A considerable amount of the stock is believed to have been taken on behalf of the Post Office Savings Bank.

According to Lloyd's ship-building returns, the number of vessels (excluding warships) launched during 1901 in the United Kingdom was 639, with a gross tonnage of 1,524,739; of these only 48 (tonnage 23,661 tons) were sailing ships. Of the steamers no less than 140 were over 4,000 tons (in 1892 only 37 reached that tonnage), and eight exceeded 10,000 tons. The total output of the world in 1901 (excluding warships) appears to have been about 2,617,000 tons, while the ships removed by being wrecked or broken up amounted to 746,000 tons. Hence the net increase of the world's mercantile tonnage was 1,871,000 tons. The number of warships launched in the United Kingdom was 41, with a total displacement of 211,969 tons, and it may be added that the amount of warship tonnage (330,000 tons) now under construction in this country is smaller than it has been since December, 1897. In other countries 85 war-vessels, of 454,000 tons displacement, were built in the course of the year. The largest output of tonnage in this country

was from Newcastle (292,989 tons); Glasgow followed with 274,606 tons, Sunderland with 268,069, Greenock with 163,816, Middlesbrough with 161,058, Hartlepool with 150,607, and Belfast with 149,705. As regards warship tonnage, Glasgow led with 60,200 tons, London was second with 30,815, and Belfast third with 26,700.

COLONIES.—The gold output from the Rand in December amounted to 52,897 oz. of fine gold, a very considerable increase over the figure for November, which was only 39,075 oz. For the eight months since May, when the first mines were allowed to resume work, the total was 238,991 oz., and much better results may be expected in the near future, as the number of stamps at work is being increased every week. The yield from Rhodesia is slowly increasing; in December it was 15,174 oz., against 14,502 oz. in November, and 9,463 oz. in December, 1900. In West Australia the gold exported and received at the Perth Mint, amounted to 177,165 oz., valued at £682,086, an increase of 27,834 oz., as compared with December, 1900. In last year West Australia produced seven tons more gold than in 1899, the figure for which, 1,643,973 oz., was hitherto the largest recorded. Fourteen years ago the yield was only 302 oz.. In New South Wales the yield for December was 18,094 oz., valued at £51,704, against 36,248 oz., valued at £125,001 in the same month of 1900, while the total for 1901, amounting to 270,724 oz., and worth £921,282, is considerably behind that of the preceding year, viz.: 345,650 oz., valued at £1,194,521. In Queensland the output for December was 73,300 oz., and for the year 816,600 oz. Canada reports a highly prosperous year. Her exports were worth \$196,000,000, or twice what they were valued at ten years ago, while her imports have grown in the same period from \$119,000,000 to \$190,000,000. In Australia the revenue of New South Wales for the last half of the year amounted to £5,102,893, showing a decrease of £2,033. South Australia fared worse, for there was a decrease of £224,193, the total being £1,085,752. On the other hand Victoria's revenue rose by £213,971 to £3,943,076. In Tasmania there was a falling off for the whole year of about £100,000. In New Zealand, for the nine months ending on December 31st, the revenue reached a total of £4,211,612, a gain of £181,000, as compared with the return for the same period of the preceding year. The Customs revenue at £1,606,353 was £35,085 better, the Land Tax yielded £56,383 more, the total being £296,509, while an increase of £103,975 brought the railway revenue up to £1,301,779.

Two Colonial loans were floated during the month. Natal issued £1,945,000 Three per cent. Consolidated Stock at 93, and the Cape offered £2,608,300 Three-and-a-Half per cent. Stock on the tender system, the minimum being fixed at 102. The average price obtained was £102. 3s. 6d., and tenders at £102. 2s. received about 28 per cent. of the amounts applied for, those above obtaining allotment in full.

The following table shows the variations which have occurred in certain Colonial Government securities during the past three months:—

	28th Nov.	30th Dec.	28th Jan.
Canada 3 per cent.	101 $\frac{1}{4}$ —101 $\frac{3}{4}$	101 $\frac{1}{4}$ —101 $\frac{3}{4}$	101 $\frac{1}{4}$ —101 $\frac{3}{4}$
Cape 3 per cent.	93 $\frac{1}{2}$ —94 $\frac{1}{2}$	95—95 $\frac{1}{2}$	94—94 $\frac{1}{2}$
Natal 3 per cent.	93 $\frac{1}{2}$ —94 $\frac{1}{2}$	94—95	93 $\frac{1}{2}$ —94 $\frac{1}{2}$
New S. Wales 3 per cent.	94—94 $\frac{1}{2}$	95 $\frac{1}{2}$ —96	95 $\frac{1}{2}$ —96 $\frac{1}{4}$
New Zealand 3 per cent.	93 $\frac{1}{2}$ —94 $\frac{1}{4}$	94 $\frac{1}{2}$ —95	94 $\frac{1}{2}$ —95
Queensland, 3 per cent.	93—93 $\frac{1}{2}$	93 $\frac{1}{2}$ —94 $\frac{1}{4}$	93 $\frac{1}{2}$ —94 $\frac{1}{4}$
South Australia 3 per cent.	92 $\frac{3}{4}$ —93 $\frac{1}{4}$	93 $\frac{1}{4}$ —93 $\frac{3}{4}$	93—93 $\frac{1}{2}$
Tasmania 3 $\frac{1}{2}$ per cent.	103 $\frac{1}{2}$ —104 $\frac{1}{2}$	103 $\frac{1}{2}$ —104 $\frac{1}{2}$	103 $\frac{1}{2}$ —104 $\frac{1}{2}$
Victoria 3 per cent.	95 $\frac{1}{4}$ —96 $\frac{1}{4}$	96 $\frac{1}{4}$ —96 $\frac{3}{4}$	96 $\frac{1}{2}$ —97
West Australia 3 per cent. (May—Nov.)	91 $\frac{1}{2}$ —92 $\frac{1}{2}$	92 $\frac{1}{2}$ —93 $\frac{1}{2}$	92 $\frac{1}{2}$ —93 $\frac{1}{2}$

INDIA.—The variations which have occurred in the securities of seven leading Indian railway companies are shown below:—

	29th Nov.	30th Dec.	29th Jan.
Bengal and North Western	129—133	127—131	130—134
Bengal-Nagpur Gua. 4 per cent.	105—109	106—110	105—109
Bombay, Baroda & Cent. India	170—175	171—176	155—165
Indian Midland 4 per cent.	106—110	106—110	104—108
Madras Grntd. 5 per cent.	138—143	134—138	136—140
South Indian 4 $\frac{1}{2}$ per cent. Deb.	138—143	136—141	137—142
Southern Mahratta 3 $\frac{1}{2}$ per cent.	107—111	107—111	106—109

FOREIGN COUNTRIES.—In the Russian Budget for 1902, the total expenditure is put down at 1,946,571,976 roubles, of which 1,775,913,481 roubles represent ordinary expenditure, and 170,658,495 roubles extraordinary. The revenue is estimated at 1,802,584,482 roubles—1,800,784,482 ordinary and 1,800,000 extraordinary—so that there is a deficit of 143,987,494 roubles. These figures, as compared with the Budget of 1901, show an increase in ordinary expenditure of 119,260,925 roubles, and in ordinary revenue of 70,688,476 roubles. A large part of this enlarged expenditure is accounted for by the estimates of the Ministry of Ways of Communication, which is spending 52 million roubles more than in 1901. The construction of new railway lines, together with the development of the traffic and the improvement of the equipment on those that already exist, necessitates a great increase in ordinary expenditure; and, moreover, the present Budget has, for the first time, to make provision for the working by the State of the Moscow-Yaroslav-Archangel line. The remainder of the increased expenditure is made up of an increased sum of 30 million roubles, required by the Ministry of Finance (though 12 millions of that is in connection with the spirit monopoly and is balanced by a corresponding increase in revenue), and by various small amounts required in other departments. The increase in the revenue is expected, as to 35 million roubles, from larger receipts from the railways; other sources of revenue which are calculated to yield more money are: Customs (8,800,000 roubles), Imperial forests (8,200,000 roubles), sugar trade (7 million roubles), taxes on commerce and industry (3,400,000 roubles), and post office (2,400,000 roubles). On the other hand, a decrease of 10 million roubles is anticipated in connection with some other departments. Of the extraordinary expenditure the greater part is also allocated to railway construction; thus nearly 16 million roubles are to be expended on the

Siberian railway in re-construction and other ways, while 150 millions are to be devoted to making other lines within the empire—for example, the Orenburg-Tashkent railway. The 144 million roubles necessary to balance this year's Budget will, as usual, be drawn from the ever-ready free resources of the Imperial Treasury. These, at the beginning of last year, amounted to nearly 105 million roubles, and in the course of the year they were augmented by various sums amounting to about 116 million roubles, as well as by the 127 millions raised by the four per cent. loan of last spring. On the other hand, they have been depleted by the sum of 106 millions, spent on the military operations in the Far East, in alleviating the distress caused by the famine, and in other ways. At the present time they are considered to amount to about 240 million roubles.

In the French revenue for last year there was a deficit of 167,000,000 francs as compared with 1900. Beer, wine, cider, perry and mead account for 126,000,000f., Customs duties for 41,000,000f., beet-root sugar for 23,000,000f., and death and transfer duties for 22,000,000f. On the other hand, there were increases of 40,000,000f. from spirits, 3,000,000f. from the tax on coupons and dividends, 5,000,000f. from the stamp duty on bonds, and 5,000,000f. from the stamp duty on mortgages. The French railway receipts for last year show a decline of 17,000,000f. in the Northern, 15,000,000f. in the Paris, Lyons and Mediterranean, 11,000,000f. in the Eastern, 8,000,000f. in the Western, and 4,000,000f. in the Orleans lines.

The German imports last year amounted to 44,304,857 tons (1,000 kilogrammes = 1 ton) against 44,911,799 in 1900, the value falling 75,975 marks. The exports increased by 271,241 tons to 2,909,648 tons, their value rising 6,806 marks. A new German Imperial 3 per cent. loan for 115 million marks, and a Prussian one for 185 million marks, were placed on the market last month. The subscriptions to the former amounted to something like 7,000 million marks.

Our usual table of exchanges follows:—

AGRICULTURAL RETROSPECT.

UNITED KINGDOM.—Dull and occasionally rainy weather, with short periods of frost, was experienced during January, and the autumn-sown crops are in the best possible condition. Grass lands presented an unusually luxuriant appearance for the first month of the year, cattle enjoying several days of green pasture in the open fields. Good progress has been made with tillage work, and in some places sowings of oats and barley have already begun. During 1901 the value of the imports into the United Kingdom of articles of food and drink and living animals for food amounted to £219,945,200, a proportion of 42 per cent. of the total imports of all kinds, and £5,002,264 more than the corresponding amount in the previous year. The value of living animals imported for food was £9,400,033, or £222,286 less than in 1900. Of cattle, North America sent us 98 per cent. of our total supplies, the United States supplying £7,293,942 worth, and Canada £1,497,472 worth. No cattle were received from the Argentine during 1901, our ports being closed against live stock from that country owing to the presence of foot and mouth disease in the valley of the Plate. The trade thus displaced has been acquired by the United States. Our imports of live sheep have substantially decreased during the last three years; £942,891 was the value of the imports in 1899, £610,125 in 1900 and £582,969 in 1901. This decrease, however, is more than compensated for in the increase of dead meat imported. The value of our imports of all dead meat has advanced from £36,149,891 in 1900 to £39,987,806 last year. Of our disbursements for fresh beef the United States received the largest share, namely, £6,761,587 out of £8,906,839. Australia received £378,701 and New Zealand £366,595. Our payments for imported fresh mutton in 1901 amounted to £6,597,780, of which New Zealand received £2,949,441 and Australia £952,511, or a total for Australasia of £3,901,952, as compared with £3,380,241 in 1900. To Argentina went the sum of £1,950,599, which is an increase of £261,521. Our bill for imported bacon went up last year by £1,816,207 to a total of £13,590,176. Out of this total £9,255,851 went to the United States, £3,234,456 to Denmark, and £921,509 to Canada. We continue to buy foreign eggs in ever-increasing numbers, and last year we paid £5,495,776 on that account. Russia, which became in 1899 our chief source of eggs, has maintained that position, Denmark, Germany, Belgium and France following in order. Canada sent us £255,766 worth of eggs. A decline is recorded, both in quantity and in value, in our imports of cheese, for which we paid last year £6,227,277 or £610,606 less than in 1900. The chief disbursements under the head of cheese were £3,697,780 to Canada, £1,274,061 to the United States, and £747,035 to Holland. Our imports of butter rose in quantity from 3,378,516 cwt. in 1900 to 3,702,810 cwt. in 1901, and in value from £17,450,435 to £19,297,005, the latter showing an increase of £1,846,570. A falling-off took place last year in our imports of butter from Victoria and

New South Wales, those States, as well as New Zealand, having sent considerable quantities of their output to South Africa. Canada has recovered the position amongst our sources of butter which the bad Canadian dairy season of 1900 altered, and the sum paid by us to the Dominion on this score was £1,008,002 in 1901. The first place in the English butter market was held last year by Denmark, which supplied £8,950,497 worth. France came second with £1,704,128, Russia and Holland very close up in the third and fourth places, with Canada, as above mentioned, fifth. With regard to our imports of wheat grain it is interesting to note that Australia and New Zealand are receiving an increased share of our vast expenditure on that commodity, our disbursements to those Colonies amounting last year to £2,287,507, whilst Canada received £2,216,049 for wheat and £628,611 for flour.

COLONIES.—The Imperial Department of Agriculture for the WEST INDIES was only formed a little over three years ago, but in that short period a great deal of time has been devoted to investigating the improvement of sugar canes. It is a curious fact that, although the sugar cane has been cultivated in tropical countries for centuries, it was only about a dozen years ago that the discovery was made that they produced seeds, and that the plants could be grown from these seeds—the universal mode of propagation having been by means of slips. This knowledge of the existence of seeds has greatly simplified the question of developing better and more fruitful canes, and the authorities are doing their best to select from amongst the seedlings particular varieties to suit the different kinds of soil and climatic conditions. A year ago (March, 1901, page 76) we gave a short account of the remarkable results of the experiments conducted in Barbados by Professor d'Albuquerque and Mr. Bovell during the 1900 season, when it was shown that the best cane was the seedling B 147, followed by B 208, the standard cane favoured by the planters, and known as White Transparent, being eighth in order of merit. Last season the experiments were continued on a similar plan, the competing plants being grown in ordinary plantations, not in botanic gardens, and every care being taken to treat all equally. Unfortunately, the weather was very unfavourable, and the general result was an early crop of canes; the growth of which had been checked, and which had been brought to premature ripeness; consequently the purity of the cane juice generally was much below the average, and the tonnage of canes, and richness and purity of juice, were markedly diminished in such late-growing varieties as B 147. It is not surprising then, that the results do not agree with those of the previous year, the first place being now taken by B 208, which is described as the best all-round cane on account of its ready germination, the general absence of disease, the yield of sugar, the great richness and purity of its juice, and the satisfactory results obtained in both black and red soils, plants, and ratoons. Its juice purity was high, and the yield of sucrose 7,330 lb. per acre. White Transparent occupied second place, with fair juice purity, and 7,176 lb. of sucrose per acre, but the percentage of rotten canes was rather high. B 147 came third, with low purity of juice, and 6,787 lb. of sucrose per acre. Several varieties gave such poor results that, after weeding them out, it is proposed to experiment this year with white transparent Jamaica cane, the Sealy seedling, B 147 and B 208, and with such other promising new canes and seedlings as may be introduced. While these experiments were being carried out at Barbados, similar ones were being conducted at ANTIGUA and ST. KITTS, all tending to prove the absolute necessity of discovering the best cane to suit local conditions of soil, the islands varying a good deal in character. At Antigua there were 14 varieties of canes and seedlings in competition, there being 12 plots of each variety. D 95 secured first place, with 8,158 lb. of sucrose per acre, Mt. Blanc coming second with 7,256 lb., and Naga B third with 7,134 lb. White Transparent was seventh on the list with 6,856 lb., and B 147 only 12th with 6,050 lb. Turning to the St. Kitts results, where 20 varieties were competing, we find that—as in Barbados—B 208 is at the top of the list, with 9,817 lb. of sucrose per acre, while Naga B comes next with 8,956 lb., followed by B 147 in the third place with 8,874 lb. On the other hand, Mt. Blanc declines to the 11th place with 7,631 lb., and White Transparent is still further down, occupying the 16th place with 6,207 lb. In both islands it will be seen that the yield of the standard cane is far below that of the best new seedlings. From these experiments it is hoped to secure several kinds of canes, hitherto untried in St. Kitts, which will give better yields than those at present under cultivation. Full details of the experiments and the results have just been published by the Department of Agriculture. The Imperial Commissioner urges the planter carefully to study the facts contained in these publications, and not to embark on the cultivation of new canes until he has fully satisfied himself that they are exactly suited to the circumstances of his district.

The results of the work of last season in the agricultural, live stock and dairying industries in MANITOBA have been given in a bulletin issued by the Provincial Department of Agriculture and Immigration at Winnipeg. With regard to the wheat crop the bulletin says that the average yield for the province is now given as 25.1 bushels per acre, and a total crop of 50,502,085 bushels. The acreage in crop was 2,011,835. The eastern district suffered most from too heavy straw, and heads only partly filled. The yield increased westward to the boundary of the province, and was particularly heavy in the north-western district. In the Rapid city district and westward, and along the line of the Manitoba and North Western railway, a wonderful crop, averaging 30 bushels to the acre, was garnered. "This fact, with the advent of the new railroad from Forrest westward, makes that district a most desirable place for settlement and investment." The oat crop, although on the whole a good crop, was not up to expectations in many districts. The total yield for the province was 27,796,588 bushels from an area sown of 689,951 acres, or 40.3 bushels per acre. The barley crop is generally reported as one of the best ever grown in the province; heavy yield and fine, plump berry. The province was specially free from any disastrous hailstorms. The total yield was 6,536,155 bushels from 191,009 acres in crop, or 34.2 bushels per acre. The season of 1901 was also the most successful in the history of the dairy industry of Manitoba. The increase of dairy butter production was 31 per cent. over that of the previous year, and the

average price having remained about the same, a corresponding increase appears in the value. The output of creamery butter made a phenomenal stride, an increase of 96 per cent. over last year being shown. The average price was about 1½ cent lower than in the previous season. The total production of dairy butter was 2,748,090 pounds, of the value of 395,540 dollars, or 14.04c. per pound; of creamery butter, 2,460,650 pounds, of the value of 442,424 dollars, or 17.98c. per pound. There was very little increase in the output of cheese, but the quality and make of cheese has greatly improved and fewer complaints were received. The total production in the province was 1,039,392 pounds, valued at 88,348 dollars, or 8.5c. per pound. The number of live stock includes 142,080 horses, 263,168 cattle, and 94,680 pigs.

INDIA.—The first forecast of the cotton crop in the North-Western Provinces and Oudh reports that a very large area—the largest since 1894—has been devoted to the cultivation of cotton this year. The apprehensions of serious injury from the drought of September were not realised. Where there was irrigation, the crop seems to have altogether escaped injury. The condition of the present crop is better than the plentiful crop of 1900–01 at the corresponding period, the average condition for the province being represented by the figure 86, 100 representing a normal crop. The estimated out-turn amounts to 266,430 bales of 400 lb. each, a yield of 73 lb. per acre, as compared with 68 lb. in the previous year. In the Central Provinces the area under cotton is estimated at 990,042 acres, or slightly below last year's area, but 49 per cent. above the decennial average. The out-turn is estimated at 152,620 bales of 400 lb. each, as compared with 184,087, the out-turn of the preceding year.

His Excellency the Governor of CEYLON, in his address at the opening of the Legislative Council, referred to the progress made in the cultivation of minor agricultural products. Cacao is doing well, and on most estates the canker has been largely eradicated. Cocoanuts, cinnamon, cardamons, and other smaller products, have been in a prosperous condition during the year. Of new products, rubber claims the first place. Exports of appreciable quantities have commenced, and the prices obtained have been most satisfactory. The latest market report contains the entry: "Best Para, 3s. 9d.; Ceylon, fine, Para sort, 4s. 1½d. per lb." This cultivation may now be considered established in the wet low-country districts. Camphor has continued to attract attention, and bids fair to prove a paying minor product for many parts of the south-west and the hills. Samples prepared from trees grown in the Botanic Gardens have lately been valued at 126s. per cwt. The yield of camphor from clippings of leaves and young twigs is about 1.2 per cent., and the preparation is cheap, so that in places where 16,000 lb. of clippings can be obtained from an acre in a year, there is little doubt that it will pay well. Of other minor or new products, tobacco continues to extend, also vanilla, pepper, cinchona, and tapioca; the roots of the last-named are, however, only used as yams, and not for the preparation of tapioca. Citronella oil is in a very depressed state, owing to over-production and to low prices, with new competition in unadulterated oil from Java.

FOREIGN COUNTRIES.—The report of the Committee on Food Preservatives contains an interesting account of a visit paid to DENMARK by Dr. Bulstrode and Mr. Huddart in connection with the business of the Committee. It is observed that Denmark is a country of co-operative dairy societies. The country has laid itself out to perfect its butter manufacture as a national industry, and local exhibitions held all over the State in furtherance of the butter trade are aided by the Government. No State aid is, however, afforded to small farmers in need of capital for outlay on their business, but money can be borrowed at a low rate of interest from local banks, some of which belong to large co-operative societies. The central creameries draw milk from an average radius of six miles, and the farmers (who are members of the society to whose creamery they send their produce) are paid according to the quantity and the quality of the milk sent in. Government inspectors are employed to take samples of separated milk on its way from the creamery to the farm for cattle food, in order to ascertain that the law, which requires that all milk used as food for cattle shall be duly pasteurised, has been carried out. The milk cattle are mostly of the red Danish breed, but in Jutland the local breed is well represented. They are tethered in the field by chains some 12 feet long. The cows are moved seven times a day gradually from one side of the field to the other; milking is performed at 4 a.m. and 4 p.m. The tails of the cows are cut in winter for cleanliness, and the coats of the cows are brushed twice a day. Each milker washes her hands before beginning to milk, and rinses them before milking each cow. She milks from eighteen to twenty cows, the milk being at once screened. The milk is again screened before passing over an 18-coil cooler, and is then placed in an ice-water tank till despatched. The milk is weighed before being sent off, and the cans are sealed. A farm at Sofiendal and the Hasley co-operative dairy were visited as being typical of the industry. One of the cow-houses at Sofiendal served for 112 cows, the heads of the cattle in each double row being four feet apart. The house was 45 feet wide, and each of its eight sections was 15 feet long and 12 feet high, sufficing for 14 cows, and giving each of them 580 cubic feet of air space. There were seven doors in the stable, and fifteen windows, all opening in part. The stable was quite in the open; floor, ceiling and walls are white-washed twice a year. Every two cows have one water-trough, which automatically fills but never over-flows. This is regarded as a safeguard against tuberculosis, such as would not be procured by a water supply common to the whole herd. In the Hasley Co-operative Dairy the milk of 1,200 cows is dealt with daily. The water supply is from a well sunk 62 feet into the chalk. No ice is used, cooling being effected by cold water only. All the milk on receipt passes through a strainer fixed over the weighing machine, and also through a centrifugal separator, each separator dealing with 3,600 lb. of milk per hour. The milk is then warmed to 40 deg. C. (104 deg. F.), the cream and the skimmed milk running by separate channels to different pasteurising plant. After pasteurising the cream is cooled down to 10–12 deg. C. (50–54 deg. F.) by means of a cold-water coil-cooler. The cream is again heated to 40 deg. C., and the butter starter, procured from the Copenhagen laboratory, is introduced. The cream then stands till next morning, when it is churned for half-an-hour. Each churn makes 180–200 lb. of butter in half-an-hour.

LABOUR RETROSPECT.

UNITED KINGDOM.—The preliminary figures published in the *Labour Gazette* testify to the check in industrial activity which, after continuous prosperity for five years, occurred at the beginning of 1901. The net effect of all the changes in wages recorded last year was a fall amounting on an average to 1s. 9d. per head of the 901,820 people affected. The decline was, however, entirely confined to the mining and metal trades; in fact, all the other trades showed a slight increase. It is reported with satisfaction that, in spite of all decreases, wages on the whole are higher than they were five years ago. The mining industry of Scotland showed the heaviest decrease of all; Northumberland and Durham yielded a net decrease of 22½ and 25 per cent. respectively, and South Wales 7½ per cent. The greatest increase took place in the building trade, where 36,162 workmen received an increase of 1s. 3¼d. per head per week. As to changes in the hours of labour, the net result showed a decrease of 2.09 hours per week in the working hours of the 24,749 workpeople affected. It should be remembered that the workmen's Saturday measure did not come into operation until the first Saturday of the present year. Regarding trade disputes in 1901, it appears that the number, both of disputes and of workpeople concerned in them, was less than in any of the years 1893–1900. However, the aggregate duration of the disputes was greater in 1901 than in either of the two preceding years, though considerably below the average of the years 1893–1900. Out of the 624 disputes which occurred, no less than 410, or about two-thirds of the whole, occurred in the mining, building, and metal trades, and, out of the grand total of 175,000 workpeople affected, 110,000 belonged to the mining industry. The number of days lost by miners through strikes and lock-outs was 1,875,000 in 1901, as compared with about half-a-million in each of the two preceding years. The clothing trades lost more by disputes in 1901 than in 1900, but considerably less than the annual average loss in 1893–1900. The transport and fishing group of trades was much affected by the Grimsby fishing dispute, and the figures for these trades are considerably above the average for the previous eight years. Regarding the causes of the stoppages, it is found that no less than 392 out of a total of 624 arose out of questions of remuneration. In all years this is the main ground of contention, but it is a significant sign of the change in the condition of the labour market that there has been a great proportionate increase in the disputes arising out of demands by the employers for a reduction in wages. As to the result of strikes, about 27 per cent. issued in favour of the workmen, 33 per cent. in favour of the employers, and 36 per cent. were compromised. The great majority were settled by direct negotiation.

Mr. Alfred Mosely's scheme for a commission of enquiry regarding the methods of commercial and industrial education has been widened in its scope. On account of the attention drawn of late to the attitude of labour towards capital in this country, Mr. Mosely has decided to establish a sister commission to investigate this important question in the United States of America. There the relationship between workman and employer is on a better footing than is the case here or on the Continent. The staff are more directly interested in the out-turn of the works where they are employed; in many cases some form of profit-sharing exists. The men are encouraged to make suggestions, and are given free access to the heads if they have any grievance to state. As a result, they are inclined to associate their interests with those of their employers. Seldom is any objection heard to the introduction of labour-saving machinery. The second, or labour commission, will consist of some twenty or thirty members, some of them belonging to trade unions connected with our most important industries, others employers or representatives of employers, and Mr. Mosely's hope is that all, having seen in America the material benefits of intelligent co-operation between employers and employed, will return to England and spread the light among their fellows who have not had the opportunity of seeing and hearing for themselves. There is no doubt of the justice of the outspoken comment of *The Times* that, speaking generally, these commissions will find that things go better in America, because everybody minds his own business. Employers do their own protection against tyranny, and also do their own conciliation to avert battles with powerful organizations fully capable of maintaining the just rights of workmen. The State does its part in collecting information of public utility and in seeing that the principles of individual liberty are maintained. Employers, however, must understand that they, and no others, must deal with the general questions. No law can do them much good until they help themselves in a manner at once vigorous, clear-sighted and just.

COLONIES.—The Deputy Minister of the Interior of CANADA is on a visit to the United Kingdom, in order to give attention to the rearrangement of the emigration work in the interests of the Dominion. It is well known that at present for every British emigrant who goes to Canada, about five go to the United States; and yet there is a brisk emigration out of the United States into the farming districts of Western Canada. It is this territory that the Canadian Government are so desirous of opening up, and the Canadian Minister points out that the vast territories included in the province of Manitoba and the North-West, offer by far the best and largest agricultural land open to settlement in Canada, possibly in the world. The magnificent crops of wheat and other cereals during the year 1901, and for a number of years previously, leave no doubt whatever as to the capabilities of the country, and notwithstanding the fact that the whole area under cultivation is less than 3,000,000 acres—perhaps not more than 1 per cent. of the area of the

territories, including the new district of Athabasca—the returns will be about 110,000,000 bushels. This is the production of possibly not more than 50,000 or 60,000 farmers, many of whom have only within the last three or four years settled in the country, and consequently, have not had an opportunity of bringing under cultivation all the land belonging to them. People of the United States who consider their personal interests first, are beginning to understand and appreciate the advantage offered for settlement in Western Canada, and upwards of 50,000 have within three or four years removed from the United States to Western Canada to engage in farming. It is hoped that under an active propaganda, the British emigrant will understand and appreciate the advantages that are offered to him in a country where he will continue to be under British institutions, and at the same time, without question, make more material progress than he could possibly make in any other country in the world.

With reference to the land settlement scheme for the ORANGE RIVER Colony, services of experts have been secured to ascertain localities suitable for fruit-growing, tobacco cultivation, etc. It is reported that 80,000 morgen of land in the Ficksburg district are being purchased by the Government, in addition to the 45,000 morgen which have already been bought in the Thaba N'chu district. New railway lines, projected or completed, will assist in opening up this promising agricultural district. The idea was to split up the land into blocks, each of which forms five or six holdings, and enable settlers to establish small communities and villages. The Government are also buying large tracts of land in the conquered district for the same purpose. Eighty of these farms have been allotted, and numerous applications are constantly coming in for others. In NATAL the scarcity of labour in the building trades is causing serious difficulties at Pietermaritzburg. It is stated that the military are employing labour at high wages, and thus denuding the market. The Government have been approached with a view to the removal of the restrictions on immigration. From the TRANSVAAL comes news of good progress: new industrial and commercial enterprises are being promoted, and work at the mines is steadily increasing, now that the native labour difficulties are being overcome. Recruiting for the Rand in the Portuguese territory of Mozambique has resulted satisfactorily, and the immediate despatch of 30,000 natives is announced.

INDIA.—The latest cabled reports state that prospects have improved, especially in the North-West Provinces, and prices are generally stationary. In Punjab and Rajputana the outlook is less serious than was anticipated, distress developing very slowly. In Gujarat relief has been extending rapidly, numbers having increased, mainly on works in Panch Mahals. The numbers in receipt of relief total 208,000, distributed as follows:—Bombay, 121,000; Native States, 26,000; Baroda, 35,000; Mysore, 1,000; Rajputana, 12,000; Punjab, 3,000; Ajmer Merwana, 4,000; Central India, 6,000.

FOREIGN COUNTRIES.—The United States Consul, in a report on the textile industries of GERMANY, gives an interesting comparison between labour conditions in that country and here. The tendency is for large factories to rapidly absorb small ones. It is difficult to average the rate of wages, owing to the manifold varieties of production, the different values placed on skilled and unskilled labour, and the employment of women and children. For example, in Silesia, the average rate of wages per capita amounts to \$117.81 per annum. This includes an increase in wages of 20 per cent. since 1887. It must be remembered, however, that in case of sickness labourers receive medicine and hospital nursing free of charge at the hands of the State. This wage rate would not apply to central and southern Germany, where conditions are materially better. In the cotton-spinning branch, Germany labours under greater difficulties than does England, Belgium, or Switzerland. The two first-named countries are situated nearer the base of imported raw material, while Germany must transport these necessities by rail some distance inland, thus increasing the cost of production. Switzerland is able to take advantage of cheap water-power, which Germany does not possess to a like degree. England also enjoys a class of highly-skilled labour, which seldom changes occupation. In Germany, especially in cotton-spinning, the class of labour employed is not so efficient, owing to frequent changes of employment. The task of educating labour up to a high degree of efficiency is difficult, and many generations are necessary to achieve that result. The English cotton-spinners have attained such a degree of skill and intelligence that for the most part no supervision is necessary. In Germany the presence of a technical overseer is indispensable.

In BELGIUM, parliamentary measures are proposed in order to check Sunday labour. If the Bill about to be introduced becomes law, work on Sunday will be optional, and can no longer be obligatory. The change will be gradual as, although many trades will avail themselves of the new measure, Sunday labour has been common for so long that such a radical alteration in habits is not likely to be adopted at once. No attempt will be made to interfere with the freedom of contract between those who find the extra day's work to their mutual interest.

Serious labour disturbances have again occurred in SPAIN. The metal workers of Barcelona struck for a nine-hours' day, and were joined by malcontents from most of the factories and workshops in the district. Much rioting and violence took place, and the assistance of both the civil guard and the military was necessary. The masters offered to receive the men back on a ten-hours' day basis, but threatened, if the strike continued, to transfer their works to another country.

SCIENTIFIC AND TECHNICAL DEPARTMENT OF THE IMPERIAL INSTITUTE.

THE WHEAT SOILS OF ROTHAMSTED STUDIED AS REGARDS THEIR PHOSPHORIC ACID AND POTASH.

Of all the elements which exist combined in the soil, there are three which are by far the most potent in producing heavy crops; these are phosphorus, potassium and nitrogen. These elements exist in the soil, not free, but combined in the form of various compounds, the phosphorus being combined in various phosphates, all of which contain the oxide of phosphorus P_2O_5 , often called phosphoric acid, and the potassium being combined in silicates and other compounds which contain the oxide of potassium, often called potash. Consequently, in discussing the richness of a soil, it is usual to reckon how much phosphoric acid, P_2O_5 , and potash, K_2O , it contains, although these are really present combined with other substances.

By making analyses of the soil, the total quantity of phosphoric acid and the total quantity of potash in it are found; thus the soil in one of the plots contained 0.120 per cent. of phosphoric acid, equivalent to 3,111 lb. in an acre of soil to the depth of 9 inches; but as the agents by which the plant supplies itself with food from the soil are far less drastic in their action than those which the analyst employs, the older analyses of soils leave a great deal to be desired as guides to the value of a soil as a crop producer and as to its manurial requirements. In consequence of this, the attention of chemists for some time past has been directed to devising solvent solutions which should give the desired information, namely, how much food immediately available for the plant there is in a given soil, and Dr. Bernard Dyer has introduced the use of a solution of citric acid containing one part of the acid in one hundred parts of water, and has found it a satisfactory agent for the purpose.

The magnificent agricultural experiment station of the late Sir John Lawes at Rothamsted, with its record of crops and manures extending over fifty years, afforded unique material and data for studying soil in its relation to crops and manures by means of the new solvent. This has been done by Dr. Dyer, and the results are published in the *Philosophical Transactions of the Royal Society of London*, 1901, Vol. 194, page 235, under the title—"A Chemical Study of the Phosphoric Acid and Potash Contents of the Wheat Soils of Broadbalk Field, Rothamsted."

The experimental plots had grown wheat year after year, and had received various manures, the same plot being treated year by year with the same manure. On examining the tables of analyses in conjunction with the history of the plots, it appears that the determinations of the total amounts of phosphoric acid and potash throw far less light on what has been going on than the determination of the amounts of those substances dissolved out of the soil by the use of the one per cent. citric acid solution, although these latter are much smaller quantities; consequently, in what follows, only the citric acid values will be referred to.

PHOSPHORIC ACID RESULTS.

Some of the numerous results relating to phosphoric acid are condensed in the following table:—

SOIL SAMPLES TAKEN IN 1893.

Plot.	Annual manuring for 50 years (with only minor variations during earlier years).	Percentage of phosphoric acid (P_2O_5) in fine dry soil, 1st 9 inches, dissolved by 1 per cent. citric acid solution.	The phosphoric acid (P_2O_5) expressed as lb. per acre.	Proportional amounts of phosphoric acid.	Average yield per acre, 1889-94.	
					Wheat.	Straw.
3	Unmanured continuously.	0.0078	202	1	bushels.	cwt.
10A	Manured with nitrogen only, in the form of ammonium salts, since 1844.	0.0074	192		13	9
7	Complete manuring with mineral substances: phosphorus in the form of superphosphate, nitrogen as ammonium salts, potassium, sodium and magnesium sulphates.	0.0547	1418	7.2	35	33½
11	Manured with nitrogen and phosphorus only, in the form of ammonium salts and superphosphate.	0.0405	1050	5.3	21½	20½
5	Manured with phosphorus as superphosphate and potassium, sodium and magnesium sulphates, but no nitrogen.	0.0642	1665	8.4	15	10½
2B	Manured with 14 tons per acre of farmyard manure. This contains nitrogen, phosphorus and potassium.	0.0560	1307	6.6	41	39

It should be noticed that in both the plots 3 and 10A, the crops were starving for want of available phosphorus. In plot 10A the stimulating action of nitrogen had produced heavier crops than plot 3, the unmanured one, yet considerably lower than in plot 11 where phosphorus had been supplied in addition to nitrogen. In plot 7 a very complete manuring, including phosphorus, nitrogen and potassium, had been supplied and the yield of wheat was double as great as that of plot 10A, being 35 bushels instead of 16½ bushels; whilst the yield of straw was more than double, being 33½ cwt. instead of 13½ cwt. Here the available phosphoric acid was 0.547 per cent. or 7.2 times as great as in the plots 3 and 10A, which had received no phosphorus. Plot 5 had received a manuring complete, except for the absence of nitrogen, and the crop, owing to nitrogen starvation, amounted to 15 bushels of wheat and 10½ cwt. of straw, only a trifle above the crops on the unmanured land. As the crops from this plot had been small, but little phosphorus had been removed in them, and this accounts for the accumulation of available phosphorus in the soil, which contained 8.4 times as

much as in plots 3 and 10A. In plot 2B the land had received heavy dressings of farmyard manure and consequently abundance of nitrogen, phosphorus and potassium and, in return, yielded heavy crops. Here the available phosphorus was 6.6 times that in plots 3 and 10A.

A very interesting question is:—what amount of available phosphoric acid is so small as to constitute phosphoric starvation. The author concludes that when a soil is found to contain as little as about 0.1 per cent. of phosphoric acid, soluble in a 1 per cent. solution of citric acid, it stands in immediate need of phosphatic manure. It is more difficult to decide at what point of richness in phosphoric acid the further supply of phosphatic manure is unnecessary; the author thinks that this limit lies somewhere below 0.4 per cent., probably at 0.3 per cent.

It must be remembered that these conclusions relate to cereals, and that for root crops, more especially turnips, the limits would probably be higher.

POTASH RESULTS.

In the case of potash, even more than in that of phosphoric acid, a knowledge of the total amount present in the soil is no clue as to the need or otherwise for potassic manures. The Broadbalk soil contains probably 15 tons of potash in an acre to a depth of 9 inches; but it is in a dormant form, forming a reserve stock for the distant future, and is only very gradually rendered available for plant use by the natural processes going on within the soil. Even with this great reserve of potash the soil is unable to furnish a sufficient annual supply to the wheat crop under a system of continuous cropping, unless restitution is made in the form of manure.

The following table gives a selection of some of the numerous results relating to potash:—

Plot.	Annual manuring for 50 years (with only minor variations during the earlier years).	Percentage of potash (K_2O) in fine dry soil, 1st 9 inches, dissolved by 1 per cent. citric acid solution.	The potash (K_2O) expressed as lb. per acre.	Proportional amounts of potash.	Average yield per acre, 1889-94.	
					Wheat.	Straw.
3	Unmanured continuously.	0.0032	83	1	bushels.	cwt.
10A	Manured with nitrogen only, in the form of ammonium salts, since 1844.	0.0032	83	1	13	9
11	Manured with nitrogen and phosphorus only, in the form of ammonium salts and superphosphate.	0.0032	83	1	16½	13½
13	Manured with nitrogen, phosphorus and potassium, in the form of ammonium salts, superphosphate and potassium sulphate.	0.0188	487	5.9	32½	32
7	Complete manuring, with mineral substances: phosphorus in the form of superphosphate, nitrogen as ammonium salts, potassium, sodium and magnesium sulphates.	0.0232	602	7.3	35	33½
5	Manured with phosphorus as superphosphate and potassium, sodium and magnesium sulphates, but no nitrogen.	0.0308	799	9.6	15	10½
2B	Manured with 14 tons per acre of farmyard manure. This contains nitrogen, phosphorus and potassium.	0.0384	896	11.0	41	39

From these results it appears that in plot 11, although it had been abundantly supplied with nitrogen and phosphorus, the readily available potash had evidently been largely exhausted and the yield of wheat, 21½ bushels, and of straw, 20½ cwt., was only about two-thirds of that of plot 13, which had received the same manuring except that potassium, in the form of potassium sulphate, had been added, and which yielded 32½ bushels of wheat and 32 cwt. of straw.

When potassium sulphate was applied, the amount of potash received by the plot was about 100 lb. per acre per annum, so the figures show that this manuring caused an accumulation of available potash in the soil. The potash added in the farmyard manure was about double the above amount, and in this plot, too, available potash accumulated.

As to the critical amount of potash which may be taken as showing that the soil does not need any special application of potassium salts, the author considers that when a soil contains as much as 0.1 per cent. of citric-acid-soluble potash, this point is reached, at any rate as regards cereals.

LEATHER FOR BOOKBINDING.

The interesting report of the Society of Arts' Committee on Leather for Bookbinding has already been reviewed in this JOURNAL (Vol. VII, p. 208), where a summary of the principal conclusions and recommendations will be found. The experimental work, which was necessitated by the enquiry, was entrusted to a small sub-committee of experts, consisting of Dr. J. Gordon Parker, Professor Procter and Mr. A. Seymour-Jones, who carried out a large number of experiments which yielded valuable information upon the subject under investigation. The results could, of necessity, only be briefly given in the report itself, but a detailed account of the work has now been furnished by Dr. Parker in a lecture at the Society of Arts (*Journ. Soc. Arts*, Vol. L, p. 25), and, as many of the points investigated are of extreme importance to leather manufacturers and bookbinders, they may be dealt with more fully than was previously possible.

It was definitely established to the satisfaction of the Committee that nearly all modern bookbinding leathers show a much greater tendency to decay than those used previous to 1830, and the inference was that this could only be due to modern methods of leather manufacture. A careful examination of a large number of these old bindings, which had proved so permanent, revealed the following facts:—(1) the leather was generally thicker than that at present used; (2) the fibres of the leather were in the natural condition, *i.e.*, running transversely to the surface, whereas in modern leather, owing to the stretching and tight setting-out of the skin, the fibres are distorted and run more parallel to the surface; (3) the

amount of tannin present was less than that found in more modern bookbinding leather; and (4) in most cases the old leathers, which had stood so well, were tanned with either sumach or oak-bark.

With reference to the first two points it needed no investigation to prove the superiority of the older over the modern practice. The splitting or paring down of the skins, often to such an extent that only the thin grain surface remains, cannot but diminish the durability, since it removes the toughest part of the leather, while the custom of drying many kinds of leather in a tightly-stretched condition is also inimical, as it destroys the elasticity and, by displacing the fibres, hastens the deterioration. The other two points, viz., the influence of different tanning agents and the extent to which the tanning was varied, were made the subjects of careful investigation, especially as in nearly every case in which a modern leather had stood well it was found to have been tanned with sumach. Sumach and oak-bark are still used for the preparation of the best classes of leather, but large numbers of skins are treated with other materials, such as quebracho, larch bark, gambier, and mimosa bark, while thousands of skins tanned with turwar bark are imported from India. The latter, which are known in the trade as Persian morocco, Persian sheep, and East Indian calf, are usually re-tanned with sumach in this country, and had been found to be the least durable of all modern bookbinding leathers. Comparative experiments were, therefore, made by tanning different skins, calf, goat, and sheep, with the tanning materials in common use, and then testing the leathers by exposing them for long periods to the action of light, heat, the combustion products of coal gas, etc., in imitation of the usual library conditions. In every case the most resistant leather was that tanned with sumach, followed in order of merit by myrobalans, chestnut extract, oakwood extract, oak bark, gambier, larch bark, quebracho, pistacia and tamarix; while the worst specimens were the East Indian skins tanned with turwar bark, especially those which had been re-tanned here with sumach. This latter practice was shown by a further series of experiments to diminish the life of the leather by about half, probably owing, as will be seen later, to the use of sulphuric acid in the process, but at the best these skins are almost worthless for bookbinding purposes. It was also found that in every case the leather which was lightly tanned was much more resistant than the corresponding piece which had been more heavily tanned in accordance with the present custom.

Another important point which demanded attention was the decay of modern calf, tanned with oak bark, and for the purpose of investigation several of these skins were obtained from librarians and bookbinders. It was found on examination that most of these contained free sulphuric acid, which had evidently been used to brighten the colour, in quantities varying from 0.2 to 0.8 per cent., and consequently a number of other skins perfectly free from acid were also obtained for comparison. Pieces of these leathers were subjected to the tests already mentioned, with the result that the specimens free from acid proved very satisfactory, whereas those which contained acid were very adversely affected, changing in colour to red-brown and becoming hard, brittle and easily abraded by friction. The practice of using sulphuric acid for brightening the colour of oak-tanned calf is quite recent and only became general twenty or thirty years ago. It has a wonderful effect in removing stains from the skins, in rendering the colour brighter and more uniform, so that the leather presents a much better appearance, but its use appears to be injurious. In these experiments it was again observed that the more heavily tanned skins were the least resistant.

The methods employed in dyeing and finishing the leather were next examined, in order to determine whether any of these were likely to be the cause of deterioration. It was conclusively proved that if acid had not been used in the dye-bath the leather was in no way affected by the exposure to the test conditions and, in fact, the finishing appeared to protect the surface; but, on the other hand, in those cases where an acid dye-bath was employed the leather showed signs of decay, becoming hard and brittle. In these last experiments five different kinds of skin were employed, viz., calf, sheep, goat, seal and pig, and of these the two first were most affected by the acid.

The examination of a large number of samples of different kinds of leather of English manufacture showed that the use of sulphuric acid, either for improving the colour or in the dyeing process, has become almost universal. Thus, Dr. Parker found that 36 out of 38 samples of morocco, 12 out of 18 samples of skivers, and 27 out of 32 samples of calf, contained free sulphuric acid, while this was also present in all the samples of Persian goat, Persian sheep and pig skin, numbering 18, 23 and 6 respectively, which were examined. The same condition was found in French and German bookbinding leathers; eight different samples of French Levant morocco were all found to contain a large quantity of free sulphuric acid, varying from 0.6 to 1.3 per cent., and of twelve samples of German origin, eleven contained acid, the maximum amount being 0.85 per cent. The large percentage of free acid remaining in the leather was rather surprising in view of the thorough rinsing to which the skins are finally subjected in the tannery, but experiments showed that it is practically impossible to completely remove the acid by simply washing in running water. A piece of Persian leather, containing one per cent. of sulphuric acid, was continuously washed for five days, and was then found to retain slightly over 0.2 per cent. It is therefore recommended that in those cases where it is absolutely necessary to use sulphuric acid, the skins should be washed with water containing sodium (or potassium) lactate or acetate, whereby the free acid can be completely neutralised without producing any objectionable effects.

The quality of the leather manufactured from skins imported in a preserved condition was also investigated. Many of these are preserved in salt and, on tanning, were found to yield a leather much weaker than the dried or fresh skins, especially in those cases where slight decomposition had occurred. Large numbers of sheep skins, pickled in a solution of salt and sulphuric acid, are exported from New Zealand and Australia, and the leather obtained from these was also very greatly inferior to that from unpickled skins.

The practices of the bookbinder also received attention, with the result that the methods employed for the production of sprinkled leathers, and the use of oxalic acid for brightening the colour, are condemned, as tending to the rapid deterioration of the leather. The various pastes employed were usually found to be harmless, but much damage is done to the leather by stretching it too tightly over the back of the book.

One other fact of interest was brought out by the enquiry, viz., the large extent to which ordinary sheep skin is got up in imitation of other leathers. Books were met with apparently bound in Levant morocco, hard grain morocco, straight grain morocco, pig skin, calf skin, crocodile and alligator leathers, and all of these on microscopic examination were proved to be common sheep skin which had been stamped with the special grains and markings of the different skins.

These results completely justify the findings of the Committee, and it is to be hoped that the attention which has been devoted to the question will result in a great improvement in the durability of the present bookbinding leathers.

THE MANUFACTURE OF VARNISH.

It is well known that oil varnishes are usually made by heating fossil resins, such as the "kauri" of New Zealand, until they melt, and stirring into the molten mass linseed oil heated to a temperature sufficiently high to ensure complete miscibility of the oil and resin. In such a process a great loss of volatile matter from the crude resin occurs, often to the extent of 40 or 50 per cent. by weight; this loss is not only uneconomical, but is a source of danger, since the material driven off by the heat is very inflammable. It has frequently been suggested that the mixture of oil and resin might be more satisfactorily made by heating the materials together under pressure, and a series of experiments of the kind has been made by

Mr. A. J. Smith, the results of which have been published in a recent number of the *Journal of the Society of Chemical Industry* (November 30, 1901). In these laboratory experiments, the resin, in a finely powdered and dried state, was mixed with oil and heated in a Jena glass tube at a pressure of about two atmospheres. Solution occurred in the case of *kauri* in about twenty minutes with the formation of a pale yellow varnish, which, owing to its large content of resin, required more turpentine than usual to thin it down to working condition. The author has successfully carried this process out in melters of ten gallon capacity, so that it appears to be workable under manufacturing conditions, but he gives no information regarding the qualities of the varnish so produced, and in particular of the permanence or otherwise of the material when applied to wood.

It may be mentioned here, as a point of considerable importance, that the brilliance of a varnish depends upon the non-crystalline character of the resins from which it is made, and the dull appearance which many cheap varnishes acquire after a time is due to the crystallising out of simple resin acids like abietic and pimaric acids, which are the chief constituents of such resins as colophony, but also occur to a smaller extent in the more valuable resins *kauri* and *anini*. When the latter are treated in open vessels, the simpler resin acids already referred to volatilise, leaving the really valuable constituents behind, which, when combined with oil, produce a satisfactory varnish. It is to be expected, therefore, that the pressure process as suggested by Smith will not furnish a varnish of the same high quality, as regards permanence, as the older process of melting in open vessels.

In the discussion which followed the reading of this paper, Dr. Lewkowitsch remarked upon the unsatisfactory state of chemical knowledge on the subject of resins, and the consequent difficulty of classifying them and ascertaining the purity of commercial specimens, in spite of the fact that the manufacture of varnish was carried out on a very large scale, and was a matter of great industrial importance to this country. There is no doubt that a thorough investigation of many of the natural resins would disclose new sources of material for the manufacture of the finer kinds of varnish, and bring to light methods of treating the poorer resins, so as to improve their varnishing properties; but the subject is such a difficult one that it is not likely to be taken up while so many more promising fields are open to chemical investigators.

MINERAL PRODUCTION IN INDIA.

There has recently been issued from the office of the Director-General of Statistics for India the annual report on the production of minerals in that country, which gives some interesting figures showing the extent to which the mineral wealth of India is at present exploited.

It appears that the average output of salt per annum is nearly 1,000,000 tons, derived from the salt mines of the Punjab, the lakes and wells in Rajputana and Upper Burma, and from sea water in Madras, Bombay, Sind, and Lower Burma.

In spite of the wide-spread production of salt in the country, considerable quantities are imported from Europe *via* Liverpool and Hamburg, the average import for the last five years having been 398,000 tons.

The production of saltpetre (nitre) has declined considerably since the development of the Stassfurt mines has enabled Germany to manufacture potassium nitrate from the Stassfurt minerals and Chili saltpetre (sodium nitrate), but there is still produced in India a considerable quantity, since 404,378 cwt. were exported from Calcutta annually during the period 1896-1901.

The most satisfactory progress is shown by coal-mining in India, to which attention has already on several occasions been drawn in this JOURNAL, the output having increased from 3,540,000 tons in 1895 to 6,118,000 tons in 1900. Indian coal is now being extensively used for industrial purposes, except in Bombay, which is too remote from the coalfields, and is still therefore dependent upon external sources for fuel.

The output of iron ores is still very small, and iron is so far only smelted in the Raniganj district of Bengal, where it occurs in close proximity to coal; in this neighbourhood 57,000 tons of iron were manufactured in 1900, the total production in India being 63,000 tons.

It does not appear to be possible to further develop the Indian iron industry on the present lines, and the smelting of this metal will probably only be successful when carried on with large capital on a sufficiently extensive scale to enable the smelters to secure advantageous transport and freight rates.

A considerable amount of gold is produced in Mysore, the output now exceeding 500,000 ounces per annum. Small quantities are also found in the Nizam's dominions, and in the rivers of Northern India, the total production for 1900 being 513,266 oz., valued at over two millions sterling.

Petroleum is worked in Burma and Assam, the former produced 37,000,000 gallons last year, and the latter 1,000,000 gallons. This output is, however, not sufficient to meet the total demand in India, and a further 72 million gallons were obtained from Russia and the United States.

The foregoing include the principal minerals worked in India, but mica, corundum, manganese ore and tinstone are also found and exported in small quantities, whilst considerable quantities of precious stones, in particular the *jade* and *rubies* of Upper Burma, are sent abroad.

THE MAGNETIC IRON SAND OF THE ST. LAWRENCE.

The deposits of magnetic iron sand occurring on north shore of the river St. Lawrence have been known from very early times, and were worked from 1867 to 1875 by the "Moisie Iron Co." This company bought large tracts of land in the vicinity of Moisie and built there eight bloomery furnaces. The ore was first concentrated by means of magnets supplied with sand from an endless table or travelling band, and reduced in the furnace by means of charcoal as fuel. The blooms produced were exported to the United States, but the increased duty imposed in 1875 caused the company to close their works, and since that time this ore has not been utilized.

The most important deposits occur at Natashquan, Moisie, and St. Jean. The deposit of St. John river extends from its mouth, six miles to the north-east. It is 2 to 10 inches in thickness, the richest part occurring at Point Noire, four miles from the river St. John. The Natashquan deposit extends from the mouth of river so-named eastward for about 20 miles, and there is in sight between low water mark and the timbered ground a strip of sand from 100 feet to 400 feet wide, with dunes ranging from 5 to 50 feet in height. The thickness of the deposit varies from one inch to two feet on level ground, and contains from 20 to 95 per cent. of iron sand, while the dunes would give from 40 to 60 per cent.

Mr. Obalski considers that these deposits have been formed by the disintegration of ferruginous rocks, such as anorthosites of the Laurentian series, by the seas of past geological periods which brought about a concentration of the product of disintegration according to density. The sand, besides magnetite, contains ilmenite, garnets and quartz, from which it can be almost completely separated by means of magnetic concentrators. The following analyses show the composition of this ore:—

	Moisie.	Natashquan.
	Raw.	Concentrated.
	per cent.	per cent.
Metallic iron	55.23	70.01
Silica	—	0.22
Sulphur	—	0.026
Phosphorus	—	0.030
Titanium	9.6	nil.
		0.420
		69.78
		0.321
		0.011
		0.015
		0.860

Mr. Obalski recommends the working of the sand by means of steam shovels feeding cylindrical driers, from whence the ore would be taken to electro-magnetic separators and then shipped. The motive power could be supplied by water-power in these regions; wood-fuel is abundant, or Nova Scotia coal could be landed there for \$3 a ton.

THE QUININE TREATMENT OF MALARIA.

Until quite recently it was generally believed that malarial fever in man was caused by the inhalation of foul air from swamps; but this theory is now untenable, since it is proved to be possible to produce the disease in a healthy person by inoculation with the blood taken from a malaria patient. The theory is accepted in medical circles that the disease is produced by the introduction into the blood of a specific germ or bacillus, and the peculiar liability of inhabitants of swampy districts to the disease is explained by the observation made by Ross and others, that the mosquitoes which occur in great numbers in such districts are "hosts" for the malaria germs. A person bitten by a mosquito infected with the germ will, therefore, be inoculated with malarial fever.

Various observers have lived in malarial districts in Italy, in mosquito-proof houses, without contracting the disease, conclusively proving the part played by these insects in the dissemination of malaria.

Professor Koch has recently suggested the use of quinine as a means of combating malaria, since he has observed that its judicious administration to malaria patients causes the disappearance of the specific bacillus from their blood. He has used quinine in this way for some years with successful results, and gives the following particulars of the dosage which he has found most suitable:—In ordinary cases 1 gram (15.432 grains) should be taken by adults for two days in succession with intervals of nine days, for a period of two or three months. In obstinate cases 1 gram should be given for three days with intervals of seven days; in cases of quartan malaria larger doses are required. Where the patient is averse to taking quinine the same dose should be subcutaneously injected.

The author gives many examples showing the effectiveness of his quinine treatment, a feature of the cases being the increasing rarity of relapses. He ascribes the great decrease of malaria in Europe to the use of quinine, in spite of the existence of swamps and mosquitoes, and gives the following instances from his experience:—

In the German army 30 years ago the cases amounted to 54.5 per thousand, whilst at the present time the rate is only 0.45 per thousand. At Spandau, a particularly unhealthy place, the garrison ratio was 664 cases per thousand, whilst it has now diminished to one per thousand; at Pola, the chief seaport of Istria, in 1860 there were 887 cases per thousand, while the latest returns show a fall of this ratio to 30 cases. In each of these examples the decrease is traceable to the use of quinine. A peculiar feature is shown at Pola, where the ratio in the army has decreased, whilst it has increased amongst the civilian population. This is considered to be due to the medical supervision and the prompt measures that can be taken in the garrison.

PLANTING AND NEW PRODUCTS IN ZANZIBAR.

The Zanzibar Annual Report, of Mr. R. N. Lync, Director of Agriculture, furnishes a few interesting notes on planting progress, etc., in that district. As a result of extensive experiments with Liberian and Arabian coffee plants, he recommends in future the adoption of the Arabian species. About 2,400 Liberian coffee plants were grown on $4\frac{1}{2}$ acres of land and produced an unusually good result; although they suffered to some extent from the attacks of snails; but this pest was checked by the application of lime and ashes round the base of each plant. The Arabian coffee was quite as successful and produced a much better berry, commanding a higher price.

Tea cultivation appears to be still in an experimental stage. The soil is highly suitable, but there is only sufficient land to grow tea for local requirements; at present 13 acres are under cultivation with tea plants reared from Cinghalese seed.

Cacao has been tried to some extent, and has proved a delicate plant to rear. It is liable to attacks from insects, and suffers considerably during periods of extreme heat and drought. The plants of *Pithecolobium saman* and the jak tree have been adopted as a permanent shade for the cacao. The *bois immortelle*, which is extensively used for that purpose in Ceylon and Trinidad, does not thrive satisfactorily and has been discarded. The hot, dry weather which affected the cacao was equally destructive to young Para rubber trees. It has also been noticed that low-lying moist ground was not suited to the cultivation of the latter.

Vanilla has proved successful, the plantations now containing over 3,000 vines in very good condition; some are shaded by "mbono" creeper, for the remainder the adjoining forests afford sufficient protection. Results show that the "mbono" is hardly sufficient, whilst the forest shade is, in certain cases, too dense.

Experiments have been made with the fibre of China grass (*Behmeria nivea*) on a small scale. Considerable attention has been paid to the production of "fine" cloves, which by their enhanced value easily repay the extra trouble entailed. It is important that the sending to market of large quantities of "fine" cloves (say 400 or 500 bales) should be avoided. The small parcels of 25 to 35 bales, i.e. 900 to 1,200 lbs. of "fine" cloves readily command 2d. per lb. more than the "fair" cloves, and the extra labour involved such as hand-picking, special drying, etc., is very slight.

The cocoanut trees in the Dunga plantation have not yielded well, the last year having been bad for all kinds of fruit.

GENERAL NOTES.

SUGAR-REFINING IN ENGLAND.

A paper on this subject, dealing especially with the improvements, both in processes and machinery, which have been introduced during the last twenty-five years, was read at a recent meeting in Glasgow of the local section of the Society of Chemical Industry, and is printed in the current number (November, 1901) of the official *Journal* of the Society.

The author, Mr. T. L. Patterson, F.I.C., describes and discusses with considerable detail methods for the decolourisation of brown sugar, the concentration of syrups in vacuum pans, and the regeneration of animal charcoal by processes which do not impair its decolourising qualities, and finally gives some account of the condition of this industry in England as compared with its position in 1875. The consumption of sugar in this country in 1875 was 860,000 tons, equivalent to 60 lb. per head of the population; in 1900 this amount had increased to 1,489,000 tons, equal to 81.2 lb. per person. During the same period the English output of refined sugar fell from 760,000 tons to 610,000 tons, while the import, chiefly of German and Austrian origin, increased from 100,000 to 950,000 tons, i.e., the import increased 81.5 per cent. while the home production decreased by 20 per cent.

During the same period the number of refineries in operation in this country has fallen from 42 to 11; thus in London 20 factories were open in 1875, while only two are now at work, in Liverpool the figures are respectively 9 and 3, and in Greenock 13 and 5. The reason for this decline is, of course, the operation of the bounty system in Germany, Austria, Belgium, and France, and it is only by continually improving the appearance of their sugar that British makers have been able to obtain the enhanced prices which enable them to make a profit in the face of such unfair competition.

ZEBU CATTLE IN TRINIDAD.

In 1879 a few young, pure-bred Zebu cattle were introduced into Trinidad, and reared on the Government farm, with the object of improving the stock available there; the manager, Mr. C. W. Meaden, has furnished a report on the herds that have resulted from that introduction. Sufficient time has now elapsed to enable comparison to be made of the utility of the imported cattle with that of the native breeds, with the result that the superiority of the imported animal has been clearly established. They are capable of long-continued exertions in general agricultural work and require but little attention. On the other hand, as the following analyses show, the Zebu cows give milk somewhat weaker than that of the native animal.

	Sp. Grav.	Solids (not fat).	Fat.	Ash.	Cream.
Zebu cow	1031.0	8.9	3.72	0.72	4.5
Milch cow	1027.7	9.09	4.55	0.75	7.0

This defect has, to some extent, been remedied by crossing native cows with the Zebu bulls.

The beef obtained from Zebu cattle is of high quality when the animals are fed for slaughtering. There is already a considerable demand for pure and half-breed cattle of this class in the island, and their production appears to be a profitable industry, the prices obtainable being from £50 to £100 each for bulls and £20 to £30 for heifers.

RAFFIA FIBRE.

This material is the well-known "bast" employed by gardeners for tying vines, flowers, and plants to supports. It is obtained from the raffia or rofia palm, indigenous to Madagascar, and growing to an almost unlimited extent in that island, which, at present, according to the *Indian Agriculturist* (November, 1901), enjoys a complete monopoly in the supply of this fibre.

The branches of this palm are of the usual character, and consist of a central stalk bearing from 80 to 100 long green leaves arranged in an imparipinnate manner. The individual leaves contain a central midrib, which the Malagasy utilize for the manufacture of baskets, and a lamina from which the outer skin can be peeled, leaving an inner layer that in turn can be readily removed, torn into strips and dried in the sun, when it becomes the "bast" of commerce.

It was at one time woven by the natives into a coarse kind of cloth, generally used for wrapping goods, but a somewhat finer variety is still used as clothing by certain coast tribes.

For export to Europe the material is collected into skeins, and these again into bales, like those in which raw cotton is imported. Its softness and tenacity make it almost indispensable to horticulturists, and so it always commands a good price in the European markets.

THE ALKALOIDS OF JABORANDI LEAVES.

A short account of recent work on the characterisation of the alkaloids of this drug has already appeared in this *JOURNAL* (Vol. VI., 294), when it was pointed out that the leaves now found in commerce, viz., those obtained from *Pilocarpus microphyllus*, contained *pilocarpine* and its isomeride *isopilocarpine*. Since that time further work, both in England and Germany, has made it possible to obtain some further insight into the constitution of the chief alkaloid pilocarpine, and has proved that the structure previously assigned to this substance by the French chemists, Hardy and Calmels, is inaccurate. The oxidation of the alkaloids furnishes ammonia methylamine and a series of complicated paraffinic acids, of which the lowest member has been obtained artificially and its exact constitution thereby determined (*Jowett, Journ. Chem. Soc., December, 1901*). The facts already ascertained do not seem to be in harmony with the view that pilocarpine is a comparatively simple pyridine derivative, as was formerly assumed. It is to be hoped that the investigation, which is still proceeding in England in the laboratories of a firm of alkaloid makers, will result eventually in the synthetic production of pilocarpine, and so reduce the price and ensure a constant supply of this alkaloid, which now finds a continuously increasing application in medicine.

THE INDIGO AND COTTON CROPS.

The general memorandum on the indigo crops of India shows a general decrease of the area under cultivation; this decline ranges from 11 per cent. in Bengal (last year the decrease was 20 per cent.), to 40 per cent. in the North-West Provinces. As the weather in Bengal has been consistently favourable, it is estimated that the out-turn will be 85 to 90 per cent. of a normal crop. In the North-West Provinces and Oudh circumstances have not been so favourable; the out-turn is variably estimated at from 50 to 85 per cent. of the normal.

In the Punjab the area under cultivation is about 86,000 acres, as against 115,700 acres last year; this decline is chiefly accounted for by a deficient supply of water. A slight increase is noticeable in Madras, the area being now 166,000 acres. In every district general complaint is made of the decrease in prices, which is causing many factories to close.

Reports on cotton crops show a decrease in the Punjab of 12 per cent. on the area sown last season, in the North-West Provinces the average is about the same, and in Behar an increase of 17 per cent. above the average is recorded. The exact state of the crops in other districts is not at present known.

THE MINERAL DEPOSITS OF PALESTINE.

This forms the subject of a communication to Kirchhoff's *Technische Blätter* from a German mining engineer in Palestine.

Valuable mineral deposits have recently been discovered on both sides of the Jordan and the Dead Sea, consisting mostly of phosphate, the most important ingredient of artificial manure; whilst investigation has shown that the bituminous chalk springs of Nebi Musa contain from thirty to forty per cent. of asphalt. These mineral deposits afford the necessary material for an important industry, but better means of communication are necessary to ensure their development. This may not be far distant, now that the Turkish Government is planning a continuation of the Jaffa-Jerusalem railroad.

Norwegian Wood Pulp.—Reporting upon the trade and commerce of Norway, the United States Consul-General Dundas states that the production of pulp, especially mechanical pulp, was not appreciably larger in 1900 than in the preceding year, owing to the scarcity of water, but prices were very high—on the average about 55s. per ton, compared with 28s. to 29s. in the summer of 1899, while as much as 65s. was paid for prompt delivery—and as the demand was very great, manufacturers were masters of the situation. But only about half of the production profited by the rise in prices, the rest having been sold in advance. As formerly, the United Kingdom was the largest customer, with Germany, France, Belgium, Spain, and others in order of precedence.

	1899.	1900.
The quantity exported was:—Dry	19,768 tons.	21,546 tons.
Wet	284,023 "	301,545 "
Of which from Christiania:—Dry	8,741 "	6,670 "
Wet	34,265 "	38,052 "

The same conditions applied to cellulose, or chemical pulp, added to which the high price of coal is said to have been felt in no small degree by those works dependent on its use, so that on the whole 1900 is characterised as only a fairly good year, some factories doing well, but others the reverse. The total export was 94,885 tons dry and 10,288 tons wet (of which 68,525 tons went to the United Kingdom), compared with 75,731 tons dry and 7,490 tons wet in 1899. The quantity exported through the port of Christiania was 31,403 tons dry and 3,948 tons wet in 1899. The foregoing figures include a little re-exported Swedish cellulose.

LECTURES AND PAPERS.

"PLANTERS AND PLANTING IN TROPICAL GREATER BRITAIN."

(By R. HEDGER WALLACE, Esq.).

SIR EDWARD NOEL-WALKER presided on the 2nd December at a lecture delivered at the Institute by Mr. R. HEDGER WALLACE, entitled "Planters and Planting in Tropical Greater Britain." The Chairman, in his introductory remarks, said that having served for many years in tropical portions of the Empire, he had had abundant opportunities of making friends with planters, in those parts of the world, and of becoming acquainted with tropical matters of various kinds. He should, therefore, listen with great interest to what Mr. Hedger Wallace would have to say, and trusted that the audience would at any rate learn something of the resources and industries of the tropical colonies. The subject was at the present time one of considerable importance as, owing to the keenness of the competition that now prevailed, the days had gone by when people could go to our colonies and confidently expect to make fortunes with little or no effort on their part. Mr. Hedger Wallace was well fitted to speak on the subject, as he had had practical experience in India and in Australia, where he had been employed as an expert by the Government. He had also travelled in many other parts of the Empire.

Emigrants from these shores who went abroad to earn their own living by means of agricultural pursuits might, said Mr. Hedger Wallace, be divided into two classes:—those going to countries where the climate was temperate and where they intended to permanently reside or become "settlers"; and planters: those going to tropical countries, who regarded themselves more or less as exiles, trusting some day to be able to return to their native land. Climate, of course, was the reason of this. The planter's work might lie in the unhealthy wet coast jungle land, or in the wet condensation forest uplands of the interior, or in the monsoonal area between the two. He was thus compelled, on account of climate, to place a premium on his health varying with the salubrity of the place to which he went. On the other hand, tropical regions, suitable for cultivation, were much more productive than similar areas in the temperate zones, so that a planter had a reasonable expectation of making money much faster than the settler.

A planter did not, as a rule, himself perform any of the actual manual work or labour; that was all done by hired native labour—negroes, peons, and coolies. His business was to control and direct this labour so that the cost of production might be economical and the out-turn profitable.

With many economic plants, and their products, the planter was responsible not only for the labour-force, the extension of the plantation, and for the growth of the plant, from the seed in the nursery until it was in full bearing in the plantation, but also for the manufactured product. The tea-planter, for example, was responsible for the growing of the plant, and for the harvesting and gathering of the produce, and also for all the details of its manufacture into the commodity to be retailed. The coffee-planter's duties were as extensive, and the sugar-cane-planter had also to take up one or two of the processes of manufacture and refining in addition to growing the crop.

This practice, however, was not universal; some planters, by a system of advances, got the plant, or crop, grown for them by natives and their responsibility, in such cases, did not lie so much with the growing crop as with the methods, or processes, of curing, extracting, or manufacturing it into the marketable commodity.

The qualifications desirable on the part of the prospective planter, as could be readily understood, were exceedingly varied. A young man might go out to an Assam tea-plantation and be successful, while if he had gone to a Nyassaland coffee plantation he might not have been regarded as at all a suitable assistant; the duties expected of him in the two places being very different. In Assam the workmen he would supervise would be, in their way, skilled and with long accumulated experience to rely on, and he would merely have to see that they did their work; while in Nyassaland, on the other hand, the young planter would have to teach his labourers how to do everything required of them—to make bricks, to build sheds, to do carpentering and iron work, to look after live-stock, etc., etc.—in fact, he would have to teach them their trade as well as supervise their work.

The managers of, and assistants on, plantations were generally drawn from the English middle-classes and were usually men of good education, although without specific training for their vocation. Men of the artisan class—such as gardeners—had been tried, but they had not appeared to have shown themselves possessed of any qualities that made them better fitted for the work than the young public-school man, in fact they did not do as well—possibly because so much of a planter's business consisted in managing and directing. Mr. Wallace was of opinion that planters would still continue to be drawn from the middle classes, although in future they would have to obtain some preliminary training for the work expected of them.

At present the system carried out was purely a form of apprenticeship. When a young man joined a plantation, his services were of no value. In time, as he worked out his first agreement, he began to pick up the rudiments of his calling, experience being his great master. In the present circumstances the character, ability and zeal of the manager, under whom he served as an assistant, were very important elements in influencing and establishing the future prospects of a young man. Anyone who had been among planters in the East or West Indies, and America, would have noticed how men from certain plantations were in demand, and others were passed over, owing simply to the reputation which the plantations and gardens had gained under the managers in charge.

What was very desirable, with a view to making planters more progressive, was that before leaving the old country they should get a general training for the work that lay before them. Under the present regime they were exceedingly conservative and perpetuated old systems, methods and processes, simply because these had been the ones learned by them when they had first began their planting life as junior assistants.

Throughout the lecture Mr. Hedger Wallace frequently referred to this point: the necessity of young planters receiving some sort of training before leaving home. The haphazard way in which parents sent their sons to the tropics, without troubling themselves to see that the young men were properly trained and equipped for the life that lay before them, was remarkable. Of course the embryo planter could not, in the United Kingdom, obtain the experience, as cultivator or manufacturer, which must underlie successful work, and which could only be gained from a knowledge of local conditions. But the views and opinions of those who had gained local experience, in various parts of the world, could be noted, formulated, and correlated, to form the groundwork of the *Principles of Commercial Crop Cultivation*; and the future planter, before leaving home, could then thoroughly study these details. He should also obtain a fair idea of commercial geography, some insight into office routine, a fair grasp of the principles of book-keeping, and if possible some knowledge of machinery in a mechanical workshop.

This last qualification was sometimes of the utmost importance, as, in some countries, the planter had to be his own engineer and mechanic; while in others, although he might only have to exercise supervision, yet he would have to accept full responsibility for the proper working of the machinery and appliances.

Before leaving England a young man should know how to take care of his health in a tropical country, where the climate and general conditions were so different to those at home. This question of the health of the white man in hot countries was, of course, now receiving a great deal of attention. The sudden change from a land of rain, fogs, east winds, and little sunshine, to a country where the sun's rays were vertical, the rain violent, and the mean temperature fully 20 degrees higher than at home, was apt to be trying even to those in

the best of health. People in this country often failed to appreciate the fact that there were local differences of climate within the tropics and to think of, say, India as a country of but one climate. In the tropics one could meet with hot, cold, and wet seasons. In some areas the temperature was so moist that there was no evaporation from the skin, and in others the air was so dry that no moisture remained on the skin. The conditions that affected climate in the tropics were distribution of land and water, nature of the soil and vegetation, and position in respect of elevation or depression.

The temperate zones were rapidly being filled up by the white races, but the richest and most productive portions of the earth were situated in the tropics, from whence were obtained: sugar-cane, tobacco, tea, coffee, indigo, cocoa, cinchona, cotton, jute, ground nuts, cocoanuts, drugs, dye-stuffs, rice, teak, mahogany and other woods. It had been estimated that about one-fourth of the whole British Trade was in tropical produce.

Although the settler possessed a great many advantages over the planter, still the life and work of a planter was not without its attractions to those who from early youth had been removed from the conditions that affected the artisan and labouring classes.

The power of management, direction, and control, appealed to the planter's class instincts. The life might be lonely and yet it could be made pleasant, provided the work was to a man's liking and he took care of his health. He might feel that he was exiled from old and familiar scenes and surroundings, yet, when he returned to them, the days of his sojourn abroad were, to the old planter, generally days of pleasant memory.

Mr. Hedger Wallace showed an excellent series of slides illustrating the methods of cultivation of a number of the chief economic products of the tropics, pointing out their main characteristics. Among others were views of: tea-planting in Assam, coffee-planting in Nyassaland, the tobacco and spice plantations of North Borneo, lime cultivation in Dominica, cocoa cultivation in Trinidad, and banana- and pine-growing in Jamaica.

Sir Edward Noel-Walker, in proposing a vote of thanks, said that he was glad to find himself in general agreement with what had been said in the lecture, especially with regard to the necessity of young men, who were going out to the colonies, understanding beforehand a little about the nature of their future employment. He was of opinion that a considerable change would shortly take place in the planting world, and that the effect of the present keen competition would be to bring about a separation of those various kinds of work now performed by the planter. For example, central factories would be established for the manufacture of sugar, and the cultivation of the cane would be left to smaller cultivators. This change would bring about a revolution in the present social standing of the planter, the tendency probably being to lower his position; on the other hand, however, the transference of the growing of the plant to smaller cultivators would benefit the artisan class. He also referred to the difficulties with which the planter had to contend, as compared with the settler, in regard to climate, recreation, transport and labour. The question of how to induce some of the coloured races to work still remained unanswered, although it had received considerable attention ever since the abolition of slavery some sixty years ago.

"THE MAROONS OF JAMAICA."

(By H. T. THOMAS, Esq.)

SIR HENRY NORMAN presided on the 9th December at a lecture given at the Institute by Mr. H. T. THOMAS, Inspector of the Jamaica Constabulary, entitled "The Maroons of Jamaica." In his introductory remarks the chairman said, for the information of those of the audience who were not acquainted with Mr. Thomas, or who had not been present at the lecture given by him at the Institute a few weeks before, that the lecturer had been for twenty-three years an officer in the Jamaica Constabulary, that he was now at the head of the constabulary in the parish, or county, of St. Mary, a district covering about 230 square miles, that he had travelled in various parts of the island, and that he had paid particular attention to this somewhat curious people.

Only as recently as 1898 a considerable amount of space had, said Mr. Thomas, been devoted in one or two of the London papers to particulars of a disturbance, the importance of which, however, had been much exaggerated, created by the Maroons in the neighbourhood of the town of Annotto Bay on the north-west coast of Jamaica. The impression then created in this country—which corresponded in some measure to that obtaining in the island itself—was that the Maroons were a separate and distinct race of people, inhabiting the inaccessible forest regions of the mountainous interior of the island, and more or less independent of British rule—an impression which in many respects was quite inaccurate.

When the Spaniards settled in Jamaica, on its discovery by Columbus in 1494, they found it inhabited by a tribe of Arawak Indians, people of a gentle, peaceable disposition, living exclusively in settlements on the coast or its immediate neighbourhood, and subsisting, almost entirely, on fish, eked out with two or three kinds of vegetables, of which the chief was the cassava.

These Indians the Spaniards either exterminated outright, or enslaved and put to agriculture. In order to escape these alternatives the best and strongest of the aborigines left their settlements on the sea-shore and took refuge in the mountains of the interior, which hitherto they had never dared to penetrate. As the settlement and cultivation of the island proceeded, these Arawaks died out or escaped to the woods, and the Spaniards provided against the increasing demand for labourers by importing negro slaves from the West Coast of Africa, the strongest and most resolute of whom, in their turn, likewise escaped to the woods and joined the fugitive remnant of the Arawaks, whose numbers were thus constantly augmented by the very pick of the negro slaves from the plantations. The two races intermingled, and physical traces of this fusion persisted in certain individuals and families to the present day, although all the original Arawaks must have disappeared at least two centuries ago, while the element of negro blood constantly increased year by year and now completely preponderated.

The hair of the Indian was long and straight, and his complexion of a coppery red, while the negro's hair was short, crisp, and tightly curled, and his complexion black. In some of the blue-blooded families of this mixed race, at the present day, the skin was of a distinctly coppery tinge, and the hair, much longer than that of the ordinary negro, presented the appearance of having been highly frizzed.

This mixed people, being entirely cut off from such influences of civilisation as might have trickled to them from the Spaniards, and having no resources of their own in that direction, remained in a condition of savagery; indeed, it was beyond all question that the lower and more degraded African element among them by degrees introduced the practice of cannibalism, which was indulged in by them up to comparatively recent times. Also the African form of superstition known as obeah became practically their religion, and was believed in by them now to a greater extent than by the ordinary negro population.

In the years 1635 to 1637 the negroes, taking advantage of the military operations against the Spanish and British, abandoned the plantations wholesale, and joined the fugitives in the mountains in such numbers that together they became a serious menace to the English themselves; and it was possible that some of the more ambitious among them, men who had probably held exalted rank among their own tribes in Africa, had visions of a negro king being established in Jamaica by driving into the sea both the opposing nationalities of whites who were then contending for the possession of the island.

Mr. Thomas here gave an interesting account of the measures adopted by Major-General Sedgwick, the first administrator of the island, appointed by Cromwell, and of his successor D'Oyley, in subduing this people. Their subjection, however, was far from complete, and

considerable numbers of them remained irreconcilable; and these, from time to time, were augmented by runaways from the slaves whom the British, in their turn, began to import for the purposes of settling and cultivating the country.

It was about this time that the name Maroons first began to be definitely applied to this mixed race—a word said to be derived from the French “*Maron*” used by the buccaneers to describe fugitive negroes. As time went on they increased in numbers and confidence to such an extent that they occasionally raided the outlying sugar-plantations; and as cultivation increased, and plantations began to be carried further into the interior, each planter’s house had to be constructed in such a way as to be proof against the attacks of the Maroons. Arms and ammunition were provided, and guards were always in readiness; in fact every house, many of which were still in existence, was a small fortification, and had massive stone walls, loop-holes for musketry, and, in some cases, underground passages and vaults as places of refuge in case of emergency.

Altogether this turbulent people had from time to time been the cause of a good deal of trouble in the island, and much blood and treasure had been expended in contending against them—notably in 1734 and 1738, and again in 1795. This latter outbreak had been caused, Mr. Thomas considered, by the Government of the island in 1738 treating the insurgents, after their surrender, as an independent people instead of incorporating them with the rest of the population. The Government had made a treaty with them granting them—at that time merely a gang of depraved, ignorant African savages—numerous privileges which were not possessed by the great bulk of their countrymen throughout the island. Their mental and moral status was, if anything, lower than that of the slaves on the plantations, and very much lower than that of the free coloured people of the island; and yet they were encouraged to keep themselves apart from, and regard themselves as superior to, all of these.

A detailed account was given of the insurrection of 1795, the most formidable outbreak that had disturbed Jamaica during its existence of 250 years as a British Colony, and which resulted in the Maroons offering their submission. This was accepted on the condition that they resettled in the island as ordinary free negroes. As only a portion of them agreed to this, a large number, about 600 in all, were, in 1796, deported to Nova Scotia, but being unable to stand the climate there they were eventually transhipped to Sierra Leone, where their descendants might still be found.

This exodus did not include every individual Maroon in the island. Small bands of them still lurked here and there in the woods, and any runaway slave who joined them became, by virtue of that act, a Maroon himself; but they do not seem to have given the Government any further considerable trouble, and in the serious rising of slaves, which occurred in 1832, there was no record of the Maroons having been engaged either on the side of the slaves or as allies of the Government.

Churches and schools were established in their settlements, and a large number gradually merged into the ordinary population while nominally maintaining their status as a distinct body. After emancipation many of them settled in the towns and other parts of the country and took up ordinary occupations. In all parts of the island, at the present day, were to be found men following different callings, some in the police force, who claimed to be of Maroon blood.

The last occasion the Maroons had acted, and been recognised, as a distinct and homogeneous body was in the year 1865, when they had been called upon to assist, and did assist, in the suppression of an incipient revolt. After the events of that year the Constitution of the island had been surrendered and the country became a Crown Colony, an era of reform had then been inaugurated, the country opened up by good roads, education taken in hand, the public service entirely reorganised, and altogether an entirely new order of things instituted.

Under these conditions the anomalous element of the Maroons, as a separate and semi-independent tribe distinct from the rest of the population, had gradually disappeared. They themselves had intermarried with the rest of the people, and only those who resided in settlements affected to keep up the traditions of the past by occasionally making a show of asserting their former privileges, by claiming exemption from taxes, and now and then laying a claim to lands which they alleged to have been devised to them by the Government in the past. It was a claim of this sort that had caused the disturbance referred to at the beginning of the lecture.

The Maroons relied on the mystery with which they had been surrounded in the past, and the traditional awe with which they were regarded by all classes of the population of Jamaica, to aid them to achieve their ends by means of bluff. Mr. Thomas was of opinion that if they were given clearly to understand that they were regarded in precisely the same light as any other of the negroes of the island they would never press any of these demands.

Any difference that existed between them and the rest of the negro population was, he said, entirely in favour of the latter. A great number of the men still followed their favourite pursuit of hog hunting and selling the “*jerked*” meat in the markets. Instead of carrying loads perched on the top of the head like the ordinary negro, they rested them on their backs suspended by a rope passed round the fore part of the head, a method which had obvious advantages when travelling through dense forests.

Mr. Thomas gave an interesting account of some journeys he had made to former Maroon strongholds, notably to Nannytown, a spot round which a considerable amount of superstition had arisen, and which, according to tradition, it was impossible for a white man to visit and return unharmed. He also described an expedition undertaken in 1890 by the then Governor, Sir Henry Blake, to a Maroon settlement, which he had conducted; and in conclusion said that the day of the Maroons had passed, and their capacity for mischief, which had always been their prominent characteristic, was practically at an end, and the time was not far distant when the name of Maroon would be nothing more than a tradition and a legend of the darkest days of Jamaica.

“EXPERIENCES IN ASIA MINOR IN 1857-8.”

(By GENERAL RENOUD JAMES.)

(ANGLO-RUSSIAN LITERARY SOCIETY.)

At a meeting of the Anglo-Russian Literary Society on December 3, Colonel Sir Thomas Holdich, K.C.I.E., C.B., R.E., in the chair, General Renoud James read an interesting paper on his “*Experiences in Asia Minor in 1857 and '58*,” while engaged there with the Turco-Russian Boundary Commission under the Command of Colonel Simmons (now Field-Marshal Sir John Linton Simmons), under whose orders were also Lieutenants Gordon and Helsham Jones, with Doctor Woodfall in medical charge.

General James at once aroused the interest of his audience by a delightful description of his friend and fellow-officer Gordon, the future hero of Khartoum, who had been his companion at Woolwich, before Sevastopol, and on the Bessarabia Frontier Commission, and with whom he had continued in intimate personal relations until 1859, corresponding with him afterwards almost until his sad death. The lecturer remembered with pleasure how, as a young man, Gordon had combined unwearied devotion to duty with extraordinary energy in every action of his life. By his bright, merry manner he brought everyone, with whom he came in contact, under the immediate influence of his own enthusiasm. No doubt the stern events of after-life divested his manner of this invariable cheerfulness, and changed him into the self-contained taciturn man, wrapt in religious contemplation, which he became in the world’s estimation. But General James felt thankful that he could treasure him in his memory as he had himself known him. As an instance of Gordon’s untiring energy, the lecturer said that often at the close of a hard day, when the officers with him would retire to their tents to rest, he would go out with his gun and not return till dusk. At Kazar Abad,

one halting-place on the frontier line of march, Gordon displayed his characteristic fearlessness by attacking a mountain bear with his sword. On another occasion he very nearly lost his life whilst descending Mount Alagos, when, in order to make the descent more rapidly, he was reckless enough to slide down the steep snow-covered side of the mountain. After these pleasant reminiscences of Gordon, General James proceeded to give an account of the journey from Constantinople to Trebizond, followed by the long march through Erzerum and Kars to the frontier at Alexandropol, where the whole Commission assembled. It consisted (besides the English party) of the French Commissioner, M. Pelissier, with his assistant, M. Saillard; Baron Finot, the French Consul in the Caucasus; the Turkish Commissioner, Hussein Pasha; the Russian Commissioners, General Tchirikoff and Colonel Nanine; a large detachment of Black Sea Cossacks under Colonel Kratchetefski, and two topographical officers. The lecturer then dealt in detail with the journeys made by the Commission along the frontier line southwards from Alexandropol to the Ararat range, and northwards from Alexandropol, through Georgia, to Batoum. In Georgia General James rode through some of the most beautiful scenery which he had ever seen. The desolate grandeur of the Ararat mountains had given place to the most lovely hills, valleys and lakes, resembling those in the highlands of Bavaria, while the wealth of forest—virgin oaks, ashes, and beeches—was beyond comparison. That the mountain tracks were very dangerous and difficult to travel on may be realised from the fact that, on one occasion, as the caravan was picking its way slowly along a precipitous mountain path, a mule, carrying a load of valuable surveying instruments, lost his footing, and fell into the bed of a torrent some hundreds of feet below.

After the description of a visit to the interesting town of Tiflis, and a thrilling account of a rapid and dangerous journey in canoes down the Teorahson to the Black Sea, General James concluded his interesting address by dwelling upon the great superiority of Russian over Turkish civilization in Asia. During his travels he had always preferred to be on the Russian side of the frontier. He believed that by this time the territory acquired by Russia in 1878 had advanced in every possible way. If it had remained in Turkish hands stagnation would have, as usual, been the result.

Colonel Helsham Jones, who had been a member of the Commission in 1857 and '58, spoke in high terms of Sir William Fenwick Williams and the officers who had so ably helped him in his defence of Kars; mentioning, also, the noble conduct of General Mouraviev on the surrender of the fortress.

Colonel Hamilton Vetch, C.B., and others, expressed their appreciation of the instructive paper just read. Mr. Cazalet said that he had travelled, in 1859, when the Russians captured the Circassian Chief Shanyl, through most of the places referred to by the lecturer. He also read a post-card written to him by General Gordon from Khartoum a year before his death.

Sir Thomas Holdich made some very interesting remarks with regard to Russia’s policy towards Turkey, and the Russo-Turkish boundary question, in the course of which he said that although he was not one of those who thought that England had everything to learn from foreign countries, and nothing to teach them—quite the contrary—he, nevertheless, thought that, in the matter of geographical surveying, we might take a lesson from Russia. For instance, we seemed to imagine that a few trained officers and untrained assistants were enough to cope with the whole area of South African mapping, and thus it was that we never seemed able to get our information till the critical time had arrived, and when it was most needed. Russia’s policy in this respect was very different.

PROCEEDINGS OF INSTITUTIONS.

THE LONDON CHAMBER OF COMMERCE.

At the third monthly dinner of the present session of this Chamber, held on the 15th ult., the subject for discussion was “*British Commercial Interests in Japan*.” Sir VINCENT KENNETT-BARRINGTON presided. In the course of the discussion Mr. J. H. LONGFORD, British Consul at Nagasaki, said that it had unfortunately been the custom in late years in England to overlook the great interest which we already had in Japan’s foreign trade, in the contemplation of the possible share which we might have in the future in a greatly developed trade with China. But that time was still remote. Japan’s foreign trade now exceeded in annual value £50,000,000. Her import of Western goods was over £19,000,000. Her imports from Great Britain exceeded £7,250,000, and from British dependencies, India, Hong Kong, and Australia, £3,750,000. So long ago as 1894 the two Japanese ports of Yokohama and Kobe had already become, next to Shanghai, incomparably the greatest seats of direct foreign trade, north of Hong Kong, in the Far East; and the imports in that year of the port of Kobe alone, which were very largely of British or British-Indian origin, exceeded in value the aggregate of those of the five principal ports in China, exclusive of Shanghai. The ratio of commercial progress between the countries had since been largely intensified. The commercial advance of Japan, the increase within the short space of ten years, not only in foreign trade, but in domestic industrial activity, had been no less marked than the display which she had given of her naval and military efficiency, and the fairest prospects existed that the results attained might be dwarfed into insignificance in the future. There was no likelihood of any diminution, either in the desire of her people to obtain from abroad what was becoming necessary to their comfort and well-being, or in their ability and willingness to pay for it. It was in manufactured goods that we in England were most interested. The import of woollen piece-goods, in which we found our principal competitor in Germany, would probably continue to increase. The home supply of cotton yarn, and, perhaps, also piece-goods, might become greater in Japan; but in all metal manufactures, in machinery of every description, especially spinning, weaving, printing, and sugar refining, in electrical appliances of all kinds, in locomotives, in all railway appliances, in all appliances necessary for the construction and maintenance of waterworks, in bridges, in steam boilers, steamers, sewing machines, pumps, fire-engines, and arms and munitions of war, he believed that, for very many years to come, there would be in Japan a steadily growing market well worthy of the most attentive cultivation in every respect. He could not now regard Germany’s competition, either in Japan or Corea, as a factor which need be viewed with any extravagant alarm by our manufacturers.

But very recently another rival had appeared on the scene, the United States; whose fiscal policy enabled the American manufacturer, who was geographically nearer to Japan and China than we were, to sell his goods to advantage at home, and thus console him for small profits or even occasional loss on the surplus sent abroad. American workmen were superior to our own in intelligence, ambition, education, mechanical ingenuity, energy, and desire to excel. Strikes were not unknown among them, but they were not heard of against the introduction of labour-saving machinery, which the American workman recognized must tend in the long run to his own betterment, while the manufacturer himself was bound by no rigidly conservative adherence to methods and traditions of the past or to established standards. He recognized that the seller must seek the buyer and meet his wishes, and that it was not the buyer who must take what the seller desired to provide. It used to be the custom to inscribe in large letters Nelson’s historic signal on the quarter-decks of all His Majesty’s battleships. That custom might now be imitated not only in every chamber of commerce in the United Kingdom, but in every factory and workshop, by inscribing prominently on their walls the Prince of Wales’s warning, “*The old country must wake up*.” Unless this were the case as regards both master and man, we should fail not only to advance, but even to maintain the position in Far Eastern trade which we still had.

As to the prospects of Japan as a market for the future, we could only judge by the history of the advance which she had made in the past, to which Mr. Longford proceeded to call

attention. He thought we might hope to hold our own with Germany, but, unless a radical change were made in our methods, he could not feel so sanguine with regard to the United States. Japan had herself evinced, and continued to evince, the strongest desire to cultivate closer commercial relations with us. She was now extending her consular system, and making many appointments of competent officers in our colonies with the avowed intention of fostering and extending trade. She was attached to us by strong political ties, and, what was more important in business, she recognized that everything we sold to her was of the best. An international exhibition, the first to be held, would be opened next year in Osaka, the Manchester of Japan. This would afford an opportunity which, he trusted, would be fully taken advantage of by our manufacturers to show their productions side by side with those of their rivals and to be represented during the continuance of the exhibition by qualified experts, who could, in the most favourable circumstances, investigate the prospects on the spot for themselves.

Mr. ARCHIBALD COLQUHOUN stated that during his wanderings in the Far East in the past twenty years he had made no fewer than five visits to Japan, and he had been struck on each occasion with the remarkable progress she had made. In many respects, embracing, indeed, almost everything of any real consequence, there was a complete identity of interests between Japan and this country, and recent events—the development, commercially and industrially, of Japan, and, still more, perhaps, the evolution, now proceeding in Japan, of her sea-power—had made that similarity still closer. He felt convinced that the Pacific Ocean was going to be the arena of the coming struggle of the 20th century. The struggle would not, he believed, be territorial in its chief features, but commercial and naval, and it would, he thought, centre about the great trade routes which already were beginning to revolutionize the whole history of the Pacific. In this coming struggle Japan must play no inconsiderable part, and must be our rival, but he believed we should find in her a friendly rival; and, in connection with it, he looked with entire confidence to a still closer bond between the two countries.

THE SOCIETY OF ARTS.

At a meeting of the Indian section of the Society, held on the 5th December, a paper was read by Mr. E. Penton on the new trade route to Persia by Nushki and Seistan. The chair was taken by Sir H. DRUMMOND WOLFE.

In the course of his paper Mr. Penton remarked that the trade of Persia had hitherto been controlled through three main entries—namely, through Caucasia and Transcaspia in the north, and through the Persian Gulf in the south. The two northern entries were entirely under the control of Russia, while England had always been a predominant Power in the Persian Gulf. If, however, the Eastern markets required English goods they had to be carried by caravan across the Dashtidut. This placed goods entering Persia from Askabad, which was only 150 miles from Meshed, in a predominant position in Khorassan, which had for centuries been one of the richest provinces of Persia. It was this country which the Nushki-Seistan route was to feed with Anglo-Indian goods. The Indian railways only reached as far as Quetta, from which place Nushki was 96 miles distant, and though the country between these two places had been surveyed, at present all caravans must start from Quetta in order to be in communication with the railway.

It was generally believed in India that the country between Nushki and Seistan was an absolute desert. The more correct description would be an unfertile country. The camel-grazing was excellent for the whole of the way, and only once did he reach a place where there was not sufficient scrub to make a fire. The journey in no way presented the difficulty it was generally supposed to present. Robat was the last British post, and the distance was accomplished in 18 marches—five to Dalbindin, three to Merui, and ten to Robat. As far as Dalbindin the water supply was excellent, and sweet water was obtainable on the present route to Merui. Between Nushki and Dalbindin mud bungalows were being erected at every stage, but from Dalbindin onwards accommodation could only be found in the thanas, or small forts, except at Merui and Robat, where bungalows were already built. From Robat to the Kuh-i-malik Siah, the point of junction of Baluchistan, Afghanistan, and Persia, was only half a march. The value of this post as a strategic position could not be over-estimated.

From Robat five marches brought the caravan to Pushtee Das, and from thence a difficult journey was made to Nasirabad, where a British Consulate was first established in January, 1899, by Colonel Trench. From Nasirabad the route lay to Birjand, from thence to Meshed. On this latter section the expedition passed through the most fertile country yet seen, villages full of orchards rich with fruit being passed on the way.

The bazaar at Meshed was found to be full of Russian goods, a fact which was not surprising, seeing that the distance between Meshed and Askabad, from which place there was direct communication with Europe, was only 150 miles. In addition to this advantage Russia gave large bounties to her subjects in Persia, which not only covered the cost of freight, but left a little profit for the merchant besides. The only British business interests were at present represented by a branch of the Imperial Bank of Persia, a wool buyer for a large firm; but he had every reason to believe we were rapidly gaining influence in the town.

With the institution of this route we had a channel through which our goods could pass with ease into Eastern Persia, and if we placed a firm foot at Robat we should be in a position to demand a share in any railway concessions in Persia that might be given to Russia, which would enable our trade to hold its own in that country. If, on the other hand, Russia were allowed to develop Persia alone, our position in the East would assuredly be in danger.

The Chairman, in opening a discussion which followed, said that all would agree that nothing would so conduce to the interest of the Indian Empire, and of the British Empire also, as the securing of constant peace in Persia. They saw great advances on the part of Russia in the markets of that country, and he only hoped we should be able to enter into harmonious relations with her so that there might be room for us as well in Persia as in Asia generally. He could not help thinking it would be futile on our part to endeavour to prevent other countries sharing in the trade of Persia. We should not oppose the making of railways in that country, but we should take care that we had a full share in their construction and in their control and management. Nothing was more desirable than to make Persia a bulwark, and he did not see why she should not become a sort of Oriental Belgium.

Sir T. Holdich, dealing with the suggested railway extension from Quetta to Nushki, said that Nushki formed a far more convenient terminus for traffic from the west, and the establishment of a line between Quetta and Nushki would deal with the most difficult section of the not very difficult line which would connect Quetta with Karachi in the south; and, if it so happened hereafter, as he thought it would, that England would see the advantages as well as the disadvantages of direct communication between the Khusk port and Herat, all the system of the south would work admirably into the connection.

Major Sykes said he had visited Seistan two years ago to found a Consulate, and he was much struck with the progress made since that time. He thought the Government of India was much to be congratulated on the progress made.

Sir Lepel Griffin thought that it should not be forgotten that, when Meshed was reached, an *impasse* was formed by the Russian frontier, which was only a very short distance to the north. The Russian tariff was so exclusive that it was very difficult for British goods to enter Russia at all, and he did not think there was a very large demand for them in that part of Persia referred to, as it was very thinly peopled. With regard to the question of opening routes into Persian territory, it must not be forgotten that our real entry into that country, and the real centre of British influence and trade, was the Persian Gulf. The preponderance of England in the Gulf had been the cardinal point of British policy during the whole of the last century. The Gulf was the key-note, so far as England was concerned, and it would be a great disadvantage to England if it was occupied by any one else.

COMMERCIAL INTELLIGENCE DEPARTMENT.

CORRESPONDENCE AND ENQUIRIES.

The following are given as specimens of some of the enquiries which have been addressed to, and satisfactorily answered by, the Institute during the past month (January).

** * All communications must be authenticated by the name and address of the writer. Enquiries which would involve special applications or expense will be a matter of arrangement with the correspondent.*

- J. C. C., London.—Lemon grass oil.
- R. S. P., Alnwick.—General information on Selangor.
- H. D., Huddersfield.—Briar pipe manufacturers.
- J. S., Edinburgh.—General information on Victoria, Queensland and New South Wales.
- Verbal.—Fruit cultivation in Jamaica.
- „ Import Duties of Bermuda.
- „ Kauri-pine wood.
- „ Customs Tariffs of Spain, Portugal, etc.

REQUIREMENTS REGISTRY.

In order to provide correspondents with an opportunity of making known special “wants” or “needs” in the British Colonies, India, and Foreign Countries, space will be regularly devoted to the publication of approved notices in the IMPERIAL INSTITUTE JOURNAL. Notices, as a rule, should not exceed 25 words in length, for which a charge of 2s. 6d. will be made for each insertion. Special arrangements can be made for longer notices.

SPECIMENS OF FOREIGN AND COLONIAL WOODS desired. Purchase or exchange. Names and localities must be well authenticated. Address—HERBERT STONE, BRACEBRIDGE-STREET, BIRMINGHAM.

THE CURATOR OF THE CANADIAN SECTION OF THE IMPERIAL INSTITUTE is prepared to furnish information about Canadian Trade and to supply names of importers, manufacturers, shippers, etc.

The following trade enquiries have been received at the Canadian Section of the Imperial Institute, from the Curator of which Section further particulars may be obtained:—

Home Enquiries.—A manufacturing company in a position to take considerable supplies of veneer which is impervious to moisture, would like to hear from Canadian firms which can furnish the material.

Enquiry is made for the names of Canadian manufacturers of wood flooring who are engaged in the export trade, and can quote upon specification.

A company manufacturing pumps and pumping machinery is prepared to appoint a responsible Canadian firm to act as its agents for the Dominion.

A Scotch firm desires names of Canadian producers of canned vegetables, fruits, etc.

A West of England firm seeks reliable Canadian agents to take up sale of stationery, novelties, guns, glues, window glass, etc.

A company manufacturing spring beds would like to hear from Canadian firms who can supply pitch pine frames for same in “knock-down condition.”

A broker and commission agent, possessing a good connection, is prepared to act as selling agent for first-class Canadian firm of packers wishing to develop export trade in canned goods.

An enquiry has been received from the north of England for the addresses of Canadian manufacturers of carriages, etc.

A London house wishes to be placed in communication with Canadian firms who can supply railway sleepers suitable to the requirements of tropical countries.

Canadian Enquiries.—A Montreal firm of importers and manufacturers whose travellers visit the principal centres, would like to secure the agency of a manufacturer of metallic capsules for bottles, etc., not already represented in Canada.

A British Columbia correspondent desires names of United Kingdom houses who can supply jam making machinery and appliances and glass jars.

A Canadian manufacturer of finished lasts of all kinds for the boot and shoe industry asks to be placed in communication with a United Kingdom firm of good standing prepared to do business in these classes of goods.

A Toronto firm of dry goods commission agents of ten years' standing seeks a few additional agencies in woollens, underwear, cottons, and similar goods.

MAPS AND CHARTS.—RECORDS.

[The entire collection of maps (with the exception of a few atlases and maps issued by private firms) consists of authoritative publications of the various government cartographical departments. Such as: the One-inch Ordnance Survey of Great Britain and Ireland, a complete set of Admiralty Charts, and a selection from the maps compiled in the Intelligence Division of the War Office; the monumental “Indian Atlas,” and a large number of the publications of the Surveyor-General's Office, Calcutta; the Geological Survey of Canada, and the Government Surveys of Victoria and New South Wales. In the arrangement of the collection, the geographical classification of the War Office Intelligence Department catalogue has, with some modifications, been followed.]

ADDITIONS TO THE COLLECTION OF MAPS DURING JANUARY, 1902.

AFRICA.

Egypt.

SUDAN. Sheets of Intelligence Division Map:—Atbara, Beni-Shangul, Fazogli, Keili, Shabluka and Shendi.

Presented by the Director-General of Mobilization and Military Intelligence.

CEYLON.

The annual Colonial Office report on the island of Ceylon shows that the revenue for 1900 amounted to Rs.27,325,930.56, compared with Rs.25,913,141.58 in 1899, showing an excess of Rs.1,412,788.98. The estimated revenue was exceeded by Rs.2,205,930.56. The revenue in 1850 amounted to about one-fourth of the receipts of the year 1900. The expenditure for 1900 was Rs.28,948,927.17, including Rs.3,626,939.17 on account of railway construction debited to surplus funds, and exceeded the expenditure of 1899 by Rs.3,997,986.81. The imports for the year were valued at Rs.114,544,256, as against Rs.101,542,220 in 1899, while the exports were valued at Rs.108,926,256, a decrease on the previous year, mainly attributed to the smaller shipments of plumbago. The export of tea increased by 20,000,000 lb., and reached 149,264,602 lb., valued at Rs.53,735,257. The shipping returns show a decrease of 1,335 in the number of vessels entered and cleared, but an increase of 1,048,735 in the tonnage.

The estimated population of the island on December 31, 1900, was 3,612,303. 136,051 births were registered and 100,873 deaths. The birth-rate was 38.2 against 38.0, and the death-rate 28.3 against 30.2 per 1,000 in the previous year, calculated on the estimated population at the middle of the year. Both birth and death rates show an improvement, and the estimated population exceeded that of 1899 by 123,000. Post office, telegraph, and savings bank business shows gratifying increases. The report refers to the participation of the colony in the South African war, and also gives particulars of the camps for the accommodation of 4,500 Boer prisoners.

Regarding openings for capital in Ceylon the report is somewhat pessimistic as to the plumbago and tea industries, but states that cocoanut cultivation is thriving, and that minor products, such as cacao and cardamons, are profitable. The last paragraph of the report deals with the social condition of the people, and draws attention to the small demands made on the Ceylon native's income in the way of taxes.

NEW BOOKS, etc.

CHARLES GRIFFIN AND CO., LIMITED. (London, 1901.) *Handbook on Petroleum for Inspectors under the Petroleum Acts.* By Captain J. H. THOMSON, H.M. Chief Inspector of Explosives, and ROBERTON REDWOOD, Adviser on Petroleum to the Home Office. La. 8vo., pp. xix + 298. (Price, 8s. 6d.) Mr. Robertson Redwood is well known as an expert on petroleum, and his exhaustive treatise on the subject is regarded as a standard authority. The present volume is intended for the use of inspectors under the Petroleum Acts, and also for those engaged in the petroleum trade as carriers, storers, or distributors, and those who employ petroleum in industrial operations or as a source of power. It contains information respecting the geographical and geological occurrence of petroleum, and its production and refining, which will be found most useful to those engaged in the trade, as well as to the local authorities. The numerous commercial products of petroleum, shale-oil and coal tar are described, as well as the flash-point, fire-test, etc. The past and existing legislation relating to petroleum is fully stated, the Acts and Forms of Licence in force being given in Appendices for convenience of reference. With a view to lessen the risks in handling and storing petroleum, the necessary precautions to be taken are clearly indicated, and if these safeguards were adopted, further legislative control would be unnecessary. Suggestions are also offered as to the construction and use of mineral oil lamps, which, if carried into effect, would render accidents from such lamps of rare occurrence. Though it is mentioned that this Handbook is in no sense official, yet the particulars it contains respecting the use of petroleum and of carbide of calcium and acetylene will be found most reliable and of the utmost value to all who are connected with these industries.

THE PROPRIETORS OF THE "IRON TRADE CIRCULAR (RYLAND'S)." (Birmingham, 1901.) *Ryland's List of Merchant Exporters*, being actual buyers of Iron, Steel, Tin-plates, Metals, Hardware, and Machinery, 1901. Fifth Edition. La. 8vo., pp. 197. (Price 10s. 6d.) This useful List has reached a fifth edition, and has been thoroughly tested by experienced persons connected with the iron, steel, tin-plate and hardware trades. It will be found invaluable to advertisers who make or supply the raw materials or who manufacture hardware. As a handy book of reference it can be well recommended.

The Imperial Colonist, edited by Lady KNIGHTLEY of FAWLEY, is a new publication issued by the BRITISH WOMEN'S EMIGRATION ASSOCIATION and the SOUTH AFRICAN EXPANSION COMMITTEE. It provides information as to openings in the Colonies for women as Teachers, Governesses, Trained Nurses, Mothers' Helps, Typists, Dressmakers, and Assistants in Business, and Domestic work; also particulars of Dairy-, Poultry-, Vegetable- and Fruit-Farming, or other business for those with small capital. The dates of sailings to the Colonies, cost of passage, etc., will be regularly announced. The *Journal* will be issued on the 1st of each month, at the small price of 2d., and it will be found most useful by British women who propose settling in any of the Colonies. It is probable that the information will soon be in considerable request, as emigration is rapidly increasing. Copies may be obtained at the British Women's Emigration Office, Imperial Institute. Annual Subscription 2s. 6d. post free.

CITY BRANCH OF THE IMPERIAL INSTITUTE, AT 112, CANNON STREET, LONDON, E.C.

The CITY BRANCH OF THE IMPERIAL INSTITUTE embraces:—

1. A News Room, supplied with:—

- The chief British Industrial and Commercial Periodicals;
- Many United States, German, and French Commercial Periodicals;
- Commercial Periodicals of the principal Colonies and of India;
- Market reports, prices-current, and statistics.

2. An Enquiry Office, in telephonic communication with the Commercial Information Office of the Imperial Institute at South Kensington. Enquiries relating to industrial, commercial, and other matters connected with the Colonies, India, and Foreign Countries, are received and promptly dealt with, and samples of products from the Colonies and India, stored at the Imperial Institute, can be inspected or obtained. Expert valuation will be furnished of samples submitted for that purpose.

3. The News Room is *free to Fellows* of the Institute, as is also the Enquiry Office for obtaining such information as does not involve special research or correspondence.

4. A *subscription* of the sum of one pound per annum, payable in advance, secures the *free use* of the News Room, and the supply, free of charge, of information not involving special research or correspondence.

5. Subscribers of one pound per annum are also entitled to inspect, *free of charge*, any maps or charts included in the Map Room collection at the Imperial Institute, South Kensington, and to consult any works, or official papers, included in the Institute Library. Passes admitting to the Library or the Map Room for the foregoing purposes will be issued, as required, on application to the Clerk at the City Office.

6. *Non-Subscribers* to the City Branch can be supplied with information upon the following terms:—

- First* enquiry, not involving special research or correspondence, *free*.
- For each subsequent enquiry, not involving special research or correspondence, one shilling.
- For each enquiry, involving special correspondence, or interviews with home-experts, etc., five shillings.
- For each enquiry involving Colonial or Foreign correspondence, ten shillings; or by special arrangement, if likely to be voluminous.

7. *Subscribers* will have to pay the charges specified under (c) and (d) in the foregoing clause: *Fellows* will only be required to reimburse the Institute any out-of-pocket expenses incurred in connection with enquiries coming under those heads.

8. The Information Department will undertake to obtain analytical or other examinations of samples by competent Experts, upon payment, by persons submitting them, of the usual professional fees, to be previously specified, and agreed to by the applicant.

9. The Institute will undertake to procure, and supply, at cost price, translations into any language, of trade circulars, prices-current, etc., and the conversion of weights, measures, coinages, etc.

SCHOOL OF MODERN ORIENTAL STUDIES.

Founded by the Imperial Institute in union with University College and King's College, London.

In 1887 it was suggested that a school of Modern Oriental Studies should be organised as a branch of the Institute, in imitation of the very efficient establishments of this kind which are carried on, with Government resources, in France, Germany, and Austria. The promulgation of this proposal led to negotiations with the authorities of University College and King's College, London, which resulted in their co-operation with the Institute in the establishment of the School. A Special Committee having been appointed to decide upon a system of work, it was arranged that classes for instruction in the Oriental languages required by students qualifying for examinations for the Indian Civil Service, should be held at University College, while modern Oriental languages, other than the Indian languages, should be taught at King's College, and that the Imperial Institute should undertake the general administrative and financial work. The School was officially opened in January, 1890, when an inaugural address was delivered by Professor Max Müller at the Royal Institution, in the presence of His Royal Highness the Prince of Wales. The daughters of the late Colonel W. J. Ouseley (Bengal Army) have established and endowed, in his memory, three scholarships, in Arabic, Persian, Hindustani, and other Oriental languages, in connection with the School, each one of the value of not less than £50 per annum. The following Scholarships have already been awarded:—

YEAR.	SUBJECT.	EXAMINERS.	AWARDED TO.
1892	Arabic .	{ Dr. WELLS Prof. SALMONÉ	<i>No Competitors.</i>
1893	Arabic .	{ Dr. WELLS Mr. JOHN T. PLATTS	Mr. HENRY LEITNER, junr.
"	Persian .	{ MIRZA HUSSEIN KULI KHAN Mr. JOHN T. PLATTS	Mr. E. DENISON ROSS.
1894	Hindustani .	Mr. JOHN T. PLATTS	<i>No Competitors.</i>
"	Persian .	Dr. ROBERT BRUCE	Mr. DIWÂN TEK CHAND.
"	Chinese .	Sir THOMAS WADE	<i>No Competitors.</i>
1895	Turkish .	Dr. WELLS	Mr. L. STENNETT AMERY.
"	Hindustani .	Mr. J. T. PLATTS	Mr. ASGHAR ALI.
"	Chinese .	Gen. R. D. ARDAGH	<i>No Competitors.</i>
1896	Burmese .	Dr. WELLS	Mr. LEE AH YAIN.
"	Arabic .	Mr. J. W. NEILL	Mr. H. G. SARWAR.
"	Marathi .	Dr. S. A. KAPADIA	Mr. V. R. PANDIT.
1897	Gujarati .	Mr. J. T. PLATTS	Mr. RUSTUM D. N. WADIA.
"	Persian .	Mr. W. A. PICKERING, C.M.G.	Mr. P. S. PATUCK.
"	Chinese .	Prof. J. F. BLUMHARDT	<i>No award.</i>
1898	Bengali .	Dr. WELLS	Mr. B. C. GHOSH.
"	Turkish .	Dr. WELLS	Lieut. A. M. SETON, R.A.
"	Chinese .	Dr. WELLS	<i>No Competitors.</i>
1899	Arabic .	Dr. WELLS	Mr. G. A. KHAN.
"	Persian .	Dr. ROSS	Mr. R. M. DAVIS.
"	Sanskrit .	Prof. C. BENDALL	Mr. S. K. GHOSE.
1900	Hindustani .	Mr. J. T. PLATTS	Mr. N. HAGOPIAN.
1901	Marathi .	Prof. J. W. NEILL	Mr. J. R. MARTIN.

An OUSELEY SCHOLARSHIP of £50, tenable for two years, will be awarded this year, should sufficient merit be shown, for proficiency in PERSIAN. *No person will be admitted to competition for a Scholarship in a language which is his own mother tongue, nor for a Scholarship in a language allied to his mother tongue.*

The examination takes place early in July, 1902.

Competitors must give notice on or before July 1, 1902.

The ages of Candidates are to be above 17 and under 25 years on January 1 of the year of examination.

Further particulars may be obtained from the Secretary, S.M.O.S., Imperial Institute, S.W.

GENERAL INFORMATION FOR INTENDING STUDENTS AT THE SCHOOL.

The classes which the "School of Modern Oriental Studies" comprises, are divided under two heads. DIVISION I. includes classes for all Oriental Languages especially required by Students qualifying for examinations for the Indian Civil Service, the instruction being of the same character as that provided for some time past at University College and at King's College. This Division includes instruction in Sanskrit, Bengali, Hindi, Hindustani, Tamil, Telugu, Punjabi, Pali, Marathi, Gujarati, Arabic, and Persian.

DIVISION II consists mainly of classes for Modern Oriental Languages other than the Indian Languages. The courses of tuition are of a practical rather than of an academic character; they have particular reference to commercial and official requirements and to the facilitation of colloquial intercourse with natives of Oriental Countries.

It is in contemplation, so soon as the number of students warrants the expenditure, to secure the services of native readers and teachers of conversation in connection with the classes of this Division.

The classes under this Division are conducted at King's College, where arrangements will also be made for the establishment of evening classes.

The Languages taught in Division II. comprise Colloquial Arabic, Armenian, Modern Greek, Colloquial, Persian, Russian, Turkish, Chinese, Burmese, Japanese, Malay, and Swahili.

Arrangements have been completed by the Managing Committee and approved of by the Governing Bodies of the Imperial Institute and of the two Colleges, for the pursuit of studies relating to the history, literature, commercial and physical geography, political economy, and the natural and industrial resources, of the countries and districts in which the various languages are used.

Special Lectures or courses of Lectures will be delivered from time to time, in connection with the School by experts or specialists, in any of the foregoing subjects.

There are three terms, of about ten weeks, in each year, as follows:—

SPRING TERM—commencing about the middle of January.

SUMMER TERM—commencing early in May.

AUTUMN TERM—commencing about the middle of October.

A fee of THREE GUINEAS per term will have to be paid, in advance, by each Student for each Language taken up for instruction. This payment will entitle the Student to the use, within the College, of text books, dictionaries, and works of reference required in connection with the particular Language taught, and to the use of all the facilities which it is proposed to secure in the development of the School.

Accommodation is provided at the Imperial Institute to enable Students to pursue their studies at hours when the classes are not held. The Libraries of both Colleges will be open to Students in any of the classes of the School, during the usual hours of study.

Intending Students should communicate with the Secretary at the offices of the Imperial Institute, London, S.W., where the registration of Students will take place, and where all information regarding the School will be supplied.

Balata in Dutch Guiana.—The balata industry in Dutch Guiana is flourishing, the revenues from concession fees for these have amounted to £800 in 1900. Not less than 14,820,000 acres were applied for the purpose of testing the presence of balata, and concessions have been granted for 395,200 acres. The growing request for this article, and the higher prices obtained in the market, are the reason for it. In time balata may take the place of caoutchouc in some manufactures. The chief export of balata goes to the United States and to Great Britain. Through the severe bye-laws prohibiting the felling of balata trees in Surinam, a decrease of the trees will very probably be prevented, although a control is very difficult. This is mostly done through journeys of policemen, especially in the district of Nickerie. On the 17th of January, 1901, the governor published the conditions according to which, in future, four month concessions for ascertaining the presence of balata will be granted free of charge. Its wording is as follows:—(a) No exploitation must take place; (b) The expeditions must consist of a foreman and six workers for every 123,500 acres, or part of it; (c) Within three weeks from the day of granting concession a certificate must be sent to the police at the Government-Secretary, that the persons named are engaged by contract, and one month after the granting of concession another certificate that the expedition is on its way; (d) The concession will at once be cancelled if the respective papers are not sent in properly in the time mentioned under (c); (e) If it is furthermore evident that the company does not carefully follow the conditions under (b) and (c), or tries to avoid them, if laws regarding public order, safety or health are not respected, or if an exploitation on a ground takes place that is only granted for trying. These conditions have been issued because, lately, exploitations took place repeatedly, when only a trial was allowed, and because often large areas have been allowed for trying without charge, when no trying has taken place at all. The reason for obtaining concessions in these cases was only to prevent others from getting concessions.—*The India Rubber and Gutta Percha Trades' Journal.*

MONTHLY COMMERCIAL AND INDUSTRIAL SUMMARIES.

GENERAL COMMERCE AND INDUSTRY. COLONIES.

Australia.—GLOVE TRADE.—The French Chamber of Commerce at Sydney calls attention to the vast consumption of gloves in Australia. The demand for gentlemen's gloves is but small, as large purchases are effected only of glacé and driving gloves, while of ladies' gloves great quantities are sold. The wearing of gloves is customary in all classes, including servants and workmen, and the heat in Australia causes gloves to become useless after having been worn several times, so that the consumption is very considerable. The best liked are four-button kid and suède gloves, which sell at 3s. to 4s. retail. Light shades sell best. There is a strong demand, especially during the summer, for white gloves at the retail price of 3s. 6d., but this article meets with the growing competition of the white silk glove at 1s. 6d. to 2s. the pair. New South Wales alone imported in 1899 gloves of the value of £89,855, the greatest portion of which was supplied *via* London. The total value of gloves imported annually into Australia probably exceeds £320,000.

British Columbia.—MINERAL PRODUCTION.—A bulletin issued by the Minister of Mines estimates the value of the mineral production of British Columbia in 1901 at \$20,713,501, being an increase of 25 per cent. over the previous year. The lode mines show an increase over 1900 of 57 per cent.

British East Africa.—OPENINGS FOR TRADE.—The British Sub-commissioner for the province of Ukamba, British East Africa, reports that with regard to the present system of trading there, nearly all the local trade—that is, any trade within four or five miles of the railway—is brought into the bazaars, but to places further afield caravans proceed as in the past. The principal goods required by the natives are as follows: Gray cloths, American and Gumpity; black and dark blue cloths, Kaniki; Turkey red, Bendera; flannel shirts, fez caps, umbrellas; cheap blankets, but must be wool; military and police coats, copper wire, brass wire and fancy beads. Locally, rupees and pice will purchase anything there is for sale. The money eventually finds its way into the bazaar, and the trade goods required or fancied by the natives are purchased. Nearly all the retail trade with the natives is in the hands of the East Indians and a few Greeks.

Canada.—MINERAL PRODUCTION.—The Dominion Statistician (Mr. George Johnston) has just completed a report, from which it appears that Canada's yield of minerals last year was only one-seventeenth of that of the United States, but this represented a value of \$12. 6c. per head of the population, compared with \$14. 3c. per head in the United States. Canada's increase per head in the decennial period 1891 to 1901 was a fraction short of double that of the United States, being \$8. 14c. per head, against \$4. 11c. per head for the United States; the Dominion Statistician remarks that it will not take long for Canada to catch up and pass the United States.

Gold represents the largest part of the increase in Canada. In 1891 the gold produced in the Dominion was only \$1,500,000, whereas last year it was \$27,908,000. In the United States the yield of gold last year was one-seventh of the entire metallic production, whilst in Canada it amounted to five-sevenths. Since Canada commenced producing gold she has added 136½ million dollars worth to the world's store of the yellow metal. Of this over 52 millions came from the Canadian Yukon gold-fields.

The metallic products of Canada chiefly comprise gold, silver, lead, nickel, copper, zinc, and pig iron; whilst in the United States, besides these, there are produced quicksilver, antimony, platinum, and aluminium, which do not appear in the Canadian returns. Antimony is found in one province of Canada, Nova Scotia, and was at one time produced to a small extent, but a lawsuit stopped operations. Aluminium, although not yet produced in Canada, exists in deposits to the extent of millions of tons. Canada also has corundum, but it is too valuable for its abrasive powers to be used to provide aluminium. The production of corundum is this year being undertaken in Canada on a somewhat extensive scale. Next to pig iron in importance in the United States is copper. The value of its copper output last year exceeded that of its gold by nineteen million dollars. In Canada the output of copper is trifling compared with that of the United States, only amounting to a little over three million dollars (\$3,063,119) last year, compared with upwards of 98 millions (\$98,494,039) in the United States. Copper mining companies are now in existence in Canada, however, having an authorised capital exceeding 140 million dollars, only a small proportion of which has so far been actually employed. Eight of these companies—namely, four in Ontario, two in Quebec, and one each in Nova Scotia and New Brunswick—are working mines of copper and pyrites; six companies, all in Ontario, copper and nickel; 32, in British Columbia, gold and copper. In nickel, Canada outstrips the United States and all other countries.

The non-metallic division of the mineral wealth of the United States and Canada comprises fuels, structural materials, abrasive materials, chemical materials, pigments, and what one may term "miscellaneous." The fuels include coal, natural gas, and petroleum. In these, as in the metallic division, Canada is gaining rapidly on the United States. The products of the latter country were 34 times greater than that of Canada in 1890, but fell to 27 times greater in 1900. The increase in that period in the United States was 75.9 per cent. and in Canada 120.7 per cent. In structural materials such as stone, tiles, clay for brick and cement, Canada's increase in the same period was 67 per cent., against 19 per cent. in the United States. Canada (Ontario), says Mr. Johnston, is unique in that it is the only maker of arsenic on the continent. Last year the Canadian Goldfields Company, Limited, produced 606,000 pounds of arsenic, of an estimated value of \$22,725, as a by-product of their gold-milling operations.

Straits Settlements.—COCOANUT AND ITS PRODUCTS.—During the calendar year 1900, there was imported into the Settlements 93,074,933½ lb. of copra, the import value of which was \$4,455,489 Mexican. During the same year there was exported 91,160,026½ lb. of copra, valued at \$4,416,937 Mexican. Of cocoanut oil, there was imported during 1900, 10,105,733½ lb., the import value of which was \$1,011,679 Mexican. The export was 14,749,553½ lb., the value of which was \$1,500,910 Mexican. Imports of cocoanuts amounted in 1900 to \$21,409 in Mexican currency, and the export to \$311,773 Mexican, showing a large local production. Of vegetable tallow, imports during the year 1900 amounted to 52,533½ lb., valued at \$7,034 Mexican, while exports amounted to 91,900 lb., valued at \$37,948 Mexican. About 60 per cent. of these imports came from Japan, and the remainder from Burma; all was exported to Great Britain.

Tasmania.—TIMBERS.—Tasmanian timber, admitted by experts as among the best in the world, finds but scant place in

the world's market. The *Tasmanian Mail*, therefore, welcomes a scheme which is likely to lead to development in trade in this product. From the evidence given before the select committee appointed to deal with the Geveeston Tramways and Timber Leases Bill, it appears that the proposal is to take up 26,000 acres of timber land lying beyond the town of Geveeston, in or near the valleys of the Kermadie and Arve rivers, and to utilise the timber growing thereon. With the aid of complete modern equipment, it is hoped to turn out 200,000 superficial feet of timber per week. The ports of the Commonwealth being open to the timber of this State, a demand for large quantities is expected from Victoria and Broken Hill, and it is further hoped that an increasing trade will be built up with the United Kingdom.

Uganda Railway.—CAPITAL AND REVENUE.—Sir George Taubman Goldie, in a letter to the *Times*, reviews this enterprise with respect to the manner in which the work has been done, and also in regard to its future. Answering the question whether there will be intrinsic value to show for the capital sum expended, he gives an unhesitating affirmative, his assertion being based on an inspection of the line throughout practically its entire length, and of the fully-equipped workshop, stores, and other accessories. It is probable that money might have been saved if time had been no object. Some of the temporary diversions, which have enabled material, labour, food, and water to be extended rapidly along the projected line would have been unnecessary. But the railway was not primarily a commercial speculation, and the public will not have forgotten the international situation up to 1899. The second question of interest is: how many years of loss or of mere covering of annual expenditure must be expected before the Treasury receives its first dividends. Sir G. T. Goldie feels no doubt as to the line ultimately proving a sound commercial speculation, but urges that the happy day may be hastened by a very moderate expenditure in assisting to develop the East African Protectorate. Its two needs are

IRRIGATION AND POPULATION.

For these we must look to paid Indian experience and assisted Indian immigration, excepting in that white man's country which the railway traverses between Kit, 267 miles, or, perhaps, Nairobi, 317 miles from Mombasa, and, roughly speaking, Fort Ternan, 542 miles. The breadth of this healthy zone in a bee line is, of course, considerably less—perhaps 160 miles in all; but it affords an ample field for settlers who are content not to make fortunes, but to provide prosperous livelihoods on the land for themselves and their descendants. It may be that Great Britain is no longer able to supply agricultural colonists of this stamp. The constantly accelerating migration from the country to the towns at home arouses reasonable doubt on this point. But if it is so, a useful lesson may be learnt from Argentina. Concessions of land in the white man's country may be granted on moderate terms to British resident capitalists, both great and small; and the manual labour can be supplied by Italian immigrants, who will remain, as in the regions of the Plate, for ten or twelve years, until they have amassed sufficient savings to enable them to live in comfort at home. Sir Charles Eliot, who has wisely devoted his first year of administration to constant travel throughout his extensive province, making himself acquainted with the wants and possibilities of the country, will certainly do all in his power to initiate and advance the development of his protectorate; but if Great Britain wishes for a harvest, she must undoubtedly lend the seed more liberally than heretofore, especially in view of the large province that the protectorate will take over from Uganda on March 31 next.

INDIA.

Demand for Machinery.—The *Indian Textile Journal* states that the demand for second-hand machinery is good. The bad financial straits in which many of the mills have to work preclude them from investing in new machines when they want one now and again. To some enterprising machinery merchant opening up a large showroom in Bombay the trade in second-hand machines would be found profitable. Such an establishment, conducted on well-organised lines, commanding an ample stock of machines, with prices within reasonable reach of the purchaser, ought to do well. There are some mills at the present moment badly in need of increasing their preparatory machinery, having room and power available for same, with a view to spin coarser counts on a larger scale than they could do at present.

Industrial Exhibitions in Calcutta.—Two industrial exhibitions have recently been held in Calcutta, the Mohan Mela having assembled for the eighteenth time, while the Indian Industrial Exhibition was held in the Beadon Garden in connection with the Indian Congress. The Mohan Mela exhibited works of purely Indian art, manufactured by Indian artisans. The noticeable exhibits were a Santipore hand loom preparing handkerchiefs of a fine texture, embossed with floral designs and names; a clock depicting scenes from the Mahabharata; a miniature locomotive engine and trucks plying on wooden rails; miniature steamships; clay models of Krishnagur representing faithful life-size figures; filigree work of Dacca in gold and silver, tastefully set with diamonds and pearls; a new device of a penny-in-the-slot machine turning out postcards. Besides this, ivory and sandal-wood work from the Punjab and Madras of exquisite skill; paintings on velvet from Jodhpore; and marble work of various designs from Jeypore were on view. Floricultural exhibits on a smaller scale were secured.

The Indian Industrial Exhibition was held for the first time. The exhibits were mainly articles sent by Indian firms, being both of European and Indian manufacture. Filigree work from Orissa, shellae and earthen models, automatic fountains and electric fans figured conspicuously among them. The fly-shuttle appliance for Indian handlooms, so much advocated by Mr. Havell, was on view, with a quantity of coarse fabric woven. The committee, consisting of native and European gentlemen, have succeeded in so far as to set many models for Indian enterprise. The exhibition of perfumery, medicine and drugs showed the extent to which the natives have developed the chemical industry, probably actuated by the visitation of epidemics.

FOREIGN COUNTRIES.

A New Dyestuff (Dye Sorrel).—The constantly increasing difficulty of obtaining the necessary tannic acid for the preparation of leather was mostly caused by the fact that the tanning stuffs formerly used have been extracted from the bark or fruit of trees. These grow slowly, and, in consequence, large tracts of land are necessary for obtaining the needed supplies. The endeavours to rectify these conditions, by using a quick-growing plant containing tannic acid, have been successful, through the discovery in the plains of Mexico and California of a sorrel (*Rumex hymenosepalus*) in the bulbs of which tannic acid exists. In a dried condition 35 per cent. of tannic acid is produced. As the wild plants were soon exhausted, plantations were commenced in 1896, and the large bulbs were used for tanning and the smaller ones for cultivating new plantations. The tannic acid is much increased by the plentiful use of water. The plants grow to the length of about a metre, and the leaves make an edible vegetable.—*Handels Museum*.

(It is interesting to note that the experimental cultivation of *Rumex hymenosepalus* was undertaken some years ago in New

South Wales, but no further development appears to have resulted.)

A New Textile Fabric.—The *Bolletino delle finanze* reports that some capitalists in Lombardy propose to make large plantations of zanzeviera in Erythraea, and also to build a spinning and weaving factory in Asmara. According to recent experiments, the new fabric is very useful for the manufacture of coarse goods, such as wagon cloths, and it is not unlikely that the zanzeviera fabric will compete seriously with the Manila hemp.

Brazil.—CONSULAR INVOICES.—The Austrian Consul in Curitiba reports that some firms in Curitiba were recently fined because the consular invoices gave no detailed description of the goods. It is to be particularly noticed that, in these Brazilian invoices, the weight of the goods, as well as the nature of them, must be very accurately specified. The fines are by no means small, and may even amount to three times the value of the goods.

Chinese Coal.—According to the *Straits Budget*, a coalfield of vast magnitude, giving fuel of a very high quality, will shortly be in full operation within a few hours' steam from Shanghai. It lies in the province of Anhui, quite close to the capital, Ngankin, which is situated on the Yangtse, less than a day's steaming from Shanghai. It is in the centre of an important carboniferous region, and foreigners have long known and often tried to get permission to tap the coal seams, which borings have shown to be extraordinarily rich and easily worked. The mines are to be worked by Japanese and Chinese capitalists.

Compressed Wood Casks.—The German Consul in Naples reports that a company has been formed in Bari for the manufacture of wooden casks by hydraulic pressure. The casks possess a cylindrical shape and are cheaper and more durable than the ordinary casks. On the other hand it is said that repairs will not be possible. The factory employs at present 80 workmen and produces 150 large casks daily. Up to the present, however, they are not much used in trade.—*Handels Museum*.

Japan.—EXPORT OF MATCHES.—During the last three years a decrease in the export of matches from Japan has taken place. For instance, the export from Kobé to China, Hong Kong and British India has fallen from six million yen in 1898 to 5.4 millions in 1900. The German Consul reports that this is caused by the bad quality of the Japanese matches, which is the cause of universal complaint. A fire on board of one of the Austrian mail steamers was attributed to a parcel of Japanese matches, which spontaneously ignited, and were without doubt the cause.

Japan.—SHIP-BUILDING.—The extraordinary progress in Japan of ship-building, which is strongly supported by the Government, has been shown by a report of the Yokohama Chamber of Commerce of November last. The United States Government has given an order to the Uraga Dock Company in Yokohama to build six gunboats for service in the Philippines. A representative of the above-named company went to Washington on the 24th October last, to settle details and terms of contract. The cost of one of these torpedo-boats is estimated at 0.15 to 0.20 million yens.

Trade between Russia and Japan.—The Odessa correspondent of the *Times* learns that an official of the Japanese Commercial Bureau has arrived in Russia with a commission from the Japanese Minister of Commerce, and will shortly visit Odessa for the purpose of supplementing the information already gathered by previous Japanese delegations in regard to the conditions and requirements of Russian markets and the possibility of establishing new markets in Russia for Japanese products. He will be accompanied on his visit to Odessa by a representative of the Russian Bureau of Commerce. One of the principal questions in view is that of establishing a direct service of steamers between Japanese and Black Sea ports. The negotiations are, it is stated, practically assured of success, in view of a promise given by the Japanese Minister of Commerce to accord material assistance to the new service, if established. The Russian authorities, on their side, are favourable, as the project should stimulate the export of many of Russia's products, such as sugar and kerosene. For the purpose of familiarizing Russian traders with the quality and variety of Japanese exports, commercial information bureaux are to be established in Moscow, Odessa, Warsaw, and other leading centres of trade in Russia, with the assistance of Russian commercial agents, to whom will be delegated the task of acquainting Russian producers and exporters with Japanese requirements.

United States.—MINISTRY OF COMMERCE.—For some time past the opinion has been gaining ground regarding the necessity for establishing a Ministry of Commerce for the United States, as is the case in most European countries. A Bill has passed the Senate creating a Department of Commerce and Labour, which is to unite the Consular department, or that portion of it which has to do with trade and commerce, the Government Statistical Bureau, and the Labour Bureau, into the Ministry of Commerce.

LABOUR MARKET.

UNITED KINGDOM.

British Merchant Service.—A Board of Trade Committee has been appointed to enquire into and report upon (1) The causes that have led to the employment of a large and increasing proportion of Lascars and foreigners in the British merchant service, and the effect of such employment upon the reserve of seamen of British nationality available for naval purposes in time of peace or war; (2) The sufficiency or otherwise of the existing law and practice for securing proper food, accommodation, medical attention, and reasonable conditions of comfort and well-being for seamen on British merchant ships; (3) The prevalence of desertion and other offences against discipline in the mercantile marine, and to make such recommendations with respect to these matters as they may think fit.

COLONIES.

The usual monthly report, compiled by the EMIGRANTS' INFORMATION OFFICE, states that there is no demand for more labour in Canada during the winter season, but several indoor trades—notably that of the tailors—have been very busy. Although the strike of miners at Rossland, British Columbia, has not formally been declared off, work has been for the most part resumed, and the supply of labour is quite sufficient.

Australia (New South Wales).—There have been disputes and strikes in the glass bottle trade, among tailoresses in the clothing trade, and at the Hillgrove mines; but they are now for the most part settled, a rise in wages having been conceded. Many persons at the Broken Hill silver mines complain of want of work: a reduction in the wages is contemplated, owing to the low price of lead. Reports state that at Mudgee there is a demand for farm and general labourers, female servants, carpenters, joiners, wheelwrights and engine drivers; that at Walgett "a few good steady men, able to turn their

hands to anything, could earn £3 a week," but that at Willcannia there is no demand for any kind of labour. (Victoria).—The Boards appointed under the Factories Act have determined that the lowest wages which may be paid to a copper-plate engraver shall be 80s. a week, of 48 hours, to male tailors' cutters and machinists in the clothing trade 7s. 6d. a day and to females 3s. 4d., to a harness maker or saddler 48s. per week for males (48 hours), and 20s. for females (45 hours). There is no demand at Melbourne for more mechanics. The carpenters at Melbourne have struck for a rise in their wages from 9s. to 10s. a day; the latter rate is already being paid to the more expert hands. Round Bendigo and in other country districts there is an opening for competent farmers and farm labourers. (Queensland).—The Report of the Government Labour Bureau for the quarter ending 30th September last, showed that there was a demand for a few mechanics at Charters Towers, Townsville, etc., but none elsewhere; that there was a good demand for agricultural labourers, and general labourers, especially in the South; that plantation hands were wanted in the districts of Bundaberg, Maryborough, etc.; that neither station hands nor miners were wanted anywhere; and that female servants were wanted in the North. (Western Australia).—Many of the carpenters at Fremantle, who are being paid less than the 12s. a day which others receive, have struck work. There is a good demand for farm labourers and female servants. There is no demand for miners, and very little for mechanics, unless they bring a little money, or are specially skilled.

New Zealand.—The building trades have been busy almost everywhere (but not at Wellington or Dunedin), and at Invercargill bricklayers have been in demand. The engineering trade is not giving full employment to men at Dunedin and Wellington; but elsewhere it is fairly good, and in Auckland blacksmithing and boiler-making have been brisk. The boot trade has been very good at Blenheim, and one or two other places, but very slack at Wellington and dull elsewhere. Both men and women in the clothing trades have been busy everywhere, and in Auckland, Dunedin and Invercargill there has been a scarcity of hands. Coal-miners have been busy at Westport. Unskilled labour has been for the most part well employed, but there is no demand for more, except in parts for dairyhands and milkers.

South Africa.—No one is now allowed to land in South Africa without a permit. This must be applied for at the Permit Office, 39, Victoria-street, London, S.W. The applicant must possess £100, or prove that he is in a position to maintain himself in South Africa. Applicants living within fifty miles of London must apply in person. These permits are no guarantee that the holders will be allowed to proceed inland. Only refugees, Government employees, and persons engaged in a service of a public nature will be permitted to proceed to the Transvaal. Candidates for the new South African Constabulary in the Transvaal and Orange River Colony should apply to The Recruiting Officer, S.A.C. Recruiting Office, King's-court, Broadway, Westminster, S.W.; they must be good riders, good shots, single, strictly sober, and from 20 to 35 years of age; they will be given free passages to South Africa. Farriers also are wanted for this force.

EMIGRATION AND IMMIGRATION.

* * *The Imperial Institute acts in concert with the Emigrants' Information Office (which is under the direction of the Colonial Office), of 31, Broadway, Westminster, S.W.; and also with the British Women's Emigration Association, now temporarily carrying on its work in rooms at the Institute. The Handbooks and Quarterly Circulars issued by the Emigrants' Information Office may be obtained at the Commercial Intelligence Office. Special information and practical advice respecting Canada and Cape Colony will also be furnished by the Curators of these Sections.*

UNITED KINGDOM.

General Emigration.—The number of passengers that left the United Kingdom for places out of Europe during 1901 was 302,848, being an increase of 4,287 over the previous year. Nearly two-thirds of the total—namely, 194,888—went to the United States, and 28,636 passengers went to South Africa, as against 25,518 in 1900. There was a set-back in the movement to Canada, the number of emigrants in 1901 being only 43,013, or nearly 7,000 less than in 1900. Of the total—302,848—only 172,140 were of British origin.

The hon. sec. of the British Women's Emigration Association reports 312 applications during the month ended January 21, from women of all classes, for information about their chances of employment in the colonies. In many cases some previous special training is recommended, that there may be sufficient proof of the suitability of these volunteers for useful service in some outlying portion of the Empire.

The County of Gloucester has inaugurated a special course of instruction for intending colonists, in its scheme of Technical Education. It includes Dairy work, Laundry, Cooking, etc., and all through the United Kingdom there are now opportunities within reach of almost every one, for acquiring some scientific knowledge of practical domestic and agricultural work. The number of travellers sent off through the Association in the past month is 26; eight went to Australia and New Zealand. A party of teachers for South Africa sent out by the Government for the Refugee Camps sailed on January 18th. Many applications continue to be received from employers in South Africa, or returning there, for servants, and these are carefully selected, generally by the employers themselves or their friends, from those whose applications and references have been investigated and approved by the Association. This seems to show that the article on "Female Emigration to South Africa" in a well-known monthly magazine does not accurately express the opinion and experience of ladies resident in the Cape Colony. The writer, after censuring both mistresses and servants, urges as a remedy that the former should close their doors to all imported assistance "until such times as they shall have made the people of the country realise the almost sacred nature of the bond between faithful attendants and grateful heads of households."—"That the importation of any form of individual talent testifies to the absence, in the new land immigrated to, of the peculiar qualifications in demand." "We should devote ourselves to training for domestic service some of our colonial girls—that we should use every argument in our power to remove the mistaken idea, which is taking such root in the colonies, that domestic service is degrading."

Earlier we read—of course it will take time, perhaps years; are the mistresses to be willing to wait to have their beds made and their dinners cooked until the Cape girls attain to the highest ideal of the dignity of domestic service?

Speaking further of lady colonists, it is admitted that assistance must be imported, and that they must not venture to marry until "from some corner of our world has been collected efficient paid assistance."

It is consoling to read the admission "that the higher class of servants are as reliable and as faithful abroad as at home."

COLONIES.

Farm Pupils in Canada.—In consequence of the agricultural prosperity in Canada, a number of agencies have sprung into existence in the United Kingdom which offer to secure situations on Canadian farms for young settlers, for which a premium is demanded. The High Commissioner announces that any young man possessing a sound constitution, and who is prepared to accept the conditions of farm life, can secure the opening he desires by giving his services in return for board and lodging as one of the farmer's family, together with a nominal wage for the first year. The circumstances are not such as to necessitate any payment as a premium. Assistance will be given to enquirers at the High Commissioner's office, Victoria-street, S.W.

In this connection a letter, written from Ottawa to the *Times*, is of interest. It clears away misconceptions which exist in England as to the necessity for "roughing it," under which would-be farmers in Canada are supposed to lie. Englishmen who know something of agricultural pursuits and have a little capital, can secure established farms in the eastern provinces at reasonable prices with little difficulty; and on such properties they will find farm buildings already standing, and be generally close to church, school, and railway. "In the strictly agricultural districts," the writer says, "the size of these farms is usually 100 or 150 acres each (two can sometimes be acquired together); in the fruit-raising parts of the Niagara peninsula the acreage is generally less and the price greater. The price of the class first mentioned is about £1,000 to £1,500, according to size, etc., and the bulk of the purchase money is nearly always payable by instalments, if the purchaser so desires. There is no 'roughing it' in a new country' about this. Nor is there any difficulty in finding such properties. An estate agent's books will supply a list to select from, and the inspection of those selected is no more difficult in an Ontario county than in an English shire."

CUSTOMS TARIFFS.

UNITED KINGDOM.

DRAWBACK REGULATIONS FOR SYRUP OR MOLASSES OF BRITISH MANUFACTURE.—The Board of Trade are in receipt of a notice which has recently been issued by order of the Commissioners of Customs with regard to the drawback allowed on the importation of syrups or molasses of British manufacture. The following is the text of the notice:—

"Subject to the conditions specified in the second Schedule to the Finance Act, 1901, the Board of Customs allow, on the exportation of syrups or molasses of British manufacture, drawback at the rates of import duty for molasses (1s., 2s., or 2s. 9d. per cwt.), according to the amount of sweetening matter contained in the article.

"Any claim for drawback, as to which the exporter may be able to prove that the amount allowable under the preceding paragraph is not equal to the duty paid in respect of the quantity of that article, which appears to the satisfaction of the Treasury to have been used in the manufacture or preparation of the goods, will be dealt with upon its merits; but a statutory declaration will be required in each case showing the quantity and description of the sugar or other article used in the manufacture, and the relative rate of duty paid upon importation.

"The Board of Customs, however, will, on application, be prepared to consider whether, and on what conditions, a statutory declaration in each instance may be dispensed with in the case of regular exporters of British manufactured syrups or molasses."

REGULATIONS WITH REGARD TO COAL SHIPPED UNDER PRE-BUDGET CONTRACTS.—The following notice has recently been issued by order of the Commissioners of Customs with regard to coal shipped under pre-Budget contracts:—

"With reference to Section 3 (2) of the Finance Act, 1901, which limits the concession in regard to pre-Budget coal contracts to coal exported before the 1st January, 1902, exporters of coal are hereby informed that duty must be paid on all coal liable to duty which has been shipped after midnight on the 31st December last.

"Shipments under accepted contracts, for which authorities for free shipments may have been given, are not exempt from this direction, notwithstanding that the coal covered by the authority may not have been all shipped by midnight on the 31st December.

"In order to insure that duty is paid on any balance that may be shipped after that hour on any such authority, shippers will have to enter into bond or make a deposit in cash, sufficient to cover payment of duty on such balance."

COLONIES.

British Honduras.—NEW EXPORT DUTIES.—The Board of Trade have received from the Governor of British Honduras a copy of an Ordinance (No. 20 of 1901), which repeals Ordinance 13 of 1899, and provides for the imposition of new duties on logwood and mahogany on export from the colony.

The export duties leviable have been fixed by an Order-in-Council, dated 5th December, 1901, and made under Section 1 of Ordinance 20 of 1901, as follows:—

Export Duty.	
Logwood	25 cents per ton.
Mahogany	75 " 1,000 sup. ft.

The duties previously in force were, on logwood, 50 cents per ton; and on mahogany, 1 dollar 50 cents per 1,000 sup. ft.

Ceylon.—EXPORTATION OF ARMS, ETC., MAY BE PROHIBITED.—Ordinance No. 12 of 1900, repealing Ordinance No. 7 of 1900, empowers the Governor to prohibit, by Proclamation published in the *Government Gazette*, the exportation from Ceylon of arms, ammunition, military and naval stores, and such articles as may be made useful for the purpose of increasing the quantity of arms, ammunition, etc.

Jamaica.—EXCISE DUTY ON MATCHES.—The "Match Excise Duty Law, 1901" (No. 12 of 1901), which was passed on 30th March, 1901, provides for the imposition of an Excise duty on matches manufactured in Jamaica, as follows:—

Excise Duty.	
Matches, per gross of boxes containing 50 sticks	
Or less per box	3d.

[And in proportion for boxes containing a greater number of sticks.]

Provision is also made for the payment by persons engaged in the business of manufacturing matches in the Island, of a licence duty of £1 per annum in respect of each manufactory.

Southern Rhodesia.—EXPORTATION OF WAR MATERIALS MAY BE PROHIBITED.—An Ordinance (No. 3 of 1901), promulgated on 22nd November last, empowers the Administrator to prohibit (by notice in the *Gazette*) the export or removal from Southern Rhodesia of any of the under-mentioned articles or things, being materials of war, except under permission

granted in writing given by himself or by some officer or person authorised by him to grant such permission:—

1. Guns and arms, comprising every weapon which can be used or employed in war of whatever kind, and the machinery for manufacturing the same.

2. Ammunition and explosives of all kinds, as also the ingredients used in their manufacture, and the machinery for manufacturing the same.

3. Military stores, comprising clothing, equipments, accoutrements, harness, saddlery, implements, and tools, wire, chemicals used in the manufacture of explosives, signalling and searchlight equipment, telegraphic and electric light plant suitable for field use, limelight apparatus, heliographs, optical instruments used in military operations.

4. Naval stores of all kinds, including, *inter alia*, materials used in ship construction, such as rivet iron, angle iron, round bars, rivets, sheet plate iron, forgings, and armour plates; marine engines and the component parts thereof, including screw propellers, paddle-wheels, cylinders, cranks, shafts, boilers, tubes for boilers, boiler-plates, fire-bars; every article, which is, or can become, applicable for the manufacture of marine machinery; anchors, chain cables, wire hawsers, capstans, windlasses, steam winches, masts, derricks, davits; torpedoes and their component parts, and machinery for manufacturing them; all apparatus for projecting inflammable materials or firing torpedoes; steam and other boats suitable for use for warlike purposes; submarine cables, submarine mines and apparatus appertaining to them; Marconi apparatus; electrical fittings used on board ship.

Transvaal.—CUSTOMS LAW.—A proclamation relating to the importation of goods into this colony provides that the duties on goods consigned to other places than Pretoria and Johannesburg shall be payable at the colonial ports of entry, and that duties on goods consigned to these towns shall be payable on delivery. The Customs law of the late South African Republic remains in force.

INDIA.

Merchandise Marks Act.—DECISION RESPECTING CIGARS.—Customs Circular (No. 17 of 1901), dated 29th November, 1901, refers to the indication of the country of origin of cigars on importation into India, as required by the Merchandise Marks Act, 4 of 1889. The Government of India have given their decision and are of opinion that "the use of words of a particular language on the paper bands round cigars shall not be regarded as a 'false trade description,' so long as the country of manufacture is clearly indicated on the box containing the cigars, and so long as the bands themselves are not stamped with a counterfeit trade mark."

FOREIGN COUNTRIES.

Belgium.—IMPORT DUTIES ON ACETIC AND SULPHURIC ETHER.—The Board of Trade have received a copy of a Belgian Royal Decree, fixing the import duties on sulphuric ether at 5 francs per 100 kilograms, and on acetic ether at 8 francs per 100 kilograms.

Germany-Samoa.—INTRODUCTION OF GERMAN MONETARY SYSTEM INTO SAMOA.—The Board of Trade have received copies and translations of two Ordinances of the Imperial Governor of Samoa affecting the monetary system and tariff of that country.

The first of these Ordinances decreed that on and after the 1st July last the German Imperial standard of coinage should take effect in the Protectorate of Samoa. British sovereigns and half-sovereigns, however, are to be legal tender, and the rate of exchange is to be for the present £1=20.42 marks. British silver coins will also be accepted by the public Treasury to the amount of 20 shillings, and for a period of at least two years at the rate (liable to alteration) of 1 shilling=1 mark.

The second of these Ordinances, which also came into force on 1st July last, gives the scale of import duties leviable in the new currency. The Tariff is now as follows:—

Tariff No.	Tariff Classification.	Rates of Duty.	English Equivalents.
		Mks. Pfg.	s. d.

9	All other articles	10 % ad val.	10 % ad val.

The Ordinances, which are too long to quote in full, may be seen in the original and in translation at the Commercial Intelligence Branch of the Board of Trade, 50, Parliament-street, S.W., any day between the hours of 10 a.m. and 5 p.m.

Russia.—CUSTOM DECISIONS.—The Russian Department of Customs have recently issued circulars relative to the classification of the following articles under the Imperial Customs Tariff:—

Solid fat worked, crude, or melted, and degreas, are to be dutiable under Section 51, Point 2 (instead of Point 3) of the Tariff, at the rate of 1 rouble 12½ copecks per pound gross (7s. 4½d. per cwt. gross), with the 20 per cent. surtax laid down by the Imperial ukase of the 5th August, 1900. [See *Board of Trade Journal* for the 9th August, 1900.]

Rollers and oval plates for phonographs, gramophones, and graphophones, are to be dutiable under Section 172, Point 4, of the Tariff, at the rate of 15 copecks per funt (£1. 19s. 4d. per cwt.).

San Salvador.—CUSTOMS MODIFICATIONS.—Several Laws and Ministerial Ordinances affecting the tariff of San Salvador, appeared during last year in the *Salvadorian Diario Oficial*. The following modifications of the Customs Tariff have accordingly to be noted:—

Bags containing coffee intended for export are exempt from all duties.

Coloured cotton yarn is subject to an import duty of 5 centavos per kilog.

Unbleached cotton tissue ("mantadril"), with a single coloured stripe not exceeding 1 centimetre in width, is dutiable as "cotton drill, uncoloured," at the rate of 20 centavos per kilog.

Sheet cotton wadding for padding the interior of clothing is dutiable at the rate of 2 centavos per kilog.

Bags. Empty bags, intended to contain indigo for export, are dutiable at the rate of 50 centavos per kilog. The amount of import duty paid on bags in which ores are exported, will be refunded in cash to exporters of ore, at the time of exportation.

Indigo is now exempt from all duties on exportation.

Sweden.—CUSTOMS ALTERATIONS.—The following alterations have been made in the Customs Tariff of Sweden by Royal Decree, taking effect from the 1st ult. :—

Tariff No.	Articles.	Rates of Duty.	English Equivalents.
64 ¹ A	Embroidered articles, not specified, finished or begun— Embroidered ribbons of cotton tulle, even when provided with other needle-work; also similar embroidered tissues, manifestly intended to be cut up into ribbons	Kron. öre.	s. d.
64 ² B	Embroidered ribbons of other cotton or of linen tissue, even when provided with other needle-work; also similar embroidered tissues, manifestly intended to be cut up into ribbons	Kilog. 6 50	Lb. 3 3 ¹
	Other kinds	" 5 50	" 2 9 ¹
	As the material upon which embroidered, with an addition of 100 per cent.		
	<i>Note.</i> —No deduction made for boxes, paper envelopes, cards, or packing paper.		
	<i>Colours and colouring substances.</i>		
141	White lead, of all kinds	Free.	Free.
284 ²	Chemico-technical preparations, not specified— Chloride of gold, chloride of gold and potassium, chloride of gold and sodium (gold-salt), chloroplatinite of potassium, and chloride of platinum	Kilog. 0 08	Lb. 0 0 ¹
591	Playing cards, and painted or printed cardboard in the sheet, whether with or without figures, intended to be cut up	" 1 50	" 0 9
	<i>Note.</i> —A special regulation lays down the formalities to be observed before the cards are delivered to the owner.		

TRANSPORT AND FREIGHTS.

The Freight Market.—Outward rates are weak, but in most directions not quotably lower. Last fixtures have been on basis of Genoa, 5s. 6d.; Malta, 4s.; Venice, 6s.; Alexandria, 5s.; Las Palmas, 6s.; Buenos Ayres, 9s. 6d.; Colombo, 10s. American markets are in a state of stagnation. **Australia** continues weak. Current quotations are 27s. 6d. Europe, 25s. Africa, Newcastle-Manila 12s. 6d., Java 10s., Singapore 8s. **Black Sea** easy, Odessa berth paying 9s. **Eastern** markets steady at slightly improved rates. Bombay paid 15s. 6d., Kurrachee 16s., Calcutta 22s. 6d., Rangoon 21s. 3d. **Mediterranean** markets are extremely dull, and no business has been effected except in ore. **River Plate** steady at 17s. 6d. San Lorenzo limit.—WEDDELL, TURNER & CO., London, January 22, 1902.

UNITED KINGDOM.

Manchester Ship Canal.—The Manchester racecourse at New Barnes has now been purchased by the Ship Canal Company for the sum of £265,000. The acquisition of the estate will enable the Ship Canal Company to carry out extensions to their docks which have been long needed, and already the work of constructing a through railway round the course has been commenced. It has been estimated that the proposed new works will nominally increase the capacity of the docks for ocean traffic by something like 70 per cent. No fewer than 142 acres of land will be added to the dock estate. It is proposed to ultimately construct two large new basins, each about half-a-mile in length. A portion of the dock near to Mode Wheel locks will be first made, and it is not likely that the Company will seek powers for the construction of the second dock until the first is completed. When both the docks have been made, two miles will have been added to the existing quay frontage, and berths will have been provided for 32 vessels of an average length of 330 feet. There are at present about 5¹/₂ miles of quays at the docks, but not more than three miles are actually available for the accommodation of deeply laden ships, for the docks above Trafford Bridge cannot be used by large steamers. The remainder of the racecourse estate will be utilized for the erection of transit sheds and warehouses and the provision of railway sidings. These last are needed for the proper sorting and marshalling of railway wagons containing cargo, as well as for the exchange of traffic between the Canal Company and the various railway companies whose systems are connected with the dock railways. The cost of the railway and the dock is estimated at £150,502, while £92,000 has been set apart for sidings, storage grounds, roads and subsidiary works. To these figures must be added, of course, the sum of £265,000, which has been paid for the land. The new transit sheds, it is understood, will be built by private enterprise and leased to the Company. According to the evidence given by Mr. W. H. Hunter, Chief Engineer of the Ship Canal Company, in the arbitration between the Ship Canal Company and the Racecourse Company, the amount which has been expended in the past on the construction of the Salford Docks, lying between Mode Wheel locks and the Trafford-road swing bridge, is £933,236, while a further sum of £317,467 has been expended upon the Pomona Docks, between the Trafford-road swing bridge and the Wooden-street swing bridge. In addition, not less than £907,758 has been spent in the equipment of the docks, £685,848 of this amount having been expended since the opening of the canal in 1894. The cost of the equipment of the Salford Docks was £797,930 and of the Pomona Docks £109,828. Thus the Salford Docks have already cost in construction and equipment a sum of £1,413,699

and the Pomona Docks a sum of £427,295, a total of £1,840,944, apart from the cost of the land.—*Manchester Guardian*.

COLONIES.

Transport in West Africa.—The *Gold Coast Globe* says it is now very generally recognised that the paramount difficulty which faces the mining industry on the West Coast of Africa is the lack of transport. In the past six months much has been done to combat this drawback by the construction of the railway from Sekondi to Tarkwa, and by making roads from the various coast ports to the interior and the mines. Despite this, however, the mining companies still continue to suffer greatly. Numerous mining companies whose reefs are not in the immediate neighbourhood of Tarkwa have taken a very determined attitude with regard to the vital matter of transport from the coast to the mining properties, and an elaborate scheme for utilizing the Ankobra waterway for the purpose of transport has been prepared. Although all the details have not yet been completed, the new transport system is certain to have a very marked effect on mining developments. A company has been formed which will immediately set to work and erect the necessary storehouses, and will make a complete survey of the river Ankobra and all the necessary arrangements for the commencement of active operations.

INDIA.

New Railways.—It is announced that the Secretary of State for India has sanctioned capital expenditure on railways during the ensuing financial year of 1,050 lakhs of rupees (£7,000,000). This sum is to be almost equally divided between the provision of rolling stock and other works in connection with existing lines on the one hand, and the prosecution of a construction programme on the other. Of the latter moiety, 350 lakhs will be absorbed by lines now in progress, and 174 lakhs by new railways. Of these an important one is the line which will cross the Ganges near Allahabad and connect that city with Faizabad, the centre of the fertile districts watered by the Goghra. The line, which will reduce the distance by rail between the two cities from 235 miles to 98, will cost 117 lakhs, 40 of which are allotted for the next financial year. Some of the other lines to be begun in 1902-1903 are of equal importance. The East Indian grand chord is to be completed by filling in the gap of 112 miles from Gya to Katrasgarh, which is to cost, in round figures, two crores of rupees (£1,333,000), one-fourth of which sum is now sanctioned. Twenty lakhs of the estimated cost of 50 lakhs are granted for the Jech-Doab loop, which is intended to serve the large area brought under cultivation by the irrigation canal of the same name, and will connect with the North-Western system at Lyallpur. The Bengal-Nagpur railway is to be given long-desired access to the Palamow and Daltongunj coalfields by a line bridging the Damuda river, the preliminary amount allotted being 20 lakhs. The ten lakhs set aside for the Ranaghat-Murshidabad line bears but a small proportion to the total cost of an extension which, with projected feeders, will do much for the development of Eastern Bengal. All the lines mentioned are in Bengal and Upper India, and their admission into the official programme has left little margin for expenditure in other parts of the country. But any jealousies which might otherwise be aroused in the case, at least, of Western India will be obviated, we presume, by the sanction accorded to a scheme which has for some years been pressed on the notice of the Indian Government by the Bombay Chamber of Commerce—the Godhra-Baroda chord. Forty-five miles in length, it will save nearly 30 miles in the through distance between places north and east of Godhra and south of Baroda, and obviate the delays to which the traffic of the Anand-Godhra section of the Bombay, Baroda, and Central India railway is subjected in the monsoon. There will, however, be some disappointment on the part of commercial interests in Bombay that Government is not able to include in the programme the much more important Nagda-Bara-Muttra extension, to which it is pledged, and which, by shortening very materially the connection between Bombay and "the granaries of India" in the north would be of great value in the event of famine in Southern India. Lower Burma is represented in the programme by the Henzada-Kyauing metre-gauge line, 65 miles in length, which will open up a rich rice-growing district; and Southern India by the Azikhel-Mangalore line, for which ten lakhs of rupees are allotted.

FOREIGN COUNTRIES.

China.—The Russian Amoor Company for Navigation and Trade is having a number of flat-bottomed steamers built to work in connection with the Eastern Chinese railway. Two passenger boats of the kind, and three steam tugs, are to go from Hamburg in the spring for use on the upper reaches of the rivers Amoor and Shilka.

Germany (Hamburg).—The report of the Hamburg Chamber of Commerce shows that there was a large increase in the shipping of that port during the past year. The steamer fleet of the port now numbers 521 vessels of 842,966 net register tons, against 486 steamers of 748,435 tons a year ago; and the sailing fleet 333 vessels of 242,765 tons, against 307 vessels of 240,419 tons. It is admitted that ocean freights are now 30 to 40 per cent. lower than a year ago, which is considered a serious matter in view of the high prices of coal and the higher level of wages.

Portuguese West Africa.—The *Engineering News* (New York) reports that the Compagnie de Mossamèdes (Paris) has received a concession of land in Angola from the Portuguese Government for a railway from Port Alexander to the interior. Amongst the projects of the Company are the establishment of a port, construction of quays, docks, telegraphic lines, etc. The concessionaires have recently made numerous mining concessions to subsidiary companies.

United States.—PANAMA CANAL.—The report of the Isthmian Canal Commission was published on the 20th January last, and, as was expected, was in favour of the acceptance of the offer of the Panama Company to sell its property to the United States for \$40,000,000. The report of the Commission is unanimous, and is to the effect that, after considering the changed conditions now existing and all the facts and circumstances upon which its judgment must be based, the Commission is of opinion that the most practical and feasible route for the canal is the Panama route.

United States.—NEW LINE OF STEAMERS FROM NEW YORK TO THE LEVANT.—It is reported that the Hamburg-American Steamship Line have made arrangements for a line of steamers between New York and the Levant. The plans are completed, and in February a fleet of four ships will be started running. The trips will be made monthly, and while the vessels will be principally devoted to freight, there will also be accommodation for a few passengers. Among the ports which will be touched are Malta, Alexandria, Smyrna, Athens, Constantinople, Odessa, and intermediate places. The round trip will occupy about two months. As business increases the fleet will be enlarged and more frequent trips will be made. It is also stated that the same company is building two new steamers for service between New York and Hamburg—the *Moltke* and the *Blucher*, each of which will be between 12,000 and 13,000 tons. They will have no first-class accommodation,

and will be used mainly as cargo boats. The first of these vessels will make her maiden trip next March.—STEAMSHIP SERVICE WITH THE WEST INDIES AND SOUTH AMERICA.—The United States Steamship Company, which is organising a direct steamship service between Boston, the West Indies, the Mexican Gulf ports, and South America, will place 14 boats in the line. The carrying capacity of four of these steamers will be 10,000 tons each, of six of them 5,500 tons, and of the other four 2,500 tons. The four largest ones will run to Mexico and South America, the six medium-sized ones to Cuba and Porto Rico, and the four smallest to different ports of the Islands. The operations are expected to commence at the end of this month.

OFFICIAL AND COMMERCIAL CONTRACTS.

UNITED KINGDOM.

London.—The London County Council invites TENDERS, until the 4th March, for the SUPPLY and DELIVERY into carsheds in South London of DOUBLE-DECKED, DOUBLE-BOGIE, ELECTRIC-FRAMECARS. Particulars (£3) may be obtained at the County Hall, Spring-gardens, S.W.

North Eastern Railway.—The Directors invite TENDERS, until the 12th inst., for the WIDENING of a PORTION of the MAIN LINE between Newcastle and Leamside, from Penshaw Junction to Wapping Bridge, being a distance of about 1¹/₂ miles. Particulars may be obtained from Mr. Charles A. Harrison, Central Station, Newcastle-on-Tyne.—The Directors also invite TENDERS, until the 12th inst., for the CONSTRUCTION of a NEW RAILWAY BRIDGE and APPROACHES thereto over the river Tyne at Newcastle. The bridge is for four lines of rails, and is 110 feet above high water. Particulars may be obtained as above.

Stamford.—The Corporation invite TENDERS, until the 17th inst., for the following new SEWERS, together with MANHOLES, LAMPHOLES, FLUSHING TANKS, VENTILATORS and other WORKS connected therewith. About 20,560 yards of STONEWARE PIPE SEWERS (from 6 in. to 21 in.). Also for about 2,280 yards of CAST IRON PIPE SEWERS (6 in. to 21 in.), with CONCRETE MANHOLES. A short length of 30 in. CONCRETE SEWER; SEPTIC TANKS; EJECTOR CHAMBERS, CONCRETE CARRIERS, DISTRIBUTION CHAMBERS, and other works. Particulars (£5) may be obtained from J. B. Everard, 6, Millstone-lane, Leicester.—The same Corporation also invite TENDERS until the 17th inst., for the ERECTION and COMPLETION of an ENGINE HOUSE, COTTAGE, and OUT-BUILDINGS thereto, to be erected in Albert-road, Stamford. Particulars (£2. 2s.) may be obtained as above.

Woolwich.—The Secretary of State for War is prepared to entertain PROPOSALS for FILLING-UP the INNER BASIN of the Royal Dockyard, Woolwich. Particulars may be had on application to the Superintendent, Building Works Department, Royal Arsenal, Woolwich.

COLONIES.

New Zealand.—TENDERS are invited by the New Zealand Government for a DIRECT STEAM SERVICE between NEW ZEALAND and SOUTH AFRICA, and for an Alternative Service between New Zealand, Western Australia, and South Africa. The service to be monthly from four loading ports in New Zealand in geographical order, and three ports for discharge in South Africa, namely:—Durban, Port Elizabeth, and Table Bay. The maximum subsidy available for such service is £30,000 per annum, the present contract to be for three years. The steamboats must be fitted up with refrigerators for frozen meat and other refrigerated produce. The steamboats must be not less than 2,000 nor more than 4,000 tons capacity draught, and when loaded must enable them to discharge alongside the wharves of the above-mentioned ports. Accommodation must be provided for passengers, mails, and live stock. Preference will be given to tenderers offering highest speed and best passenger accommodation, speed to be not less than ten knots per hour. The rates of freight from New Zealand to South Africa to be as follows:—Wheat and flour, 30s. per ton weight; barley, 32s. 6d. per ton weight; oats, 35s. per ton weight; bran, 40s. per ton weight; potatoes (in sacks), 40s. per ton weight; hay (oaten or meadow), pressed in bales, 37s. 6d. per ton of 50 cubic feet measurement. Frozen meat and dairy produce at current summer rates ruling between New Zealand and London. Potatoes in boxes, 37s. 6d. per ton of 50 cubic feet measurement. Other goods at proportionate rates not less than those current between New Zealand and London from time to time to be fixed by the New Zealand Government. Contractors tendering for alternative service to state prices of cargo for Western Australia discharging at Fremantle, the maximum cargo for Western Australia to be not more than one-quarter, and minimum if offering not less than three-sixteenths (3/16) of steamers' carrying capacity. Marked written or telegraphic tenders, to be addressed to the Secretary, Industries and Commerce, Wellington, New Zealand, or to the Agent-General for New Zealand, 13, Victoria-street, London, S.W., will be received up to the 14th inst.

Victoria.—The Committee of the Fund for the erection of a Memorial to Her late Majesty Queen Victoria in Melbourne, Victoria, Australia, invite DESIGNS from sculptors for a statue of Her late Majesty in marble or bronze. Designs to be sent in to the Agent-General for Victoria in London not later than 1st May, 1902, or to the Town-clerk of Melbourne (hon. secretary to the Committee), at the Town-hall, Melbourne, not later than 2nd June, 1902. Information can be obtained at the office of the Agent-General for the State of Victoria, 15, Victoria-street, Westminster.—TENDERS are invited by the Government of Victoria, until the 14th April, for 15,850 tons of STEEL RAILS and 1,505 tons of FISHPLATES. Particulars may be obtained from the Agent-General for Victoria, 15, Victoria-street, S.W., on and after the 10th inst.

INDIA.

Bengal-Nagpur Railway.—TENDERS are invited, until the 11th inst., for BRIDGEWORK (150 ft. spans). Particulars may be obtained at the Company's office, 132, Gresham-house, Old Broad-street, E.C.—The same Company also invites TENDERS, until the 18th inst., for 175 BOGIE COVERED GOODS WAGONS, of steel throughout, 30 ft. long by 6 ft. 6 ins. wide, complete with wheels and axles. Particulars may be obtained at the Company's office.

Southern Mahratta Railway.—TENDERS are invited, until the 11th inst., for (1) Paints, etc.; (2) Red and White Lead; (3) Turpentine; (4) Files; (5) Miscellaneous tools and stores. Particulars (1 and 2, £1. 1s. each; 3, 4, and 5, 10s. 6d. each) may be obtained from the Company's office, 46, Queen Anne's-gate, Westminster.

FOREIGN COUNTRIES.

Egypt.—TENDERS are invited by the Egyptian Government, until the 20th inst., for the SUPPLY of STATIONERY. Particulars and samples may be examined at the Commercial Department of the Foreign Office.

COMMERCIAL LAW INTELLIGENCE.

Freight Dispute.—In the Admiralty Division, an appeal was heard from a decision of the Judge of the County Court at Cardiff. The OWNERS of the *Dowlais* (s.) sued MESSRS. BUDD & Co. for £9. 6s. 5d. balance of freight. Under a charter-party dated 12th January, 1900, plaintiffs agreed to carry for defendants a cargo of pit-props from Bordeaux to Newport on the payment of freight at the rate of 6s. 3d. per ton of 20 cwt. delivered "or on intake weight less 2 per cent. at charterers' option." The intake weight of the cargo was 1,272 tons, and the weight delivered was 1,277 tons. When the freight was paid defendants claimed to pay freight on the intake weight less 2 per cent. Plaintiffs contended that the 2 per cent. option must be declared before bulk was broken, and that as defendants had not declared it freight must be paid on the delivered weight. The County Court judge had held that the option was given for the benefit of the charterers only. He considered that defendants could not fully exercise the option until the cargo had been delivered and weighed, and that until that was done they were not in a position to know how the option could be exercised so as to give them the benefit which it was proved by the charter-party they should have. He had given judgment for defendants. Plaintiffs now appealed, contending that the judge's decision would have the effect of depriving the shipowner of his lien for freight. Their lordships dismissed the appeal with costs. Sir Francis Jeune, in giving judgment, said that in his opinion the option must be exercised when it is necessary it should be exercised, or, to put it in a more concrete way, either at the time of the tender or at the time of payment. If the lien was insisted upon, of course, he said, a tender or payment must be made, and in those circumstances necessity arises then for exercising the option, but if the lien was not insisted on then the necessity did not arise till later, namely at the time of payment. Leave to appeal was refused.

Preference Shareholders' Rights.—In the Chancery Division Mr. Justice Farwell delivered judgment in the case of *BOND v. the BARROW HEMATITE STEEL CO., LTD.*, by which the plaintiffs, who are preference shareholders in the defendant company, claimed that profits made by the company since 1898, amounting to nearly a quarter of a million, should be paid to them as dividend. Mr. Justice Farwell stated that the contention of the plaintiffs was that they were entitled by contract to be paid a preferential dividend out of the balance to the credit of the profit and loss account in each year, and that the company should not appropriate any part of such balance to reserve or carry over one shilling until they had been paid in full. He did not think that the resolutions creating the preference shares gave that class of shareholders new rights by rescinding the articles relating to declarations of dividends, formation of reserve fund, and the like. The resolutions must be read as subject to the provisions of the articles of association, and the plaintiffs' case failed.

Passengers and their Tickets.—In the Court of Session, Edinburgh, Mr. S. CUNNINGHAM sued the GLASGOW AND INVERARAY STEAMBOAT COMPANY, LTD., for £500 damages. On the 4th September last plaintiff bought two first-class tickets at St. Enoch Station, Glasgow, for the Inveraray tour from Glasgow. On the return journey on the *Lord of the Isles*, the portions of the tickets applicable to the stage between Inveraray and Greenock were collected on the steamer, and two checks marked "cabin" given to the plaintiff. Plaintiff not expecting to be asked for the checks again, did not take particular care of them, and he forgot where he put them. When the steamer arrived at Greenock plaintiff on getting on the gangway to go ashore, was asked for his tickets. He explained that he had given up his tickets, whereupon the checks were demanded. On plaintiff failing to produce these at once, he was, he alleged, violently pulled off the gangway and the steamer was started. The officials refused to allow him to land at Glasgow until he had given his name and address to a policeman. It was contended that the whole of the proceedings were malicious and unwarrantable. The jury returned a verdict for plaintiff, and assessed the damages at £150, holding that the check ticket which plaintiff had was not a receipt showing payment for his fare, and was not a substitute for his travelling ticket.

Sale of Food and Drugs Act.—In the case of *SMITH v. WIDEN AND OTHERS*, the question arose whether the sale of marmalade which contained 13 per cent. of starch glucose constituted an offence under s. 6 of the Sale of Food and Drugs Act, 1875. That section makes it an offence to sell to the prejudice of the purchaser any article of food not of the nature, substance and quality demanded by the purchaser. The evidence showed that marmalade was a preserve composed of fruit boiled with cane or beet sugar, but that there was no standard, and the recipes varied; that glucose was used by many manufacturers, and prevented the marmalade from crystallizing and prevented fermentation and mildewing, and was not injurious to health. The magistrates convicted, and the conviction was upheld by the Quarter Sessions. The Divisional Court quashed the conviction and the Lord Chief Justice said that the difference between the article demanded and that supplied must be to the prejudice of the purchaser; the object of the Act was the protection of health; in the present case the article was rather the better for the addition of the glucose.

BRITISH CONSULAR REPORTS.

Chile.—The official statistics of the foreign trade of Chile for 1900 are summarised in a report issued by the Foreign Office. Last year the trade amounted to 296½ million dollars (or pesos), or 22½ millions sterling, at the nominal exchange of 1s. 6d. per peso. This is a very substantial improvement—over two millions sterling—on the trade of 1899. The imports amounted to nearly 9½ millions sterling, and the exports to over 12½ millions, being an improvement under both heads on the previous year, but chiefly in imports. Great Britain, Belgium and Portugal are the only European nations whose imports to Chile have declined; German imports have increased considerably, as have those of the United States and France. But Australia and India have also increased their share of the import trade, the increase of Australia alone being double that of Germany, owing to the large quantity of coal (valued at £604,111 in 1900) the former sends to Chile. Wheat, copra and tallow are other important items in the trade of the Commonwealth. If the British Empire rather than the United Kingdom alone be taken, British trade with Chile has increased and not decreased. The total imports of the United Kingdom to Chile in 1900 amounted to £3,186,145, those of Germany amounting to a little over two-and-a-half millions, and of the United States to less than one million. The total for the British Empire was just under four millions sterling, or nearly half the total import trade of Chile, on which the editor of the Chilean official publication remarks:—"The result is, therefore, that the United Kingdom occupies the first place among all the providers of our articles of consumption, a pre-eminence maintained for many years, and which the efforts of the other nations have not sufficed to break down." Germany's share of the imports was 26 and the United States' share 9 per cent. of the whole. It seems, also, that the apparent decrease,

as compared with 1899, in the trade of the United Kingdom is due to a rearrangement of the statistics, whereby Australian coal, which formerly appeared under the United Kingdom, is now included with other imports from the Commonwealth. At the Buffalo Exhibition of 1901 the Chilean exhibits carried all before them amongst South American countries. They consisted mainly of wines, cognacs, furniture, textiles, drugs, hides, decorative leather, candles, parquet flooring, boots, cigars, perfumery and soaps. The main imports which show a tendency to increase are sugar, coal, cashmeres, flannels, wheat, tallow, glassware, galvanized iron, cottons, woollens, and stearine. Tea is also increasing and is ousting maté, which is the drink of the country people. It is curious to note that in spite of the heavy duty of 60 per cent. which has been imposed on certain articles for the past three years, most of these articles show a steady increase year by year. Although British trade with Chile is in a very satisfactory condition, the report gives a long list of goods in which it ought to have a larger share. It is admitted that there has been a great improvement in British methods in the last two years, especially in such matters as trade lists and the number and class of commercial travellers. The increase in the export trade is due to more nitrate being sent, and to the development of the copper industry around Coquimbo. In exports the British Empire remains pre-eminent; it took all but three-quarters of the whole last year. Nitrate absorbed three-quarters of this share, copper, chinchilla, beans, guano and wool being the chief remaining items. British trade promises to hold its own in the future in Chile; British merchants resident there do not hold the same position that they did in the old days when they had no rivals; but the German firms in the country now sell British goods, and this will probably continue so that British trade does not lose. On the other hand British merchants in the country are proving themselves fully equal to the changed requirements of the day, and there are still great possibilities for British commercial energy in the country.

France.—THE CYCLE AND MOTOR-CAR INDUSTRY IN FRANCE.—The Consul-General at Paris, in his last report on French trade, states that in 1900 the number of registered cycles in France was 975,878, of motor-cycles 11,252, and of automobiles 5,286. The department of the Seine had 212,510 cycles, 3,449 motor-cycles, and 1,436 automobiles, the Nord and Seine-et-Oise came next in importance with over 40,000 cycles each. The use of motor cars has made such strides in France in recent years that it has given rise to an important and ever-increasing industry, France being probably ahead of all other countries in this respect as well as in the numerous subsidiary industries which it creates and fosters. Of late numerous competitions have been held to popularise the use of alcohol in place of petroleum essence for propulsion, and it is thought that one result of this substitution will be an improvement in the position of the cultivators of all crops from which alcohol can be extracted. The motor race from Paris to Berlin is said to have brought orders to motor manufacturing firms in France to the value of nearly four-and-a-half millions sterling. A decree of March 10, 1899, as modified by one of September 11, 1901, governs the driving of motor-cars. The effect of these is that there must be no leakage from reservoirs containing explosive or inflammable matter; the mechanical parts must be so arranged that there is no noxious odour, and that the noise does not frighten horses; that all cars weighing more than 7 cwt. must have a reversing gear, while all cars whatever must have two separate and efficient brakes; each car is to be numbered and have a certificate from a Government engineer that it fulfils the requirements of the law; every driver must have a certificate of competency; the speed is never to exceed 18½ miles an hour in open country, 12½ in populous places, and the pace of a man on foot in encumbered and narrow passages. Every car must have a trumpet or horn and a white and green light in front. Road races can only take place by the special authority of the Prefect or Prefects, but in no circumstances is the speed in populous centres to exceed 12½ miles an hour. The regulations for the examination of drivers and for sizes of the lettering on cars are very detailed and strict, but the examiners of drivers are informed that their extensive powers should be regarded by them, not as a means of hindering a rising industry which deserves every encouragement, but of granting facilities for it, always bearing in mind the safety of the public on the roads.

FOREIGN CONSULAR REPORTS.

Demand for Pitch.—The Compagnie des Mines de la Grande Combe, 17 rue Haxo, Marseilles, state that they are desirous of receiving offers to supply about 5,000 tons of coal-tar pitch, for immediate delivery at the port of Marseilles or Cette. This company's annual needs amount to 30,000 tons. The Compagnie des Mines de la Grande Combe have heretofore placed their contracts for tar (brai) in England, and they intimate that, if American exporters can deliver this article in Marseilles or Cette for less than 47 francs (\$9.07) per ton, it will not be difficult to come to terms. These buyers supply samples to importers, and require that deliveries be in conformity therewith. This merchandise is not packed in barrels by the English exporters, but is dumped into the vessel's hold, like coal. It is probable that a freight rate about on a level with that demanded for coal could be obtained for pitch. Latest quotations for whole cargoes from the United States to Mediterranean ports are 9s. 6d. (\$2.31), and still better offers have been made quite recently. United States Consul Kehl reports from Stettin that the James Stevenson Aktien Gesellschaft, of Stettin, wish to buy coal-tar pitch. The article must be almost pure, not to exceed one-half of 1 per cent. of ash. The Consul is informed that the present supplies of the firm come from Great Britain, and the cost is about 40s. per ton c.i.f. Stettin. Correspondence can be conducted in English.

Photographic Apparatus in Brazil.—The United States Consul at Bahia reports on an opening for photographic apparatus and supplies in Brazil, stating that the camera that seems most popular is the smaller size of what is styled "cycle camera," with rapid rectilinear lens, bulb shutter and single swingback. A decided preference is shown for plate holders of metric sizes, doubtless because supplies have always been imported into Brazil in those sizes, the metric system being used there. The papers in use are gelatine printing-out paper, both plain and matte, and a quick-printing developing paper. The Consul adds that until recently the professional photographers had for the most part been using iron developers, but now they seem to have turned to metol and hydroquinone. Two are relying chiefly on pyro. The amateur uses metol and hydroquinone, either separate or combined, while a few are using glycine.

Rhodesia.—COMMERCE AND INDUSTRY.—The United States Consul at Elbenstock thus summarises the commercial possibilities of Rhodesia. Situated in the heart of the Dark Continent, bounded on every side by the colonies of Great Britain, France, Germany, Portugal, and Belgium, lies a country as yet but little known, controlled by a great stock company famed for its commercial and political enterprises in South Africa. The Chartered Company is to Rhodesia what the East India Company was once to India. Rhodesia is divided into two parts—Mashona and Matabeleland south of the Zambesi

and North-East and North-West Rhodesia north of that river. The whole country is extraordinarily rich in mineral treasures. Apart from the gold mines, which in spite of the war and scarcity of labour, yielded during 1900 nearly 166,000 ounces, there are silver, copper, tin, antimony, arsenic, lead and coal. Railroad building in Rhodesia, according to German reports, is making rapid progress. The stretch from Bulawayo northward to Salisbury will soon be completed, thus connecting Cape Town by rail with Beira, the seaport town of Portuguese Gasaland. The great Cape-Cairo railway, planned by Mr. Cecil Rhodes—an enterprise of immense importance to all Africa—will intersect Rhodesia from north to south. There are already some 3,000 miles of roadway, with intervening cart roads, built in South Rhodesia. In regard to agriculture, much remains to be done. The rich soil is eminently adapted to growing corn, oats, potatoes, tobacco, and even coffee. The vast territory adjacent to the head waters of the Zambesi and its tributaries forms the Mississippi Valley of Africa. It has a great future, and the next ten years will witness a large emigration, not only to Rhodesia, but to England's other South African colonies as well. It will be the policy of the Chartered Company and of the British Government to encourage English settlers to locate in these colonies. The discovery of gold in South Africa induced many Americans to locate on the Rand. The opening up of vast tracts of land favourable to farming may produce similar results. After the war is over, there will be a great demand for corn-planters, harrows, cultivators, reapers, mowers, hay-rakes, seeders, ploughs, disks, thrashers, corn-shellers, wagons, carriages, carts, harness, saddles, wind-mills, and every other piece of machinery or utensil necessary to run a farm. South Africa as a farming country has a future, and the British Government, from a political point of view, will make doubly welcome settlers of the English-speaking race.

Rubber Culture in Venezuela.—United States Consul Goldschmidt transmits an article published in the *Venezuelan Herald*, which, the Consul notes, is of unusual interest to all who wish to study the cultivation and exploiting of rubber, on account of the details and apparent knowledge of a subject generally very little known. The article is by Dr. Lucien Morisse, who, in the course of explorations on the Orinoco and in the district of the Rio Negro, has executed much medical and botanical work. He states that Orinoco or Ciudad Bolivar caoutchouc is exactly the same as that found on the Amazon, and known as Para caoutchouc; it is extracted from the same tree, and the method of collection is similar. The various classes of caoutchouc found in these regions are species of *Hevea*, which belong to the great family of *Euphorbiaceae*; the caoutchouc of the Orinoco is, therefore, the true *Syringa Braziliensis*. The product of the caoutchouc is everywhere the same—the Para—except, perhaps, that of Guayana, which, when the sheet is fresh, is of a bluish white; when, however, it is dry, it is impossible to distinguish it from the pure Para. These species are very different from that which comes from Africa, especially Madagascar, which is generally the product of *Ficus elastica* (a fig and not a *Hevea*), and are superior to them, Para caoutchouc being most highly esteemed and the dearest, on account of its several qualities. *Ficus elastica* is found on the Amazon and the Orinoco, and produces a milk; but, naturally, in the regions where the *Hevea* are so numerous and productive, that species is not exploited. It is curious to remark that while the *Hevea* is called *Syringa* in Brazil, it is called caoutchouc in Venezuela, where the *Syringa* is called the *Ficus*. All these various caoutchoucs, known as Para, generally reach the markets of Europe in the form of large loaves of first, second and third quality, and the residue in the shape of balls. The sap of the *Hevea* is a milk found in the bark of the tree, which ascends and descends naturally like all sap, according to the season of the year, and advantage is taken of this law to gather it by means of incisions made in the trunk, the product of which is more abundant as the incisions approach the dermis. The *Hevea*, when cut or tapped, ratoon from the foot, and those ratoon, at the end of five years, yield a product equal to that of the original tree. The Venezuelan Government forbids the natives to fell these trees; but this prohibition is altogether unnecessary, as it relates to an immense forest, measuring upwards of 30,000,000 hectares (74,000,000 acres), where caoutchouc exists in abundance, and which it would require millions and millions of hands to exploit, whereas it only contains three or four thousand Indians, not more than the tenth part of whom are engaged in the work. Fifty thousand immigrants might well be introduced for the purpose of cutting the largest number of trees possible without the least fear of destroying the forests, and the work carried on in this fashion would, in Dr. Morisse's opinion, be more efficacious and productive. On the Upper Orinoco the caoutchouc trees begin to be found in considerable numbers only below the Falls of Maipure; on the affluents of that river, to the west or the Meta, Meseta, Tomo, Chaparo, Vicheda, the Atabapo, and to the right of the Catanopo, no appreciable number is found. The Venezuelan Guayana, or Black River, contains a number of species as far as Marao; from that point they generally become rarer, but they again abound below San Carlos, and from there on they are found at varying distances all along the Rio Negro up to its confluence with the Amazon.

Textiles in Greece.—The Austro-Hungarian Consul at Piræus, Athens, writing to his Government, notes that there is a large and profitable field in Greece for the sale of textiles, the value of the imports being from 16,000,000 to 18,000,000 francs per annum. The chief demand is for the cheaper kinds of shirting and madapolams, the imports of which exceed 2,000,000 francs. Most of the demand is met by England, Austria-Hungary following with about one-fifth of the amount of England's total trade. Recently attempts have been made to place Dutch shirting, but without success. A considerable trade is also done in all-white handkerchiefs, or white with coloured borders. The trade is exclusively in English hands.

Cleveland Iron Output.—It is believed that in the year 1901 there will have been produced about 2,800,000 tons of pig iron in what is inadequately named the "Cleveland" district—the district that stretches from Skinningrove in Cleveland to Jarrow and Consett, in Durham. This vast production is less than that of the preceding year by some 6,000 tons weekly, or thereabouts. Naturally, the effect of this reduction has been felt in the Northern industries. It represents some loss of work at the iron mines (part of the iron that would have been used is imported); it indicates a much reduced use of coke; and there is also an effect on the railway traffic, so that the diminution in the production points to a considerable falling-off in the employment of labour. Nor is there any early likelihood of recovery, for at the present time, the iron manufacture cannot be said to be a very profitable one, the cost of some of the raw materials being so high. It is quite possible that we may see a further reduction of the production of pig iron in the north-east of England in the course of the next few months—unless it should be kept off by a lower range of prices for raw materials for the feeding of the blast furnaces.—*Newcastle Chronicle*.

CHAMBERS OF COMMERCE REPORTS. UNITED KINGDOM.

Bradford.—At a meeting of the Council held on the 31st December, Mr. W. B. Gordon (president) in the chair, a letter from the Huddersfield Chamber of Commerce was read asking the Bradford Chamber to support the following resolution:—"That His Majesty's Government be urged to increase the duties on all German wines, in the event of the proposed new German tariff coming into operation." The London Chamber of Commerce also wrote with reference to the proposed organisation of a National Commercial and Industrial Congress, in order to consider what recommendation should be made to the Government with respect to the tariff. It was agreed that the Huddersfield communication should be allowed to lie on the table.

The Customs authorities wrote in reply to the Chamber's request for the establishment of a local Custom-house in Bradford, stating that they were unable to make any special concessions in favour of Bradford, and pointing out that goods free of duty were examined at the port of landing, whilst dutiable goods might be removed to local bonded warehouses.

The Governing Board of the Yorkshire College wrote asking the Chamber to appoint an additional representative on the Committee for the management of the proposed higher commercial course. Mr. F. F. Steinthal was appointed.

The president, before presenting a letter which had been forwarded to the Inspector-General in Bankruptcy, said there appeared to be an impression that the Chamber were about to discuss the merits of the Goodman Root case. The Law Amendment Committee had had no such thought in their minds. Their only desire had been to discuss the abstract question of bankruptcy law, and in accordance with this they had addressed to the Inspector-General a letter (to which a confidential reply had been received) in which, after disclaiming any concern as to the case of Goodman Root, the Committee drew attention to two points suggested by the proceedings in that case. These were as to the necessity of an amendment of the law so as to penalise debtors for failure to keep proper books of account. "It has always appeared to this Chamber," the letter went on, "that in dealing with this question the Legislature would be striking at the root of most offences in bankruptcy. The Committee are now keenly disappointed to find that, in a case in which a bankrupt—after careful preliminary investigation in the Bankruptcy Court, and afterwards before the magistrates—has been indicted at the Assizes for making fraudulent entries in his books, the charge had not even been investigated by the Court. The Committee have before their minds a similar case where in the month of February, 1896, a bankrupt was charged at the Mansion-house, London, with various offences, including fraudulent entries in his books, and these charges were similarly withdrawn on the bankrupt pleading guilty to a minor count of the indictment, the bankrupt being then sentenced to come up for judgment when called on. The Committee feel very strongly that such treatment of charges of this nature is likely to create the impression that the fraudulent manufacture of accounts is not regarded as an offence of any gravity. The Committee feel that the effect will be most demoralising if it becomes generally understood that a debtor may keep his books as fraudulently as he likes, so long as he takes care to refrain from making false entries, or makes none at all, for four months, and staves off his bankruptcy for that period."

The Committee desired to see some steps taken the effect of which would be to penalise bankrupts who have not kept proper books of account. They further thought that some steps should be taken to secure that offences under the Debtors Act shall be thoroughly investigated, and to extend the period of limitation beyond which such offences can be punished. They added that they thought of placing a resolution on the agenda for the next meeting of the Association of Chambers of Commerce, but first asked for the Inspector-General's opinion on the subject. The matter was not further referred to, but at a later stage of the meeting it was decided to forward the following resolution to be placed on the agenda of the forthcoming meeting of the Associated Chambers:—

"That the present state of the law as to the punishment of fraudulent bankrupts is unsatisfactory, and that the Executive Council be requested to consult the various Chambers of Commerce in the Association, with a view to a bill being introduced into Parliament to amend the existing law."

Other resolutions for the meeting of the Associated Chambers adopted by the Council were for the extension of the jurisdiction of County Courts so as to make it unlimited (subject to proper power of removal to the High Court), or in the alternative the establishment of no lower limit of jurisdiction than £500; and for the adoption of a uniform halfpenny inland postage for all matter enclosed in open envelopes or wrappers.

Cardiff.—THE ROYAL COMMISSION ON COAL.—At a recent meeting of the Cardiff Chamber of Commerce, the following resolution was passed:—"That this meeting of the Cardiff Chamber of Commerce, deeming it certain that questions affecting the export of coal will engage a large share of the attention of the recently-appointed Royal Commission, deeply regrets the inadequate representation, especially as regards South Wales, of the exporting interest on the Commission, and is of opinion that the findings of the Commission will not command the confidence they otherwise would." Mr. W. H. Lewis, president of the chamber, said he found that last year the South Wales district had 41½ per cent. of the foreign coal export of the country. The Commission contained one coal exporter only, and that one from the north. Mr. John Andrews, who proposed the resolution, said the idea which had been expressed by the Chancellor of the Exchequer, and which had got a firm hold of the country, that it might be a good thing to restrict export of coal, constituted a grave danger and meant disaster to the exporting and shipping interests of the country. Mr. D. A. Thomas, M.P., said it was a commercial question affecting Cardiff more than any other port in the kingdom. For several years the Government had been pressed to appoint a Royal Commission on the coal supply, and had consistently declined to do so until after the coal tax was imposed, when a promise was given. This showed that the tax and the question of exports were really the origin of the Commission. Not only had South Wales been ignored, but the whole commercial element. He questioned whether there was any precedent for the addition of a member to a Royal Commission, and if there were he doubted that the Chancellor of the Exchequer would favour the appointment. In the House of Commons he had urged the Government to see that the commercial element was adequately represented on the Commission, and a member of the Government then asked what was meant by "the commercial element." He might mention incidentally that he would take the earliest opportunity of moving the House of Commons to do away with the Board of Trade and its president, and asking for the appointment of a Ministry of Industry and Commerce, with a Minister who should have the status of a Secretary of State.

Dundee.—At a meeting on the 26th Dec. last, the president (Mr. David Macintyre), in reviewing the work of the past year, said reference was made to the circular which had been received from the Advisory Committee of the Board of Trade, requesting information in connection with the new German tariff. The opinions then expressed were kept in view in the reply given to

the Government, and were embodied in the report on the articles in which Dundee was specially interested. An assurance had been received in reply that the various points raised would have the careful attention of the Committee. The revision of the Spanish tariff, which was soon to engage the attention of the Spanish Government, gave an opportunity of again representing the exceptional rate of duty levied on the yarns of this district, more especially the heavier sizes of linen yarns. In the tariff of 1892 the rate of duty on these yarns was altered from 27½ to 45 pesetas per 100 kilogrammes. The result of that change had been not only to restrict the exports to Spain very seriously, but also to greatly hamper the weaving industry in that country. The linen manufacturers in Spain who used that class of yarns had felt the disadvantage of the high duty so much that they were now petitioning their Government for a return to the former rate—or to a still lower one. The Directors had placed all the facts bearing on the subject before the Government, and they had the satisfaction of knowing that His Majesty's Ambassador at Madrid had been instructed to take such action as might be in his power in the matter.

It was customary at the closing meeting of the year to refer to the main features of the trade, so far as its volume and value were concerned. Compared with the preceding year the importations of raw material showed an increase all round. Imports of flax and tow from 1st January, 1901, to this date had been 18,400 tons, and hemp and hemp codilla 2,090 tons, an increase of 4,000 tons of flax over the imports of 1900, hemp showing no difference. Imports of jute for the year amounted to 200,000 tons, compared with 186,000 tons in 1900, an increase of 14,000 over last year. In exports the figures testified to the restrictive production which had marked the linen trade this year. During the eleven months from the 1st January to 30th November, 11,864,000 lbs. of linen yarns, of the value of £754,000 sterling were exported, as compared with 15,000,000 lbs. —value £853,000 sterling—exported in the corresponding period of 1900, a decrease for 1901 of 3¼ million lbs. of yarn and £99,000 value. The decrease applied to all countries to which linen yarns were exported. Linen cloth had been exported to the extent of 135¼ million yards, valued at £3,350,000, as against 143 million yards, valued at £3,550,000, for the same period in the previous year, a decrease of 7¼ million yards and £200,000 value. The United States of America showed an increase of 5 per cent. and the Republic of Colombia an increase of 100 per cent. With these exceptions all other countries had taken smaller quantities of linens this year than in 1900. In jute manufactures, on the other hand, the volume of trade had been larger this year than in 1900. Jute yarn exports for the eleven months of this year had amounted to 39¼ million lbs., valued at £471,000 sterling, as compared with 35¼ million lbs., valued at £450,000 for the same period in 1900, an increase of 3¼ million lbs. of yarn and £21,000 value. Of jute cloth for the same periods the exports had amounted to 200 millions of yards, valued at £1,985,000, in 1901, compared with 157 millions of yards, valued at £1,706,000, in 1900, an increase of 43 millions of yards and £279,000 value. Three-fourths of that increase had been to the United States of America and the remainder to the Argentine Republic, Brazil, and Canada. The value of jute manufactures imported from abroad was almost exactly the same as in 1900, viz., £2,015,000. These were again exported to the extent of £1,677,000, leaving a value of £338,000 sterling as the apparent home consumption of jute cloth manufactured abroad. The corresponding figures for 1900 showed that the apparent home consumption in that year of jute goods manufactured abroad was £500,000. The high prices which were current for flax at the beginning of this year continued until towards the closing months, when the promise of a more abundant supply exercised a downward influence on prices, with a somewhat more hopeful prospect for the trade. The demand for linen goods had not been equal to the average. It had, however, been materially assisted by the requirements of the Government, but as yet there was not full employment for the looms. For the first half of the year prices of jute were firm, and gradually advanced until the opening of the new season. Thereafter, under free selling and the issue of the Government forecast, values gradually receded, but the market had again stiffened to some extent. All concerned were waiting with interest to see if the supply for the next few months would justify the expectations which had been formed as to the extent of the crop. It was always difficult to forecast the prospects of the jute trade, which from time to time underwent many fluctuations. There was no apparent reason for a desponding outlook at present, but it must be kept in mind that the legislature had decreed that the production was to be lessened after 1st January next to the extent of nearly one week in the year, and that Dundee would be to that extent handicapped in competition with other countries for supplying the markets of the world.

The President concluded by referring to the inconvenience which the trading community had suffered through the breakdown in the telegraph service throughout the country. This had been so severely felt lately that they could not allow the matter to sleep. The matter should be pressed on the attention of the Government, and they should avail themselves of the opportunity of united action with other Chambers of Commerce in this important matter.

Leeds.—At the monthly meeting on December 31, attention was given to subjects to be considered at the meeting of Associated Chambers next month. One of these related to the recent interruption in telegraphic communication on account of recent storms. The secretary (Mr. R. K. Calvert) remarked that two or three other Chambers had taken the matter up, and were proposing resolutions for the meeting of Associated Chambers. Liverpool and Edinburgh had both drafted resolutions, and, in the circumstances, it was not thought necessary to duplicate them, if they met the view of the Leeds Chamber.

The president (Mr. G. R. Portway) thought they could decide later which resolution they would give preference to. The secretary read the resolutions passed by the Edinburgh and Liverpool Chambers, as follows:—

Edinburgh.—That whereas the frequent breakdown of the telegraphic system of the country is a great disadvantage and loss to all classes, and past experience proves that no remedy is to be found for these periodical stoppages except the substitution of underground trunk lines for the present overhead system, this Association resolves that the Postmaster-General be again urged to proceed without further delay with the completion of the underground system between the main centres of commerce, and that the Executive Council be requested to arrange for an influential deputation to wait upon the Postmaster-General with this object.

Liverpool.—That in view of the great disorganisation and prejudice to business resulting from the recent stoppage of telegraphic communication within the United Kingdom, owing to the destruction by storm of the overhead telegraph wires, this Chamber is strongly of opinion that steps should be taken immediately by the Postmaster-General to place wires underground in sufficient number for emergency purposes, between London, Liverpool, and other important commercial centres of the kingdom.

The president said they had all seen the reply of the Postmaster-General to the Liverpool deputation. It seemed very largely a question of expense. The breakdown had been felt very seriously in Leeds, and they regarded it as an intolerable

interruption to business. The question of expense, whilst it might be seriously considered, was one that should not outweigh a great public improvement and the need for regular communication. It had been established that underground wires could do their work without any such risk of disorganisation as affected the overhead wires, and in the interests of commerce they ought to put pressure on the Government to get an extension of the underground system. The Government needed the commercial community behind them to make them do what they now thought they could not do. It was decided to support one or other of the resolutions at the meeting of the Associated Chambers. It was also agreed to send a communication to the Postmaster-General pointing out the great inconvenience suffered in Leeds through the recent collapse.

In answer to a communication from the Chamber, in which they sought an expression of opinion in favour of the compulsory adoption of the metric system, replies were received from all the local members of Parliament, except Mr. Lawson Walton, K.C., and Mr. Whiteley. Mr. G. W. Balfour, President of the Board of Trade, wrote—I am afraid my reply must be that, while recognising the many advantages of the metric system, I am not prepared, as head of the department which would have charge of any legislation dealing with the subject, to say that the time has come when the system could be advantageously enforced by a compulsory measure. Mr. W. L. Jackson replied—I think that in some branches of trade there is a growing opinion that the metric system would be an advantage; but I feel some difficulty as regards the compulsory adoption of the system, and I incline to think that it would be better to wait a little and see whether under the permissive system the movement makes any practical headway. Mr. H. S. Cautley answered that he was quite willing to add his name to the list of members of Parliament who are in sympathy with the compulsory adoption of the system; and Mr. Herbert Gladstone replied that he had sent in his name to the Decimal Association as a supporter of the system.

One of the subjects the Leeds Chamber proposes to bring before the meeting of Associated Chambers relates to reform of Parliamentary procedure. The united Chambers will be asked to say that an amendment of the present system of transacting both public and private business by Parliament is urgently required in the interest of commercial and other beneficial legislation, and putting forward suggestions for the re-arrangement of business and an extension of the principle of devolution.

On the motion of the president, Mr. Robinson was appointed a second representative of the Council on the committee for the management of the higher commercial course at the Yorkshire College.

Liverpool.—At a meeting of the African trade section of the Chamber, on the 21st ult., Sir A. L. Jones presiding, a reply was read from the Colonial Secretary's office at Lagos to a communication from the section, to the effect that the Governor was not prepared, without first receiving an order from the Secretary of State, to abolish any dues during the present financial year. The question of the advisability of their maintenance or abolition had been considered, and his Excellency's views had been communicated to the Secretary of State. The Government understood that the general consensus of opinion in Lagos favoured the maintenance of transit duties, and it had been pointed out to the Secretary of State that the Liverpool Chamber of Commerce had in that and all similar recommendations refrained from suggesting any substitute tax. Complaints received from West African gold-mining companies as to delay with the concessious work of the Gold Coast Court had been forwarded to the Colonial Office. Mr. Chamberlain replied that the matter was receiving his attention, and he promised a further communication on the subject. A scheme of Lieutenant-Colonel Lamprey, R.A.M.C., for providing light ambulance trains in the West African colonies had also been forwarded by the section to Mr. Chamberlain, who had replied that he was bringing the matter under the notice of the Governors of the Gold Coast, Sierra Leone, and Lagos.

GENERAL INTELLIGENCE OF THE PAST MONTH.

January, 1902.

UNITED KINGDOM.

JAN. 1st. : The Incorporated Society of Musicians held their annual meeting. Mr. J. H. Arkwright was appointed Lord Lieutenant of the county of Hereford. Death of Dr. John Birrell. Mr. John Redmond, M.P., addressed a Nationalist demonstration at Sligo.

2nd : Riots took place at Bethesda of strikers at the Penrhyn quarries. A donation of £200,000 was placed at the King's disposal by Sir E. Cassels, for charitable purposes. The National Federation of Head Teachers' Association opened their annual conference at Newcastle-on-Tyne.

3rd : The Marquis Ito was entertained at luncheon by the Lord Mayor of London. Death of Sir J. Parker Deane. Death of Prebendary Tucker.

4th : The King decided to devote Sir E. Cassel's gift to the provision of sanatoria in England for the cure of tuberculosis.

6th : Mr. Chamberlain addressed a meeting of the West Birmingham Relief Fund promoters. The King conferred the order of G.C.B. on Marquis Ito. Lord Londonderry spoke at a Unionist meeting at Chester. Death of Admiral Sir E. S. Sotheby, K.C.B. Death of Sir James Chance.

7th : Prebendary Hannah, vicar of Brighton, was appointed Dean of Chichester. Lord E. Grey addressed a meeting at Newcastle-on-Tyne on the public situation. Death of Mr. John Brett, A.R.A.

8th : The Lord Chancellor spoke at the centenary banquet of the Liverpool Underwriters' Association. Mr. Chamberlain presided as Chancellor at the Annual Court of the Governors of Birmingham University. A large convention of the United Irish League was held in Dublin. Death of Mr. Edwin John Beale.

9th : The Association of Head Masters opened their annual meeting at the Guildhall. A Conference of Science Teachers was opened at Chelsea. The Nationalists held a conference in Dublin. Death of Sir Thomas Lea.

10th : Mr. Balfour addressed his constituents at Manchester. Mr. E. B. Hoare resigned his seat as M.P. for Hampstead.

11th : Mr. Balfour was entertained at luncheon by the Manchester Conservative Association. Mr. Chamberlain spoke at the annual dinner of the Birmingham Jewellers' and Silversmiths' Association.

13th : The King and Queen returned to London from Sandringham. Sir H. Campbell-Bannerman presided at the inaugural meeting of the London Liberal Federation. Lord Henegau withdrew from the Liberal Unionist Association. 51 fresh cases of small pox were reported in London.

14th : The King and Queen visited the Albert Chapel in Windsor Castle, on the anniversary of the death of the Duke of Clarence. The Army Rifle Association held their annual meeting. It was proposed to found a British Academy. A conference on Old Age Pensions was held in Memorial Hall.

15th: The King inspected drafts of the Foot Guards proceeding to South Africa. The Archbishop of Canterbury presided at a meeting of the National Society. Death of Lord Rookwood.

16th: The King, accompanied by the Queen, opened Parliament. At the Court of Common Council at the Guildhall it was resolved to present Mr. Chamberlain with an address.

17th: The Queen Victoria Memorial Fund amounted to £187,000.

18th: Princess Louise and the Duke of Argyll visited the Alexandra Palace. Conference of Public School Science Masters was held. Death of Sir E. Ashmead-Bartlett, M.P.

20th: Mr. A. J. S. Milman, late principal clerk of the House of Commons, was appointed a K.C.B. Sir Joseph Walton was elected a member of the Senate of the London University. Death of Mr. Aubrey de Vere.

21st: In the House of Commons, in the debate on the Address, an amendment censuring the Government in the conduct of the South African War was rejected by a majority of 210. The King arrived at Windsor Castle from Penn House, Bucks.

22nd: The King, Queen, and other members of the Royal Family, attended a memorial service in the Frogmore Mausoleum on the anniversary of the death of Queen Victoria. The anniversary of the accession of King Edward was commemorated. The confirmation of Canon Gore as Bishop of Worcester took place.

23rd: Colonel Sir J. Willcocks left Southampton for South Africa. Death of Dr. F. G. Lee. Death of Sir W. Biddulph Parker.

24th: The Prince of Wales left London for Berlin. Mr. T. Milvain, K.C. (C.), was elected M.P. for Hampstead, in place of Mr. E. B. Hoare. It was officially announced that the Royal Procession through London will take place on June 27.

25th: The consecration of the Rev. G. Trower as Bishop of Likoma, and of the Rev. E. H. Elwyn as Bishop of Sierra Leone, took place in Westminster Abbey. No news was received of the missing sloop *Condor*. Commander A. I. Loane, R.N., was appointed Captain-Superintendent of the *Exmouth*. Death of Professor A. B. Davidson.

27th: At a town's meeting held in Liverpool it was resolved to establish a University for the city. In the House of Lords a resolution was passed approving the action of the Government in the war in South Africa. The annual conference of the South Wales Miners' Federation was opened at Cardiff.

28th: Mr. W. Runciman (L.) was elected M.P. for Dewsbury. In the London County Council it was resolved to issue a loan of £3,000,000 Consolidated 3 per cent. stock at £98. 10s.

29th: The King and Queen returned to Marlborough House from Windsor Castle.

30th: The Prince of Wales returned to London from Germany.

COLONIES.

Australia.—14th: In the Federal House of Representatives, a resolution was passed repudiating the calumnies on the British army, and promising further aid to end the war in South Africa.—23rd: A further contingent of 1,000 men for South Africa was authorised. **New South Wales.**—13th: Owing to the indisposition of Sir F. Darley, the Lieutenant-Governor, Mr. Justice Owen was appointed Deputy Lieutenant-Governor.—21st: Three special commercial representatives were appointed for London, Japan, and South Africa. Mr. C. C. Lance, manager of the Fresh Food and Ice Company, was selected as commercial agent in London.—30th: Vice-Admiral Sir Harry H. Rawson was appointed Governor of the State. The Right Rev. C. G. Barlow, Bishop of North Queensland, was elected Bishop of Goulburn. **Queensland.**—25th: The State elections were fixed for March 11. **Western Australia.**—15th: Parliament re-assembled. The Leake Government had a majority of three in the Lower House.

New Zealand.—17th: A patriotic meeting at Wellington passed resolutions approving the British conduct of the war in South Africa, and Mr. Chamberlain's refutation of foreign slanders.—21st: A ninth contingent of 1,000 men was proposed to be sent to South Africa.

British West Africa.—12th: It was announced that Colonel Festing's force had captured Soko; many submissions were made and a market opened in the capital.—16th: The Aro power was completely broken up.

Canada.—4th: M. Marconi decided to set up a trans-Atlantic wireless telegraph station on the Cape Breton coast.—11th: Death of the Hon. R. Dobbell.—14th: The Canadian Mounted Rifles left Halifax for South Africa. Sir Wilfrid Laurier was invited to the coronation of King Edward.—16th: Mr. James Sutherland was sworn in as Minister of Marine in succession to Sir L. Davies, appointed a Justice of the Supreme Court. Death of Chief Justice McCall.—18th: The mineral production of British Columbia for 1901 was estimated at \$20,713,501, an increase of 25 per cent.—28th: Three more squadrons of the Canadian Mounted Rifles left Halifax for South Africa.

Cape Colony.—1st: The new line of blockhouses from Beaufort West to De Aar was completed.—4th: General Baden Powell was presented with an address at Middelburg.—14th: Parliament was prorogued till March 4.—18th: Commandant Scheepers was executed at Graaf Reinet.

Malta.—4th: A petition was presented by the Archbishop and the Chapter of the Cathedral against the substitution of the English for the Italian language, and the imposition of new taxes.—28th: Mr. Chamberlain announced in Parliament that Italian would be retained as the official language of the Courts, and that the proposal that English should be adopted was withdrawn.

Newfoundland.—29th: The Government agreed to the renewal of the *modus vivendi* with reference to the French shore for another year.

Orange River Colony.—6th: General passenger traffic on the railway was resumed.—9th: General Elliot's columns pursued De Wet's force towards Heilbron.—11th: De Wet was baffled in his attempt to cross the railway.

Transvaal.—3rd: The Johannesburg *Star* re-commenced publication. General Botha circulated a request to the Boer commandants to continue fighting.—4th: General Opperman was killed in an engagement with General Plumer's force.—9th: Lord Milner was entertained at a banquet by the Johannesburg Municipal Council and the Chambers of Mines and Commerce.—10th: A Boer laager at Boschman's Kraal was captured.—11th: Colonel Wing captured a laager near Ermelo, taking 42 prisoners.—17th: Dr. Visser was convicted at Johannesburg of treason and breaking the oath of neutrality.—20th: Lord Methuen's force captured a Boer laager near Boschpoort.—25th: General B. Viljoen was captured at Lydenburg. General Vilonel received permission to raise a corps of 1,500 burghers.—27th: Large captures of Boers were reported.

INDIA.

7th: The Viceroy reported the number of persons in receipt of famine relief to be 140,000.—13th: The number of British soldiers who re-engaged for further service in India was stated to be 16,662.—17th: The Government issued a resolution dealing with recent attacks on the land reserve system.—22nd: A public

meeting of merchants and others interested in the tea industry was held at Calcutta.—26th: The number of persons in receipt of famine relief rose to 208,000.—27th: The Viceroy appointed a Commission to visit the Universities and Colleges of India and enquire as to their working.

FOREIGN COUNTRIES.

Argentine Republic.—4th: It was reported that the dispute with Chile had become aggravated; and it was proposed to break off negotiations.—8th: It was stated that the incidents with Chile were closed satisfactorily.

Austria-Hungary.—23rd: The Archduchess Elizabeth Maria of Austria was married to Prince Otto of Windischgratz.

Belgium.—1st: The population of Belgium was stated to be 6,693,000.—3rd: A Bill to make Sunday labour optional was proposed to be introduced.—14th: A Bill was introduced into the Chamber to indemnify Ostend and Spa for the suppression of the casinos.—20th: The Sugar Conference re-assembled at Brussels.—23rd: The Sugar Conference at Brussels discussed the bounties question.—24th: The Government Military Reform Bill, providing for the reduction of the term of service and an increase of 20 per cent. on the effective strength, was passed by the Chamber.

Bulgaria.—3rd: A new Cabinet was formed under M. Danef.—5th: The Solbranje rejected the Ministerial demand for supplies for two months, and was dissolved.

Chile.—2nd: It was announced that the peace protocol had been accepted by the Argentine Government. The calling out of the Chilean reserves was postponed.—3rd: An internal loan of £3,000,000 in 7 per cent. bonds was proposed.

China.—3rd: The Court arrived at Pao-ting-fu.—7th: The Court made a magnificent state entry into Peking. The Emperor and Empress-Dowager were attended by 1,000 Chinese nobles.—10th: Chang-Po-hoi was appointed Minister of Education; Wang Wen Shao, Director of the Board of Railways and Mines, and Yuan Shih-Kai was nominated Director-General of the Peking-Shan-hai-Kwan railway.—22nd: The Foreign Ministers presented their credentials to the Emperor and Empress-Dowager.—23rd: The Nan-king and Wu-chang Viceroy's were ordered to Peking. Yuan Shih-Kai urged the necessity of reforms.—25th: It was stated that a treasure of one hundred million taels was found intact in Peking where it was buried before the flight of the Court. The Court granted to Yuan Shih-Kai a sum of five million taels annually for the maintenance of an army of 100,000 men in the province of Chih-li.

Colombia.—20th: The revolutionary gunboats attacked the Government vessels in Panama Bay. Dr. Alban, the Governor of Panama, was killed.

Congo State.—8th: A commercial treaty was signed with France.

Cuba.—21st: It was announced that Señor T. E. Palma was elected President of the new Republic of Cuba.

Denmark.—13th: A deputation waited on the King with a monster petition against the sale of the Danish West Indies unless the islanders wished.

France.—14th: M. Paul Deschameli was re-elected President of the Chamber of Deputies.—18th: The Paris Municipality decided to grant to a company a 50 years' monopoly of the gas supply.—22nd: The Chamber of Deputies adopted a Bill abolishing the drawback of 14 per cent. on the sugar extracted from molasses.—28th: The Chamber adopted a Bill for expending about 600,000,000f. on canals and waterways.

Germany.—6th: The German Ambassador to London, Count Wolff Metternich, was entertained at luncheon by the Senate of Hamburg.—8th: The Reichstag re-assembled, and the Prussian Diet was opened.—11th: It was announced that Prince Henry of Prussia would attend the ceremony of the launch of the Emperor's new yacht at New York.—14th: Prince Henry of Prussia was named to represent the German Emperor at King Edward's Coronation.—25th: The Prince of Wales arrived in Berlin and was received by the German Emperor.—26th: The Prince of Wales was appointed Chief of the Deutzer Cuirassiers.—27th: The birthday of the Emperor William was celebrated in Berlin.—28th: The Prince of Wales left Berlin for Neustrelitz.

Holland.—11th: Death of Prof. Cornelis Petrus Tiele at Leyden.

Japan.—5th: The question of the purchase of the railways by the Government was revived.

Norway.—11th: The new State Loan of 35,000,000 kroner was concluded.

Paraguay.—10th: The Presidential election caused a revolution. President Aceval resigned. The revolutionary party supported the candidature of Señor Guillermo Rios for the Presidency.

Persia.—3rd: It was reported that the Sultan of Nijd was marching on Koweit.

Portugal.—2nd: The Cortes was opened by the King in person.

Russia.—7th: Death of M. de Bloch, Councillor of State.—14th: The Budget for 1902 showed a deficit of 143,987,494 roubles.

Spain.—15th: The labour difficulty at Barcelona became more acute.—22nd: The Finance Minister introduced a Bill in the Chamber establishing in the Bank of Spain a separate department of note issues.

Switzerland.—3rd: It was reported that 6½ miles of the Simplon tunnel were completed.

Turkey.—1st: The Embassies protested against the exaction of the Salonika quay dues, without the previous consent of the Powers.—15th: The provisional Baghdad railway convention was agreed to.—15th: The periodical instalment of the Russian war indemnity, £1350,000, was paid into the Ottoman Bank.—17th: An Irade was issued authorising the signature of the Baghdad railway convention.—23rd: The Baghdad railway convention was signed.

United States.—4th: It was notified that the Panama Canal Company offered to transfer all its properties and concessions for £8,000,000.—7th: A Bill was introduced into the New York State House of Assembly making it treason with death penalty, for any attempt on the life of the President, or of the Governor of New York State.—8th: Mr. Payne was appointed Postmaster-General; Mr. Shaw, Secretary to the Treasury; and Mr. John Crossland, Minister to Liberia.—9th: The Nicaragua Canal Bill passed the House of Representatives. A mass meeting of sugar planters was held in New Orleans with regard to the proposed concession to the Cuban cane-sugar growers.—11th: Mr. Croker retired from the leadership of Tammany Hall.—14th: Mr. Whitelaw Reid was appointed Special Ambassador for King Edward's Coronation.—18th: The report of the Isthmian Canal Convention was said to favour the Panama route.—21st: Mr. Croker left New York for England. The 25th annual meeting of the New York State Bar Association was held.—24th: The treaty for the sale of the Danish West India Islands to the United States was signed.—28th: Death of Rear-Admiral L. A. Kimberley.

Venezuela.—2nd: President Castro stated that the revolutionary rising was crushed. A New York despatch asserted that the revolutionists had received large supplies of arms and ammunition, and that the rising was extending.—18th: It was reported that the revolutionists under Cedeño had twice defeated the Government troops, and that a new rising had broken out near Carupano under General Vasquez.

FORTHCOMING EVENTS.

UNITED KINGDOM.

Dublin.—The Lord Lieutenant will hold a *LEVÉE* at Dublin Castle on the 4th inst.

Birmingham.—On the 8th inst. Mr. Chamberlain will preside at the annual court of Birmingham University.

London.—On the 5th inst. will be held the SPEAKER'S full-dress Parliamentary DINNER to the members of the Opposition. On the same date the CHAMBER OF SHIPPING of the United Kingdom will hold a business meeting and a dinner. On the same evening Mr. Herbert T. Thomas will lecture on "JAMAICA" at the Society of Arts.—On the 6th inst., at the Society of Arts, Professor W. R. Dunstan, F.R.S., will read a paper on "THE COAL RESOURCES OF INDIA."—On the 7th inst. Professor E. Ray Lankester will read a paper at the Royal Institution on "THE NEW MAMMAL FROM CENTRAL AFRICA and other Giraffe-like animals."—On the 10th inst., at the Royal Geographical Society, the Rev. Thomas Lewis will lecture on "THE ANCIENT KINGDOM OF KONGO."—On the 11th inst., at the Whitehall-rooms, the Hon. J. H. Turner will deliver a lecture on "BRITISH COLUMBIA OF TO-DAY."—On the 18th inst., at the Society of Arts, a paper will be read by Mr. W. T. R. Preston on "THE FRENCH-CANADIAN RELATIONSHIP TO THE CROWN."—On the 24th inst. a paper will be read at the Royal Geographical Society on "THE VOYAGE OF THE ANTARCTIC SHIP 'DISCOVERY' TO NEW ZEALAND."

Portsmouth.—NAVAL AND MILITARY EXHIBITION.—The Central News says a large naval and military exhibition will be held at Portsmouth during next June, July, and August. Among those who have given their patronage to the enterprise are the Prince and Princess of Wales, the Duke and Duchess of Connaught, Earl Selborne, First Lord of the Admiralty, Mr. St. John Brodrick, Secretary for War, and a large number of distinguished naval and military officers. The profits will be devoted to naval and military charities.

FOREIGN COUNTRIES.

Austria-Hungary.—The INTERNATIONAL FISHERY EXHIBITION to be held at Vienna will be open from the 6th to the 21st September next. The exhibition will include everything connected with the fishing industry, even to the preservation and transport of fish, both living and otherwise. Articles intended for exhibition will be allowed to enter Austro-Hungarian territory free, and will have the advantage of a reduced tariff on the railways.

France.—An INTERNATIONAL COMPETITION will take place at Paris in May next for motors and apparatus using denatured alcohol for the production of motive power, of light and of heat. The competition will be followed by a public exhibition to be held from the 24th May to 1st June. All motors and apparatus using denatured alcohol in any way, whether taking part in the competition or not, will be admitted to the exhibition; also apparatus for producing industrial alcohol, the receptacles for warehousing and transporting the product, the apparatus worked by exposed motors, denatured alcohols and their compounds. Requests for space and permission to exhibit will be received up to the 15th April.

Germany.—An EXHIBITION of the ALCOHOL INDUSTRY, especially with regard to the industrial applications of alcohol, will be opened at Berlin under the auspices of the Association of German Distillers on the 8th inst., and will remain open till the 16th.

Italy (Mantua).—An INTERNATIONAL EXHIBITION of CHEESE will be opened at Mantua, on the 18th May next, under the auspices of the Agricultural Co-operative Association of that town. The exhibition will comprise the machinery and instruments used in the manufacture and the preservation of cheese, as well as products of the cheese trade properly so called.

Russia.—The INTERNATIONAL SPORTING EXHIBITION, which is to be held at St. Petersburg in May and June next, will include automobiles (motors, etc.), velocipedes, their parts and appurtenances; aeronautic appliances of all kinds; saddlery goods, etc.; rowing and sailing boats and appliances; games; also fencing, boxing, and gymnastic properties; fire-arms and appurtenances; photography and all appertaining to it. Each section will be complete in itself. As far as possible Russian sporting clubs and societies are invited to contribute to make the exhibition fully representative of Russian sport. Foreign exhibitors will also participate. Exhibits and articles in general connected with sport can be sold at the exhibition.

NAVAL AND MILITARY INTELLIGENCE.

NAVAL.

Mr. Philip Watts's appointment as Director of Naval Construction is to date from February 1.

The large straight tube type of Yarrow boiler has been selected for the five armoured cruisers.

The *Irresistible*, battleship, will be commissioned at Chatham early in February for service on the Mediterranean Station.

The *Espiegle*, sloop, was commissioned on January 21 by Commander E. G. Barton for service on the China Station.

The destroyer *Dasher* has been selected to commission to replace the damaged destroyer *Salmon* in the Medway flotilla.

The good service pension vacant by the death of Admiral Sir George Elliot has been conferred upon Admiral Sir John Hopkins.

The *Melita*, sloop, Commander Ian M. Fraser, D.S.O., which recently returned to Devonport from the Mediterranean Station, paid off on the 17th ult.

Rear-Admiral T. S. Jackson, who has been promoted to Vice-Admiral, will complete his term of three years' service as Superintendent of Devonport Dockyard and will vacate the appointment on July 7.

Rear-Admiral Sir Baldwin Walker will hoist his flag on board the *Resolution* on February 10, from which date the battleship will be the second flagship of the Reserve Squadron, in the place of the *Sans Pareil*.

The good service pension of £150 a year, vacant in consequence of the promotion of Captain John Durnford, C.B., D.S.O., to the rank of Rear-Admiral, has been awarded to Captain George A. Giffard, R.N.

Captain Henry B. Jackson, R.N., has been appointed Assistant-Director of Naval Ordnance from February 10, on Captain George Le C. Egerton, R.N., C.B., vacating the appointment of Assistant-Director of Torpedoes.

It has been officially announced at Chatham that the Princess of Wales has graciously undertaken to name the new battleship *Prince of Wales* on the occasion of the vessel being launched on Tuesday, March 25. The first keel-plate of the new battleship was laid down last March.

During the next cruise of the Channel Squadron, experiments are to be made with Scottish coal and with patent fuel made from the dust of Welsh coal. On the following cruise two battleships are to make experiments with oil fuel, which has

already had a protracted trial in the *Surly*, torpedo-boat-destroyer, at Portsmouth.

An official intimation was received at Devonport yesterday that the King and Queen will visit the port and attend the launch of the battleship *Queen* on March 10; also that Her Majesty has graciously consented to name the vessel. During their visit to the west their Majesties will lay the foundation stone of the Royal Naval Cadets' College, Dartmouth.

The *London*, battleship, has concluded a 30 hours' coal consumption trial at one-fifth her power. She drew 26 ft. 3 ins. forward and 27 ft. aft, and had a steam pressure of 248 lb. in her boilers. The vacuum was 27.6 in. starboard and 27.3 in. port, and the revolutions were 65.68 starboard and 65.26 port, produced by a collective i.h.p. of 3,237. The speed was 11½ knots, and the coal consumption 1.81 lb. per i.h.p. per hour.

The Portsmouth Dockyard authorities have been directed to prepare estimates for fitting out the *Active*, cruiser, to relieve the *Urgent*, Captain D. Riddell, as receiving ship at Jamaica. The *Active* was last employed as Commodore ship of the Training Squadron, and when she had been dismantled for a refit the Training Squadron was abolished and the Cruiser Squadron substituted.

The *Amphitrite*, cruiser, Captain W. Stokes Rees, C.B., at present employed on naval relief duties, is ordered to be commissioned for service on the China station on her return to Chatham Dockyard with the paid-off crews of the *Alacrity*, despatch vessel, Commander Seymour E. Erskine, and the *Snipe*, shallow draught steamer, Lieut. and Commander Robert W. Dalgety. The *Amphitrite* will be manned by a new crew from the Medway depot.

The Admiralty have issued to Clyde shipbuilders specifications for two battleships, five armoured first-class cruisers, and two protected deck third-class cruisers. The battleships will be of 16,500 tons displacement, and the most powerfully armed in the world. The Admiralty ask that the tenders for the battleships be pushed forward, so that the contracts may be placed expeditiously. The third-class cruisers will have 3,000 tons displacement, so as to admit of greater gun power.

The *Pantome*, sloop, has returned to Sheerness from a 30 hours' steam trial at 5.7ths of her full power, which proved successful. The following are the particulars of the trial:—Pressure of steam in boilers, 216 lb.; ditto at engine, 209 lb.; vacuum—starboard, 27.7 ins.; port, 27.2 ins.; revolutions—starboard, 178.9; port, 175.6; i.h.p.—starboard, 158; intermediate, 170; low, 183; port, high, 165; intermediate, 167; low, 177; total i.h.p., 1,020; speed, 12.5 knots; coal consumption, 1.54 lb. per i.h.p. per hour. The results were considered very satisfactory. She is fitted with engines made in Devonport Dockyard, and her boilers are of the Niclausse watertube type, supplied by Messrs. Humphrys, Tennant, and Co.

At Whale Island, on the 10th ult., a sample 2-in. plate manufactured by Messrs. Cammell and Co., of Sheffield, of the type used in gun shields and in continuation of the armour of battleships and armoured cruisers from the belt to the ram, was tested under the usual conditions. Three rounds were fired from a 6-pounder quick-firing gun, and each shot, which was fired at a velocity of 1,700 ft. seconds, splashed on the plate, but there was neither crack nor penetration. The plate was then subjected to a more severe test, one round being fired from a 4-in. quick-firing gun at a velocity of 1,650 ft. seconds. Again the shot splashed on the surface, causing neither crack nor penetration, but it set up a slight bulge, which indicated a satisfactory degree of elasticity. The whole of the armour of the battleship *Queen* is being manufactured by Messrs. Cammell and Co.

The order for the laying down of the battleship *King Edward VII.* at Portsmouth during the current financial year has been cancelled, and it is understood that the ship to be laid down at Devonport on the slip from which the *Queen*, battleship, will shortly be launched will be named after His Majesty. A cruiser is to be laid down at Chatham, but no new ship will be begun at Portsmouth during the present financial year. With the work already in hand and the ships to be sent to Portsmouth from Pembroke and the private yards, there will be enough occupation for Portsmouth for quite another year. Meanwhile, the preliminary steps have been taken for erecting a new machinery factory in which all the work of the chief engineer of the Dockyard will be concentrated, but it is estimated that three years will elapse before the factory is in complete working order. The facilities of Portsmouth Dockyard are at the same time being improved by lengthening two docks which hitherto have been capable of accommodating ships up to 400 ft. in length, but which after the alterations will be available for the docking of the new armoured cruisers of 500 ft.

France.—The *France Militaire* states that the French Minister of Marine has decided that extensive alterations and repairs shall be carried out on the three cruisers *Coëtlogon*, *Troude*, and *Forbin*, which belong to the reserve, and are stationed, the first at Lorient and the two others at Rochefort. They were built at Bordeaux more than ten years ago, and have never been good for anything, only one of them, the *Troude*, being fit to put out to sea. The alterations will include the renewing of the boilers, the replacing of the wooden decks, and the modernizing of the artillery. It is expected that the alterations, which will be very expensive, will render the vessels seaworthy and of some value as warships. The battleship *Requin* has undergone extensive alterations at Cherbourg. At her preliminary trial her engines developed 6,230-h.p., against the 6,000-h.p. contracted for, and only 10 of her 12 Niclausse boilers were used. The coal consumption was 1 lb. 9.4 oz. per h.p. The full power trials of the *Requin* have been successfully carried out. The boilers were subjected to a constant pressure of 13½ to 14 kilogrammes. The engines are of 6,250-h.p., and the speed attained was 15.3 knots. The mean consumption of coal was 795 grammes per h.p. per hour. The engines worked very well. The cruiser *Jean Bart*, in reserve at Lorient, is to have her cylinder boilers replaced probably by Niclausse boilers, and an estimate is to be given for replacing her wooden decks by steel ones, as well as the bulkheads of her bunkers, which are in a very bad condition. In 1903 she is to be ready to relieve the *Isly* at Newfoundland, which will then return to undergo similar repairs and alterations.

Holland.—The Dutch Government have decided to adopt Yarrow water-tube boilers in the latest battleship now building, named the *Hertog Hendrik*, of 6,000 h.p.

Italy.—The *Italia Militare e Marina* states that three new Italian battleships of the type of the *Vittorio Emanuele* will be commenced during the current financial year. Battleship "A" will take the place of the *Benedetto Brin* on the stocks at Castellamare; "B" that of the *Regina Margherita* at Spezia; and "C" that of the *Francesco Ferruccio* at Venice. A total amount of only £68,000 has been assigned as a first instalment towards the expense of the three ships; while for the *Vittorio Emanuele* and the *Regina Elena* further instalments of £200,000 each have been assigned. The same paper further states that there are seven vessels building at Pola and Trieste for the Austrian Navy. These consist of three battleships, one cruiser, two river monitors, and a torpedo depot ship. One of the three battleships has been named the *Bamberger*, and is of the same type as the *Habsburg* and *Arpad* (length, 354 ft.; beam, 65 ft. 7 ins.; speed, 18 knots). The two others

are of a new type, with length 390 ft. 5 ins.; beam, 72 ft.; engines, 14,000-h.p.; and speed, 19 knots. Each of the two will be armed with four 9.45-in., eight 7.48-in., six 5.9-in., fourteen 2.75-in., and sixteen machine guns; also two torpedo tubes. This type of battleship will be the largest in the Austrian Navy. The cruiser will be nearly 384 ft. long, and have a speed of 21 knots.

United States.—It has been decided that the United States battleship *Illinois* shall become the flagship of the United States squadron in European waters.

MILITARY.

Lieut.-General Sir H. Le G. Geary has selected Lieut. J. A. Geary, Royal Garrison Artillery, as aide-de-camp on his staff as Governor and Commander-in-Chief of Bermuda.

Colonel Sir T. J. Gallwey has been appointed Principal Medical Officer in India, and left England for Bombay on the 29th ult.

Major-General Wynne, who has been appointed to the command of a first-class district in India, is proceeding to England by the *Briton*. General Settle will succeed General Wynne in the command of the latter's Cape Colony district.

Capt. the Hon. W. P. Hore-Ruthven (Master of Ruthven), D.S.O., is to be appointed regimental adjutant of the Scots Guards, and Capt. F. L. Adam is to be adjutant of the 3rd Battalion of the regiment.

Capt. M. D. Murray, Seaforth Highlanders, has been appointed aide-de-camp to Major-General R. B. Lane, C.B., commanding the Infantry Brigade at Malta, and Captain A. R. Lemprière, Lancashire Fusiliers, acting brigade major.

The troops serving in the British East African Protectorates, including Uganda, British East Africa, and British Central Africa, will in future be known as the King's African Rifles. Brig.-General W. H. Manning is Inspector-General of this force.

The prizes offered by the Secretary of State for War for the self-propelled lorry best adapted for military purposes have been awarded as follows:—The first prize, of £500, to the Thornycroft Steam Wagon Company, Chiswick. The second prize, of £250, to Messrs. Edwin Foden and Company, Sandbach. The third prize, of £100, to the Straker Steam Vehicle Company, London and Bristol. The War Office have purchased the lorries to which the first and second prizes have been awarded for army use, and they will, in all probability, be at once despatched to South Africa.

At the last German army manoeuvres some comprehensive experiments were carried out in the use of mechanical traction. There were in use ten different motor-cars capable of carrying from three to six persons. These were all furnished with benzine motors and were employed in the conveyance of orders and intelligence between the different commanding officers and to the advance guards. According to the *Archiv für Post und Telegraphie* the officers who conducted the experiments considered that several of the vehicles proved themselves quite equal to the military requirements. Besides the motor-cars there were, among others, two Thornycroft steam motor-trucks employed at the manoeuvres, and these gave much satisfaction in the work of supplying the troops from the magazines. The other motor-wagons for carrying loads were also driven by steam, but it was judged from the results that these would require considerable improvement before they could be accepted as suitable for practical military purposes. In the way of road traction engines, two of Fowler's engines (Malta pattern) were employed. They each weighed six tons, including water and fuel, and each dragged three of the ordinary trucks heavily laden. As long as they were on the highroad everything went well, but difficulties arose when they turned out to the soft ground where the men bivouacked. Here the engine had first to go alone, and then, acting as a stationary engine, drag the trucks one by one over the ground by means of a wire rope. The Scott "tractor," already largely in use by the French Government, did not stand the test so well.

For the use of these tables the following explanation is necessary:—The figures in heavier type represent either of the columns beside it, as the case may be; viz., with hectares and acres in the first set of columns, 1 acre=0.405 hectare, and vice versa, 1 hectare=2.471 acres, and so on.

STATISTICAL NOTES.

United Kingdom.—TRADE IN 1901.—The following tables, taken from the Board of Trade returns, show a summary statement of the foreign trade of the United Kingdom for the year 1901, as compared with 1900:—

TWELVE MONTHS ENDED 31ST DECEMBER.

I.—IMPORTS FROM FOREIGN COUNTRIES AND BRITISH POSSESSIONS.

	Twelve months ended 31st December.		+ Increase. — Decrease.
	1901.	1900.	
	£	£	£
I. Animals, living (for food)	9,400,033	9,622,319	—222,286
II. (a) Articles of food and drink, duty free	162,949,666	156,090,088	+6,859,578
(b) Articles of food and drink, dutiable	47,595,501	49,230,529	—1,635,028
Tobacco, dutiable	4,819,473	4,799,417	+20,056
III. Metals	30,787,452	33,195,391	—2,407,939
IV. Chemicals, dyestuffs, and tanning substances	6,129,559	5,560,793	+568,766
V. Oils	11,030,606	11,033,320	—2,714
VI. Raw materials for textile manufactures	79,401,772	77,347,363	+2,054,409
VII. Raw materials for sundry industries and manufactures	57,954,510	65,079,691	—7,125,181
VIII. Manufactured articles	93,609,754	93,225,005	+384,749
IX. (a) Miscellaneous articles	17,298,198	16,771,621	+526,577
(b) Parcel post	1,262,462	1,119,626	+142,836
Total value	522,238,986	523,075,163	—836,177

NOTE.—Sugar and other cognate articles became liable to duties on the 19th April, 1901, and are included in Section II. (b) of the above table.

II.—EXPORTS OF BRITISH AND IRISH PRODUCE AND MANUFACTURE.

	£	£	£
I. Animals, living	742,499	901,843	—159,344
II. Articles of food and drink	14,884,915	13,621,755	+1,263,160
III. Raw materials	33,377,644	41,879,009	—8,501,365
IV. Articles manufactured and partly manufactured, viz.:—			
(a) Yarns and textile fabrics	103,471,561	102,212,400	+1,259,161
(b) Metals and articles manufactured therefrom (except machinery and ships)	39,413,762	45,346,909	—5,933,147
(c) Machinery and millwork	17,855,335	19,619,784	—1,764,449
(d) Ships, new (not registered as British)	9,159,876	8,587,710	+572,166
(e) Apparel and articles of personal use	10,940,060	10,394,200	+545,860
(f) Chemicals and chemical and medicinal preparations	8,942,109	9,262,519	—320,410
(g) All other articles, either manufactured or partly manufactured	38,068,759	36,414,067	+1,654,692
(h) Parcel post	3,642,369	2,951,800	+690,569
Total value	280,498,889	291,191,996	—10,693,107

III.—EXPORTS OF FOREIGN AND COLONIAL PRODUCE.

	£	£	£
Total value	67,846,843	63,181,758	+4,665,085

Fertile Canada.—A correspondent sends us a few sample leaves of tobacco grown in the open air at Prince Albert, on the banks of the Saskatchewan river, in the North-West Territories of Canada. "Many people," the sender says, "are of opinion that this part of our Empire is cold, unproductive, and inhospitable. I trust the accompanying evidence may afford some proof that such is not the case. On November 1 violets were growing in profusion in our gardens here, and to-day, the 13th, we have beautiful sunshine and clear bracing air. Since last April there have been long sunny days, cool nights, generous rains, and, as a result of such providential beneficence, along with a remarkably productive soil and the industry of a comparatively limited population, there are over 60 million bushels of wheat for export from the Canadian West this year. This land truly is destined to be the granary of the Empire. In the North-West Territories alone, consisting of Alberta, Assiniboia, and Saskatchewan, we have 300,000 square miles of land of unsurpassed fertility. A square mile contains 640 acres, so the above area contains about 192 millions of acres—an enormous agricultural section. If a settler's taste is for ranching, he can go to the foothills of the Rocky Mountains in Alberta; if wheat-growing, mixed farming, dairying, cattle-raising, etc., are more to his choice, then Eastern Assiniboia, Northern Alberta, and the great Saskatchewan valley are open to him. In Saskatchewan alone there are over 100,000 square miles of splendid rich soil open for settlement. The new trans-continental railroad—the Canadian Northern—is being pushed through the Saskatchewan valley on towards Alberta, the Rockies, and the Pacific Ocean. This will be a great thoroughfare, with connections affording communication from sea to sea, from Atlantic to the Pacific. Every settler can get 160 acres of land free, and thus becomes a landowner for himself. Prospective emigrants from the old land should look carefully into the prospects and capabilities of the Canadian North-West. Here is a land where every man of energy can make a home and lay up riches. He lives under the old flag, enjoys the liberty of British institutions, and the protection of British laws."—*Times*.

Telegraphic Address: "PACKLESS" MANCHESTER. A.B.C. CODE USED.

"KARMAL" PACKING NEEDS NO OIL OR TALLOW. LUBRICATING PROPERTIES. NEVER CEASE. NEVER CHARS OR BECOMES HARD. SUITS HOT COLD WATER. WILL STAND ANY PRESSURE OF STEAM OR DEGREE OF HEAT. NEVER MELTS OR BURNS. THE BUYER HAS THE SATISFACTION OF USING ALL UP.

SEND FOR CIRCULARS & TESTIMONIALS.

The following Pamphlets and Papers may be had gratis upon application in the Department:—

Paper on "Agricultural Resources of the Coast Lands of British East Africa," read by Mr. W. W. A. Fitzgerald, at the Imperial Institute, on January 20th, 1894.
Paper on "New Brunswick Past and Present," by M. C. A. Duff Miller.
Catalogue of the Queensland Section of the Imperial Institute.
Quarterly Circulars of the Emigrants' Information Office.
Emigration Pamphlets—"Where to go to Better Yourself."
Annual Report of the British Women's Emigration Association.

A collection of Hand-books and pamphlets (many of them illustrated) may be consulted in the Department. Duplicates of some are available for distribution. They embody much officially published recent information upon the industries, agriculture, natural resources and mining prospects of the principal British Colonies, courteously supplied by the Agents-General for the following Colonies, viz.:—New South Wales, Victoria, South Australia, Queensland, Western Australia, Tasmania, New Zealand, and Natal. Included in the collection are:—

NEW SOUTH WALES.	
Picturesque New South Wales. Forty Years of Progress. The Mining Industry. Timber Resources.	Agriculture. The Fauna. Hand-book, with Map. The Climate.
VICTORIA.	
An Australian Colony (The Government Hand-book). Hand-book of the Land Act.	Miner's Hand-book. Abstract of Statistics.
SOUTH AUSTRALIA.	
The Province of South Australia (The Government Hand-book).	Year-Book of South Australia. Mines Record.
QUEENSLAND.	
Queensland Woods. Land Act Regulations. Some Queensland Goldfields. Mining Regulations.	List of Towns in the Colony. Work and Wealth of Queensland. Year-Book of Queensland. Guide to Queensland.
WESTERN AUSTRALIA.	
The Forests of Western Australia and their Development. Year-Book of Western Australia. Settler's Guide (Parts 1 to 6). Western Australia: its Position and Prospects.	Geological Survey Bulletins. Hand-book of Western Australia, 1881-1890. Classification Rates and Regulations of Government Railways.
TASMANIA.	
Mining Regulations. Hand-book of Tasmania.	Mineral Industry. Crown Lands Guide.
NEW ZEALAND.	
New Zealand Official Year-Book. Report of Department of Agriculture. Papers and Reports relating to Minerals and Mining, 1898. Statistics of New Zealand, 1898 (Blue Book). Railways Statement, 1899.	Report of the Department of Lands and Surveys, 1898-99. New Zealand Mines Record's Annual Review of Gold-Mining Industry. Tours and Excursions.
NATAL.	
Hand-book.	

CANADA.

The following Pamphlets dealing with Canada will be furnished free of charge upon application:—

- Official Hand-books of the Dominion of Canada.
 - Part I.—General Information about Canada.
 - „ II.—The Maritime Provinces: Quebec and Ontario.
 - „ III.—Western Canada: Manitoba and the Territories.
 - „ IV.—British Columbia.
- The Report of the Department of Trade and Commerce, 1900.

The Poste Restante is open every week-day for receipt and delivery of letters and parcels. Letters addressed to initials only are not received, except in reply to notices in the JOURNAL, under "Requirements" Registry. The General Post Office Pillar Box is cleared daily twelve times, between 10.10 a.m. and midnight. Light refreshments only are, for the present, provided in the Fellows' Rooms and at the bar of the Ceylon Kiosk.

SCIENTIFIC AND TECHNICAL DEPARTMENT.

The Scientific and Technical Department of the Institute has been established to acquire information by special enquiries and by experimental research, technical trials and commercial valuation regarding new or little known natural or manufactured products of the various Colonies and Dependencies of the British Empire and of foreign countries, and also regarding known products procurable from new sources, and local products of manufacture which it is desired to export. This work is carried out with a view to the creation of new openings in trade, or the promotion of industrial developments.

In the extensive and well-equipped series of Research Laboratories occupying the West Corridor of the Second Floor, a staff of skilled Chemists, under the direction of Professor Wyndham R. Dunstan, M.A., F.R.S., carry out the investigation of the chemical constitution and properties of new dye-stuffs, tanning materials, seeds and food-stuffs, oils, gums and resins, fibres, timbers, medicinal plants and products; animal products, minerals and ores, soils, cements, and various other products, with a view to their commercial utilization. Whenever necessary these materials are submitted to special scientific experts, by whom they are made the subjects of particular investigation or practical tests. Reports are also obtained from technical or trade-experts in regard to the probable commercial or industrial value of any such products, whilst full information is collected from official or other trustworthy sources regarding the probable extent and cost of available supplies. All materials requiring scientific or technical examination, or commercial valuation, should be submitted to the Institute for examination either by, or through, the Foreign Office, the Colonial Office, the India Office, or the Board of Trade, or through the Colonial or Indian Government Authorities. Requests for the examination of such materials may also be submitted by Public Commercial Bodies and Institutions of the respective Colonies and Dependencies, or by the Representatives of H.M. Government in foreign countries.

COMMERCIAL INTELLIGENCE DEPARTMENT.

The Office of this Department, in the West Corridor, First Floor, is open daily from 10 a.m. to 5 p.m. (on Saturdays till 1 p.m.), for the purpose of answering enquiries and supplying information relating to the Commerce (Export and Import) and Industries of India and the Colonies. Applications may be made personally or by letter. Special information may be obtained from the Curators in charge of the Indian and of certain Colonial Collections. Arrangements have been made for the translation for mercantile firms of Trade Circulars, Price-Lists, and Catalogues into any Foreign Language, including the conversion of weights, measures and coinages, etc., at cost price, and application for such may be addressed to this Department.

COMMERCIAL COLLECTIONS.

The Galleries containing the **Colonial and Indian Collections**, and the **Public Commercial and Industrial News Room**, are open for free inspection by the public daily, *except Sundays, and any days specially notified*, from 11 a.m. until 5 p.m. Every information concerning the products, their supply, etc., can be obtained on application to the Curators of the Indian and Ceylon, Canadian, and South African Sections, to the general Curator, and to the Commercial Intelligence Department.

CITY BRANCH OF THE IMPERIAL INSTITUTE.

The City Branch of the IMPERIAL INSTITUTE, at 112, Cannon-street, E.C., is open to Visitors on week-days from 10 a.m. till 5 p.m. The Branch includes a News Room, supplied with many British and Foreign Commercial Publications, Market Reports, etc., and an Enquiry Office in telephonic communication with the Commercial Information Office of the Imperial Institute. The News Room and Enquiry Office are *free* to Fellows of the Institute; other persons are admitted on payment of £1 annually.

Subscribers are entitled to inspect, *free of charge*, any maps or charts included in the Map Room collection at the Imperial Institute, South Kensington, and to consult any works, or official papers, included in the Institute Library.

The Information Department will undertake to obtain analytical or other examinations of samples by competent Experts, upon payment, by persons submitting them, of the usual professional fees, to be previously specified, and agreed to by the applicant. (*For further information see page 76*).

THE NORTHBROOK SOCIETY.

The Northbrook Society is affiliated to the Imperial Institute, and has a special room allotted for the exclusive use of its members in the Institute buildings. Its primary objects are to watch over and promote the interests of natives of India, and to provide a system of guardianship or supervision over such as are sent to Europe for education. The Society is controlled by a committee consisting of an equal number of Governors of the Imperial Institute and members of the Society, presided over by the Earl of Northbrook. It possesses an excellent library. Indian members, who pay no subscription to the Society, have the especial advantage of becoming Fellows of the Institute at half the usual subscription payable by the ordinary Fellows. Applications for membership of the Society should be addressed to the Secretary of the Northbrook Society, Imperial Institute, London, S.W.

ADMIRALTY CHARTS.

THE LATEST EDITIONS OF CHARTS, PLANS & SAILING DIRECTIONS, PUBLISHED BY THE ADMIRALTY
CAN BE OBTAINED FROM

J. D. POTTER,
ADMIRALTY AGENT BY APPOINTMENT,
145, MINORIES, LONDON, E.

OFFICIAL CATALOGUE OF CHARTS (340 pages), 1s.
An Abridged Catalogue of Charts and Nautical Books (free on application).

Branch Establishment—11, KING STREET, TOWER HILL, E.

NOTICE.—For the early information and convenience of Shipowners, Captains, and others, ALL NEW ADMIRALTY CHARTS that may be published from time to time are noted every Monday in the *Shipping Gazette* and *Lloyd's List* on page 7; in the *Shipping Gazette* and *Lloyd's List Weekly Summary* every Friday, on page 1; and in the *Lloyd's Weekly Shipping Index* every Friday, on page 3 of Cover. The new and corrected Admiralty Charts are also noted in the following weekly and monthly journals:—*The Syren*, *The Nautical Magazine*, *The Geographical Journal*, *The Shipping World*, *The Mariner*, *THE IMPERIAL INSTITUTE JOURNAL*, and *The Steamship*, etc., etc.
Copies of the CHARTS can be obtained by applying to J. D. POTTER.

LIVERPOOL, ENGLAND.

FINANCIAL AND COMMERCIAL RETROSPECT.

UNITED KINGDOM.—The Board of Trade returns for January compared fairly well with those for the same month of last year. The imports were worth £50,131,348, thus showing an increase of £4,143,832, or 9.0 per cent. The classes of articles in which improvement was most noticeable were articles of food and drink, and raw materials for textile manufactures. Live cattle fell off in numbers by 11.6 per cent., and the reduction of value was almost precisely proportionate, but sheep and lambs improved by 79.3 per cent. in quantity and 82.7 in value. In bacon and beef there was little alteration. The value of the butter imported reached the huge value of £1,897,554, representing an increase of 10.9 per cent. in quantity and 8.2 per cent. in value. Eggs, worth £477,227, improved 14.1 per cent. in number, and over £70,000 in value. In cereals, wheat, with an increase of 10.5 per cent. in amount, was better in value by 9.4 per cent., but wheat flour was less by 1.7 per cent. in the latter respect, though its amount was slightly greater. Barley again for an increased amount of 12.5 per cent. only improved in value to the extent of 1.6 per cent., while with oats this condition was reversed, for an increased importation of only 3.1 per cent. was accompanied by an increase in value of 23.7 per cent. Indian corn increased by 812,403 cwt. (13.6 per cent.), and its value rose by £504,402 (37.1 per cent.), Russia, Argentina and Roumania sending larger quantities, though the shipments from the United States showed a diminution of nearly five million cwt. In refined sugar, possibly in anticipation of an increased duty, there was a rise of 1,933,405 cwt., the value being enhanced by £903,857, and raw sugar increased by 750,360 cwt. in quantity and £164,439 in value. In tea there was a slight decline of 2 per cent. both in quantity and value, but coffee improved 103.4 per cent. in the former respect and 68.4 in the latter. With regard to raw materials for textile manufactures, there was an increase in the imports of cotton from Egypt and the United States, though less was sent by the British East Indies; the result was a net increase of 751,863 cwt. (36.9 per cent.) in quantity and of £1,168,385 (20.4 per cent.) in value. Sheep's wool also largely increased, owing to extensive shipments from Russia, Turkey, France, British South Africa and Australasia, and hemp was better by 60.4 per cent. in quantity and 118.6 per cent. in value. Jute was greater in amount though less in value, while flax fell off over 30 per cent. in both respects. The exports of British and Irish produce, valued at £24,254,574, showed a decrease of £498,957 or 2.0 per cent. The loss in the value of coal is more than sufficient to account for the reduction, for though the amount exported was only 32,461 tons less than in January of last year, the diminution in value was £521,046. Iron and steel increased by 18,237 tons (8.8 per cent.), but the value was £82,602 less. Machinery also declined by £39,117 (2.6 per cent.), although more locomotives were sent to India, Australia and British South Africa. New ships increased by £134,573. In cotton yarn and twist there was an increase of 1,062,900 lb. in quantity, but the value was less by £65,546 (9 per cent.). The same was true of cotton piece-goods, though the fall in value was less—only 0.3 per cent. or £19,263; the quantity, however, increased by 5.2 per cent., or over 25 million yards, owing to a heavier demand from Egypt, Japan, Brazil, Uruguay, Argentina, British South Africa and China; the last country alone accounted for an increase of 35 million yards, but, on the other hand, smaller shipments were sent to India, British West Africa, Chili and the United States. Jute yarn rose 55.2 and 48.2 per cent. in quantity and value, but the piece-goods were less by 4.2 and 3.8 per cent. respectively. In linen yarn there was a decrease of 24.9 per cent. in amount and 14.7 per cent. in value, but the piece-goods were better by 8.1 per cent. in the former respect and 7.4 per cent. in the latter. Sheep's wool improved 20.6 per cent. in quantity and to a less extent in value, but woollen and worsted yarn was worth 5.3 per cent. less, though its amount was 7.1 per cent. greater. Woollen tissues slightly improved in both respects, but worsted tissues were slightly worse. In spirits there was the considerable advance of 17.7 per cent. in quantity and 21.8 per cent. in value. Refined sugar was nearly a third less. Soda compounds were worth 12.8 per cent. more, and chemical manures improved by 22.4 per cent. in quantity, though their value did not rise proportionately. The re-exports of foreign and colonial merchandise were worth £5,340,446, an increase of £289,139, or 5.7 per cent. over the figures for the same month of last year.

The results obtained by English railways in the December half of last year were of a somewhat uneven character. Among the big lines, two (the Great Northern and Great Eastern), increased their dividends by $\frac{3}{4}$ per cent., one (the Great Western), by $\frac{1}{2}$ per cent., and one (the Lancashire and Yorkshire), by $\frac{1}{4}$ per cent. The London and North Western, the Midland, and the London, Brighton and South Coast, maintained the same rate, while the London and South Western had to diminish its distribution by $\frac{1}{4}$ per cent., the South Eastern by $\frac{5}{8}$ per cent., and the North Eastern by 1 per cent. The case of the last line is rather peculiar. During the half-year it reduced its train-mileage by 483,000 miles, yet its working expenses increased by £45,983, and this, coupled with a reduction in gross revenue of £60,943, resulted in a decrease of £106,926 in net revenue. In contrast to this unhappy performance, the Great Northern reduced its train-mileage by almost exactly the same amount, but succeeded in saving £38,278 in working expenses and in increasing its gross revenue by £25,055. Similarly, the North Western, with a train mileage smaller by 692,000 miles, spent £32,809 less on working expenses, and at the same time increased its traffic receipts by £39,270. The Great Central, too, was successful in measures of economy, for by saving 107,000 miles in train-mileage and cutting down its working expenses by £60,147, it obtained an increase in its net revenue of £77,047.

The Lancashire and Yorkshire, again, decreased its mileage by 310,000 miles, and improved its net revenue by £36,357. The Great Western's results were the best of all. It ran 154,000 miles more (part of the increase being, doubtless, explained by the fact that it had 28 miles more of line in use), and its working expenses rose by £43,974, but its receipts were so much higher that its net revenue showed an improvement of £114,105. The Midland does not appear to have joined in the fairly wide-spread attempt to diminish train-mileage, for in this respect it reports an increase of 899,000 miles, though it had only 2 more miles of line to work; still its working expenses did not increase inordinately, and a larger gross revenue enabled it to improve its position by £56,610.

For the Irish railways the half-year was not very brilliant. Only one of them, the Belfast and County Down, managed to increase its dividend, by $\frac{1}{2}$ per cent.; two others, the Belfast and Northern Counties and the Great Northern, maintained it at the same rate, but the shareholders of the Great Southern and Western and of the Midland Great Western had to put up with a reduction of 2 and 1 per cent. respectively. As usual, the Dublin, Wicklow and Wexford paid nothing.

The recent issue of £3,000,000 three per cent. London County Consolidated Stock was applied for to the extent of £27,256,860. Of the total applications, 2,991 in number, 96 were for sums between £500,000 and £100,000, while there were six applications for £20, and three for £10. Small applications up to £200 were allotted in full, while applicants for larger amounts were dealt with *pro rata*, though no allotment of less than £200 was made.

COLONIES.—The gold output of the mines working on the Witwatersrand in January was 70,340 oz.; in December the amount was 52,897 oz. The total yield of Victoria in January was 39,091 oz., of New South Wales 46,235 oz., of Queensland 53,100 oz., and of New Zealand 32,860 oz. In West Australia 79,926 oz. were entered for export, and 88,233 oz. were received at the Perth mint for coinage, the total thus being 168,159 oz.

The following table shows the variations which have occurred in certain Colonial Government securities during the past three months:—

	30th Dec.	28th Jan.	25th Feb.
Canada 3 per cent.	101 $\frac{1}{4}$ —101 $\frac{3}{4}$	101 $\frac{1}{4}$ —101 $\frac{3}{4}$	101—101 $\frac{1}{2}$
Cape 3 per cent.	95—95 $\frac{1}{2}$	94—94 $\frac{1}{2}$	96—96 $\frac{1}{2}$
Natal 3 per cent.	94—95	93 $\frac{1}{2}$ —94 $\frac{1}{2}$	93—94
New S. Wales 3 per cent.	95 $\frac{1}{2}$ —96	95 $\frac{1}{4}$ —96 $\frac{1}{4}$	96 $\frac{1}{2}$ —97
New Zealand 3 per cent.	94 $\frac{1}{2}$ —95	94 $\frac{1}{2}$ —95	95—95 $\frac{1}{2}$
Queensland, 3 per cent.	93 $\frac{3}{4}$ —94 $\frac{1}{4}$	93 $\frac{3}{4}$ —94 $\frac{1}{4}$	94 $\frac{3}{4}$ —95 $\frac{1}{4}$
South Australia 3 per cent.	93 $\frac{1}{4}$ —93 $\frac{3}{4}$	93—93 $\frac{1}{2}$	93 $\frac{1}{2}$ —94
Tasmania 3 $\frac{1}{2}$ per cent.	103 $\frac{1}{2}$ —104 $\frac{1}{2}$	103 $\frac{1}{2}$ —104 $\frac{1}{2}$	103 $\frac{1}{2}$ —104 $\frac{1}{2}$
Victoria 3 per cent.	96 $\frac{1}{4}$ —96 $\frac{3}{4}$	96 $\frac{1}{2}$ —97	96 $\frac{1}{2}$ —97
West Australia 3 per cent. (May—Nov.)	92 $\frac{1}{2}$ —93 $\frac{1}{2}$	92 $\frac{1}{2}$ —93 $\frac{1}{2}$	93 $\frac{1}{4}$ —93 $\frac{3}{4}$

INDIA.—A number of the mines working the Kolar goldfield, including the Balaghat, Champion Reef, Mysore, Nundydroog and Ooregum, have come to an agreement with the Mysore Government (subject to the approval of the Government of India) that the leases under which they work shall be renewed from March, 1910, so as to ensure them a tenure of their mining rights for 38 years from the present time. In addition to the present royalty, the mines will be required to pay 2 $\frac{1}{2}$ per cent. on dividends declared after March, 1910.

The following table shows the fluctuations which have occurred in certain Indian railway companies' securities, during the last three months:—

	30th Dec.	29th Jan.	26th Feb.
Bengal and North Western	127—131	130—134	131—135
Bengal-Nagpur Gua. 4 per cent.	106—110	105—109	103—107
Bombay, Baroda & Cent. India	171—176	155—165	157—163
Indian Midland 4 per cent.	106—110	104—108	103—107
Madras Grntd. 5 per cent.	134—138	136—140	133—137
South Indian 4 $\frac{1}{2}$ per cent. Deb.	136—141	137—142	138—143
Southern Mahratta 3 $\frac{1}{2}$ per cent.	107—111	106—109	106—109

FOREIGN COUNTRIES.—The returns of French foreign trade for last year show that the imports reached a value of over 188 $\frac{1}{2}$ millions sterling against rather less than 188 millions in the preceding year, while the exports at 166 $\frac{1}{2}$ millions were more than 2 $\frac{1}{2}$ millions better. Great Britain was far and away France's largest source of supply, sending over 26 $\frac{1}{2}$ millions of the imports. The United States came next on the list with 19 $\frac{1}{4}$ millions, followed by Germany with nearly 16 $\frac{3}{4}$, Belgium with nearly 15 $\frac{1}{2}$, and Argentina with over 14 $\frac{1}{2}$ millions. In the exports the lead of Great Britain was still more marked. She took French produce to the extent of 50 $\frac{1}{2}$ millions, and was thus more than twice as good a customer to France as Belgium, which came next on the list with 23 $\frac{3}{4}$ millions. Germany contributed goods to the value of nearly 18 $\frac{1}{2}$ millions, and the United States followed next, but a long way behind, with 9 $\frac{1}{2}$ millions. Of the total value of the imports received from England, more than a quarter was due to coal, which in 1901 was worth £7,632,000 and in 1900 £8,146,000. The next largest item was wool which, worth £1,633,560 in 1900, jumped to £3,623,560 last year. Machinery came third with a value of £1,322,000 (a decrease from £1,603,000 in 1900) and woollen goods were fourth with £1,088,000. On the other hand, of goods sent to England by France, silks, worth nearly 5 $\frac{1}{2}$ millions, formed the largest item. Then followed woollens with £4,600,000, millinery and artificial flowers with £4,314,000, raw sugar with £3,910,000, wines with £2,256,000, and clothing with £2,031,880. The spirits England bought from France were worth £1,185,000 and the refined sugar £1,092,000. One interesting, though minor, item in the exports is that of automobiles. In 1899 the exports of these from France to all countries were valued at £170,360, in 1900 at £376,680, and in 1901 at £631,280, England being apparently the best customer. The total entries of ships with cargo into French ports fell from 18,360,448 tons in 1900 to 18,199,003 in 1901, the French tonnage rising from 4,678,506 tons to 4,703,209, while the foreign fell from 13,681,942 to 13,405,794. In the clearances, however, there was an increase from 12,804,292 to 13,125,730 tons; both French and foreign tonnage shared, the former increasing from 4,332,585 to 4,503,131 tons, and the latter from 8,561,707 to 8,622,599.

AGRICULTURAL RETROSPECT.

UNITED KINGDOM.—The most notable feature of the weather during the present winter is the deficiency in the rainfall. Since January 1st the rainfall is behind the average by nearly two-and-a-half inches, and springs and wells and other sources of water supply are accordingly running low. It follows, then, that farmers have the prospect of either a dry spring or, if the arrears of precipitation are to be made up to any extent, of wet soils when tillage work should be actively proceeded with. The short period of frost during the middle of February did not injuriously affect the young crops, but neither was it sufficiently protracted to allow opportunities for carting manure on to the land, which is perhaps the work most in arrear at the present moment. The absence of severity in the weather has been propitious for the lambing flocks, and reports from the pens are for the most part favourable.

A series of experiments on the destruction of charlock amongst corn crops was carried out last season in various parts of Lancashire by Mr. Frank P. Walker, lecturer on agriculture at the Harris Institute, Preston, who has prepared an instructive report on the results. This yellow-flowered, cruciferous plant, often called wild mustard, is known in Scotland as skellocks, in Ireland as preshaugh, and amongst its other local names are ketlock, kedlock, and yellow weed. The direct mischief occasioned by charlock is that, by its rapid growth, it quickly overshadows the young growing corn; in a dry season it seizes the soil moisture which the corn crop needs, and it produces its flowers and seeds by using up the plant food which should have gone to nourish the corn crop. The result is a crop much lighter in grain and shorter in straw than it should have been, and a new crop of charlock seed ready to repeat and extend the mischief in the succeeding season. Indirectly, charlock is mischievous in that it encourages the turnip "fly" or flea beetle, providing it with food until its favourite crops, the turnip and swede, are ready for it; and also that it harbours the slime fungus, which is the cause of the disease known as club-root, or finger-and-toe, in cabbages, turnips, and allied cruciferous crops. A solution of sulphate of copper (blue vitriol) or of sulphate of iron (green vitriol) sprayed upon young charlock plants will effect their destruction. Of these two agents, however, Mr. Walker sums up strongly in favour of sulphate of copper—it is more destructive in its effects upon charlock, and it is a far pleasanter material to have to handle. The machine used for spraying was Strawson's No. 2 Charlock Destroyer, which worked most satisfactorily and produced an exceedingly fine spray. The cost of spraying per acre varies according to the proximity of water supply, the cost of material, and the expenses of labour in each particular district. Under favourable conditions, and using 15 lb. of sulphate of copper at 30s. per cwt. per acre in 50 gallons of water, the cost should be about 3s. 4d. to 3s. 6d. per acre. Whilst spraying with sulphate of copper injures and eventually kills the rough-leaved charlock, it does no harm to the smooth-leaved plants constituting the corn crops which are so liable to become infested with charlock. It is, however, a familiar and an approved practice to sow grass and clover seeds in a corn crop so that, when the latter is harvested, the young crop of grass and clover may already have made some amount of growth. Is spraying against charlock inimical to these grass and clover seeds? This is a question of high practical importance, and the answer, in general terms, is in the negative. Half-a-dozen plots were specially set apart for experiments upon this point, and, though in some cases the clover and grass may receive a check, it appears to be always of a temporary character, the final results being strongly in favour of the practice of spraying.

In the course of his inaugural address to the students at the Colonial College, Hollesley Bay, Suffolk, Professor W. J. Malden, the new principal, dealt with the subject of live stock as it affects the colonies, as well as farming at home. He referred to the need that must arise for the colonies to adapt themselves to the changed conditions occasioned by the low price of wool since the modern glut assumed a chronic form, and since the cold storage of meat has passed into the domain of successful practice. It is highly desirable that intending colonists should understand the laws of breeding, so that in endeavouring to bring about what might be regarded as necessary changes in breed the losses which error would involve might be prevented. Students should learn the characteristics of the various British breeds, in order to be able to judge of the capabilities of such breeds in other lands and beneath other skies. It is a great mistake to go abroad without such knowledge, as it is only in England that it can be efficiently acquired. The large number of students in the college from distant countries shows the value which people in

the colonies and in foreign countries place upon a thorough grounding in the practices of English farming, undoubtedly the most skilled farming in the world.

COLONIES.—Mr. W. Willcocks, C.M.G., one of the leading authorities on irrigation in Egypt, and the original designer of the great Nile reservoir at Assuan now approaching completion, proceeded some months ago to SOUTH AFRICA, at the invitation of Lord Milner, in order to study the question of irrigation in the Cape Colony, the Orange River, and the Transvaal. The report which he addressed to the High Commissioner, under date Johannesburg, November 6, 1901, on completion of his mission, has now been issued. Except in the extreme south-western corner of Cape Colony, agriculture has scarcely been attempted, except on the most primitive lines, and on the most insignificant areas. Farmers to-day trek from the high veld to the low veld and back again, with the seasons, just as the wandering Arabs of the desert have done for centuries. The reason for this want of development of the agricultural wealth of the country, and the consequent acute stage of the poor white question, lies in the fact that the rainfall of the three colonies, with the exception of the extreme south-west corner, is not only erratic and uncertain at the times most opportune for sowing, but is constant and heavy in autumn. Autumn again is quickly followed by a very severe and frosty winter without a particle of moisture in the air. When rain is wanted it is generally not there, when it is not wanted it is invariably present. For countries so situated the only possible means of development lie in the storage of water when it is present and not needed, and its utilization when it is needed. Agriculture without irrigation is generally impossible in the new colonies. If these countries are ever to develop their immense agricultural wealth, the first step must be to proclaim the countries themselves as arid or semi-arid regions, and legislate accordingly. In many countries statesmen have considered that irrigation works should be left to individuals and concessionaire companies. Such works, when of any magnitude, have been, as a rule, conspicuous failures in the hands of companies, which have been impatient to realise profits and which have, in consequence, forced their engineers to overtax their reservoirs and canals in their early and undeveloped stages. With works carried out by States, the results have, on the contrary, been decidedly encouraging. Having served for 12 years in the Indian Irrigation Department, and 18 years in Egypt, Mr. Willcocks naturally considers the execution of important irrigation canals as the first works which an enlightened Government should carry out in an arid or semi-arid country. Not only do well-conceived and well-executed irrigation works bring in a direct benefit to the State if allowed to develop on slow and natural lines, but they also bring in all the indirect benefits which a State reaps from increased wealth of every kind. If this is the case in ordinary countries, much more is it the case in South Africa, where there are special difficulties, which can be solved by irrigation alone. In young countries where the extension and amelioration of the arable land provide outlets for the ever-increasing population, the poor white question never reaches the acute stage it has already reached in South Africa with its pastoral population. The acuteness has been aggravated in the country by the fact that the poor whites of European parentage consider manual labour degrading when carried on in competition with black labour. Fortunately, there is one kind of manual labour which the poor white considers as becoming, and that is agricultural labour. While the country is given up to stock-farming the poor white has but little outlet for his energies in the only direction in which his sentiments allow him to exercise them. If, however, the State were to carry out irrigation projects, employing labour-saving machinery and white labour, and then to take up along the canals such tracts as were suitable for agriculture, it would first find work for the poor whites and eventually settle them on the land with occupancy rights. Such tenants would pay a fixed rent to the landlord and a fixed water-rate to the Government. Mr. Willcocks suggests that part of the profits of the mines might be equitably and usefully invested in irrigation works for the permanent development of the country. He gives a detailed description of the different sections of the three colonies he has visited and the most suitable measures for providing for their irrigation, and also makes valuable suggestions with regard to the raising of revenue for the purposes of irrigation expenditure.

The investigations conducted under the auspices of the Dominion Department of Agriculture in order to ascertain which are the varieties of the different farm crops best suited to the soils and climate of CANADA have now been in progress for seven years, and commendable promptitude has been shown in the issue of the report for 1901, so that it may be in farmers' hands before they begin their seeding operations in the approaching spring. The experiments are carried out not only at the central experimental farm, Ottawa, but at the provincial experimental farms situated respectively at Nappan in Nova Scotia, at Brandon in Manitoba, at Indian Head in the North-West Territories, and at Agassiz in British Columbia, these constituting with the central institution a chain of experimental farms stretching across the country from east to west. The average yields of oats per acre per annum over the last six or seven years have been 61 bushels at Ottawa, 63 at Agassiz, 69 at Nappan, 84 at Brandon, and 90 at Indian Head. The 12 varieties of oats out of upwards of 60 tried which have produced the largest average annual crop at all the stations are—in descending order—Banner, American Beauty, Mennonite, Holstein Prolific, Bavarian, Buckbee's Illinois, Golden Beauty, Columbus, Golden Giant, Early Golden Prolific, Abundance, American Triumph. The average yield per acre ranged from 76 bushels for Banner down to 70 for American Triumph, and the average over all the 12 varieties was 72 bushels per acre. Of two-rowed barley the average yield per acre per annum over six or seven years has been 37 bushels at Agassiz, 41 at Nappan, 43 at Ottawa, 44 at Brandon, and 55 at Indian Head. The six varieties which have given the best average results at all the farms together have been French Chevalier, Beaver, Danish Chevalier, Canadian Thorpe, Nepean, and Newton, the average yield per acre per annum ranging from 46 bushels for the first-named down to 42 bushels for the last. The general average yield of all six has been 43 bushels per acre per annum. Of six-rowed barley the average yield per acre per annum over six or seven years has been 37 bushels at Agassiz, 46 at Nappan, 49 at Ottawa, 51 at Brandon, and 58 at Indian Head. The six varieties which have afforded the best average annual yields at all the farms together have been

Mensury, (51 bushels), Odessa, Trooper, Common, Royal, Oderbruch (45 bushels). The general average yield of all six has been 47 bushels per acre per annum. Out of over 70 varieties of spring wheat tried, the 12 which have yielded the biggest average crops at the individual stations have afforded an annual average of 25 bushels per acre per annum at Ottawa, 28 at Agassiz, 32 at Nappan, 36 at Brandon, and 42 at Indian Head. The 12 varieties which have given the highest average annual yield per acre at all the farms together have been Preston, Wellman's Fife, Monarch, Goose, Huron, Red Fife, White Fife, Hungarian, White Connell, White Russian, Rio Grande, and Pringle's Champlain, the yields ranging from 33 down to 31 bushels. The general average yield of all 12 has been 32 bushels per acre per annum. Similar experiments have been made with maize, peas, turnips, mangels, sugar beets, carrots, and potatoes.

A suggestion has been received by the QUEENSLAND Department of Agriculture for the adoption of the eland as a profitable animal for grazing. The hopelessness of successful cattle-raising in the scrub-covered country between the Overflow and the Bogan river, where neither fire nor water will eradicate the scrub, has suggested the idea of putting upon these lands an animal which will eat the scrub, whose natural food it is, who will fatten on it, will not require much water, and is able to travel for what it wants. The eland, it is claimed, is such an animal. This antelope, when fully grown, is as large as a two-year-old shorthorn, and has more the appearance of a high-bred bullock than an antelope. It can live on the hardest fare, and soon grows fat on good pasture. It is further claimed, as an advantage, that it becomes quite tame, and is easily acclimatized. In Africa the eland feeds on various kinds of acacia and on the "kanna," which appears to be identical with the Queensland saltbush. A long list of plants which are common to South Africa and Australia adds to the force of the contention that the conditions of the island continent would suit the eland equally well with those of its African home. The hope is expressed that wealthy and enterprising people interested in the Australian meat supply may see their way to commence introducing the eland.

INDIA.—Prompted by the idea of the possibility of some addition to the duty on tea imported into the United Kingdom, a deputation representing the interests of the growers of tea in India and Ceylon waited on the Chancellor of the Exchequer on the 4th ult. in order to assure him that any such addition, if made, would have an injurious effect on that industry. The *Times* expresses no sympathy with the tea-growers in this matter. Every tax that can be proposed, it states in a leading article on the subject, is invariably met by a loud outcry from some trade which pretends that its very existence will become problematical if that particular tax is imposed. The tea deputation conformed very accurately to the common rule—their industry is of so peculiar a kind that an increase of duty is not handed on to the consumer according to the well-known economic law, but is paid by the producer, with possibly the exception of a small fraction, expressed in quality rather than in price. Yet, though the consumer does not pay the duty, he is presumed to be so sensitive to its imposition that he at once reduces his consumption of tea, so that the poor producer not only pays the duty for him, but loses his custom into the bargain. When twopence was taken off the tea duty in 1890 the consumption increased, and, though by parity of reasoning the producer and not the consumer got the benefit of the reduction, that increase of consumption is ascribed entirely to the reduction. But when in 1900 the twopence was re-imposed, the consumption does not seem to have fallen off—at least the deputation did not venture to assert so much, even when that rather serious flaw in the argument was pointed out by the Chancellor of the Exchequer. There are very good reasons for the depression in the tea industry, and these reasons must operate, no matter what the duty may be. The chief reason is over-production. More tea has been put on the market than the public want to buy, and the price has fallen as a matter of course. Not only so, but it is admitted by the deputation that the planter can at will produce, within certain limits, more tea of a poorer quality or less tea of a better quality. It seems that the growers have put quantity before quality, and have spoilt their own market. The remedy rests with themselves, says the *Times*. Let them consult at once their own interests and those of the consumer by growing less tea of a better quality.

FOREIGN COUNTRIES.—The wheat crop of ARGENTINA last season was, for the first time in fifteen years, sown on a reduced, instead of an increased, area. The official figures are 8,141,300 acres for 1901, against 8,347,980 for the crop of the previous season. The greatest expansion of the wheatfields took place between 1892 and 1898, in which period the area nearly doubled. Since the latter year there has been no considerable advance, and this year may be the first of a series of years of decline, for, with a poor yield, the financial condition of farmers will be critical, especially as the once promising maize crop has been badly injured by drought. A good deal of the land that has grown wheat continuously for several years must be partially exhausted by poor farming, and the only chance of recovery lies in the cultivation of new soil. Evidence of this is afforded by the superiority of the yield in the Province of Buenos Ayres to that of Santa Fé in the last two seasons, the latter province having by far the larger area of old-farmed land.

Emigration to CANADA.—In consequence of the large number of enquiries received from persons who contemplate settling in Canada this spring, the Canadian Government has made arrangements whereby a series of parties, accompanied by an experienced official, will be despatched from Liverpool at regular short intervals, commencing on March 13th. Full details, handbooks of Canada, and other information will be furnished on application to the Curator, the Canadian section, Imperial Institute, S.W.

The following are the dates of sailing of the different vessels leaving Liverpool and Glasgow for Canada during March, April and May. Those who decide to join any of these parties must book their passages through the usual channels.

From Liverpool:—

1. March 13th . Allan Line s.s. *Parisian*, in charge of Mr. John Webster.
2. March 25th . Elder Dempster Line s.s. *Lake Superior*, in charge of Mr. Robert Johnston.
3. April 3rd . Allan Line s.s. *Numidian*, in charge of Mr. G. H. Mitchell.
4. April 15th . Elder Dempster Line s.s. *Lake Champlain*, in charge of Mr. C. F. Just.
5. April 22nd . Elder Dempster Line s.s. *Lake Manitoba*, in charge of Mr. E. O'Kelly.
6. May 1st . Allan Line s.s. *Tunisian*, in charge of Mr. W. L. Griffith.
7. May 13th . Elder Dempster Line s.s. *Lake Megantic*, in charge of Mr. A. F. Jury.

From Glasgow:—

1. March 21st . Allan Line s.s. *Sardinian*, in charge of Mr. Thomas Duncan.

LABOUR RETROSPECT.

UNITED KINGDOM.—No little stir has been caused in labour circles by the actions at law which have arisen from the decision in the House of Lords making the funds of trade unions liable for the acts of their officers and members. Firstly, the Taff Vale Railway Company are suing the Railway Servants' Union for £24,000, as damages sustained through the strike in 1900. The Welsh coal-owners claim £70,000 from the South Wales Miners' Federation for ordering "stop-days." At Blackburn also a firm of cotton-spinners is suing the Weavers' Union for alleged damages through a strike. The proposed new agreement in the engineering trade has not come to pass, the employers' terms having been refused by the men by an apparent majority of two to one. The result of the ballot shows 9,714 votes in favour of and 16,563 against the agreement, but it is pointed out that there are 110,000 members of the three unions concerned, and only one-fourth of them have voted. Trade unionists always vote in strength when deeply concerned about any matter submitted to them; the reasonable inference seems to be, therefore, that the other three-fourths are not opposed to the measure, and probably did not take the trouble to vote because they thought their executive would receive all the support it needed. The men's objections are supposed to be due to the absence of provision for the payment of the day-work rate of wages to those asked to do piece-work. The employers, however, proposed a guarantee of "increased earnings for increased production due to additional exertion." In view of the foregoing considerations there is every possibility that further discussion of the terms may bring about an agreement. An improvement in the conditions of employment of railway servants should result ultimately from the motion passed recently in the House of Commons. It was "that the Government should exercise their power to call for returns of the hours exceeding twelve worked by railway servants, and of cases where work is resumed with intervals of less than nine hours."

COLONIES.—The commission from CANADA sent to induce emigration to the western provinces of the Dominion has been so successful that about 3,000 persons are starting this month, and others are expected to follow at the rate of 4,000 a month up to the end of the half-year. Under the arrangements now completed a would-be emigrant can join a personally-conducted party, which will be under the charge of an agent of the Dominion Government from the time of leaving Liverpool or Glasgow until Winnipeg or some still more western point is reached, the total cost of the journey being less than £8. Arrived at his destination, the emigrant could remain in one of the various "homes" set up by the Government until he had found employment, or had settled down, merely paying for his board, and if he took out wife and children the entire family would be so accommodated. No doubt is entertained that anyone wishing to obtain work on a farm would be able to get it almost at once, with the help of the local agent of the Government, which help would be freely placed at his disposal. Should he be in a position to take to farming on his own account, the Government would grant him an allotment of 160 acres, free of charge, but subject to certain conditions as to residence and cultivation. There is a great demand for farm labourers, and the wages paid in Western Canada are about the same as in the United Kingdom, but the difference is that in the former case the agricultural labourer would get his 160 acre allotment in addition, and should, in course of time, be able to set up a farm of his own. Those who are contemplating emigration, might draw a lesson from the encouraging attitude of the Finns, Germans and Scandinavians. These settlers, many of whom have chosen the district of Sudbury, are sending passage tickets for their connections and friends in their old homes in order to induce them to come out. Part of the Welsh settlement, who have endured such hardships in Patagonia, are desirous of migrating to Canada, and a deputation waited on Mr. Chamberlain, with the object of obtaining aid from the Imperial Government in reaching their new destination. The Colonial Secretary stated that he had been under the impression that the Welsh colonists wished to settle in South Africa. Had this been the case, the matter could have been dealt with by his Department, and it would have been his duty to further their wishes. It was Lord Milner's intention to prepare and submit to the Imperial Government, a scheme of colonisation and settlement under which the new colonies would undertake considerable liabilities. Colonists would, no doubt, be offered suitable land and assisted with loans. It was with an idea of this kind in view that he had consented to receive the deputation, for he should very much rejoice to have a colony of loyal Welshmen in South Africa. But the fact of these settlers wishing to emigrate from Patagonia to Canada put him in a position in which he was powerless to render assistance. For many years the Government had not assisted emigration to self-governing colonies. He had no doubt these people would find a happy and prosperous home in Canada. Possibly the Canadian Government might favourably consider an application for a loan, to be devoted to transportation purposes. Failing this, Mr. Chamberlain suggested a subscription list being opened. This was accordingly done, and a generous response was the result. With respect to the demand for skilled artisans in Natal, and the agitation regarding the immigration laws, Sir Walter Peace, the Agent-General, has made a statement. He says the system at present in force applies only to the families of men who are already settled in Natal. They nominate the women and children they wish to be introduced, adults being allowed £5 each, and children under twelve years of age £2. 10s. each. He had received a telegram from the Prime Minister, informing him of the great demand in the colony for artisans in the building

trades. A deputation of employers waited upon the Premier at Maritzburg recently, and offered a guarantee of employment to suitable men in the following branches:—Carpenters, at 14s. per day; bricklayers, at 15s. per day; stonemasons, at 17s. per day; plasterers, at 17s. per day; and painters, at from 10s. to 13s. per day. He gathered that this statement simply represented the condition of affairs in Maritzburg. There was undoubtedly a much larger demand in other parts of the colony. The Prime Minister informed him that there was a considerable and growing demand in Durban. Some of the telegrams spoke of 400 being wanted there alone. His own private advices had been, for some time, that building operations in that neighbourhood had been very much restricted for want of workmen. The cost of living had not increased in proportion to the increase in wages, and, with such wages as he had quoted, it was not a question as to whether a man could live well upon them, but merely as to how much he could save. Many a workman could live there comfortably, and save from 5s. to 10s. per day, after paying his board and lodging. Although the present demand for labour came mainly from the building trade, it applied also, in some measure, to other industries throughout the colonies, for most trades there are brisk. The building boom is partly explained by the necessity of re-building demolished buildings and railway bridges in various parts of the colony, and also by the revival of trade and the prospect of an increased population in the near future.

Mail advices make clear several points regarding the administration of the Immigration Restriction Act in AUSTRALIA. Power is given for the searching of any vessel suspected to have a prohibited immigrant on board, and where the officers administering the Act desire a medical examination, they may detain such people for 24 hours if necessary. Any person domiciled in the Commonwealth who wishes, on his return, to be exempted from the Act, may apply to the Collector of Customs at the port of departure for a certificate of domicile. It is understood that the Immigration Restriction Act is to be accepted as an addition to the Acts relating to alien immigration in force in the various States. Special care will, without doubt, be taken to exclude Chinese. A number of Italians who were debarred from landing at Perth have been allowed entry at Melbourne, the authorities being satisfied that they are eligible colonists. They are mostly vineyard labourers. It will be remembered that the clause regarding the educational test caused much discussion. It was worded as follows:—Any person who failed to write out and sign in the presence of the officer a passage of fifty words in length in the English language dictated by the officer. . . . It was pointed out, however, that this test would prohibit a desirable class of immigrants, such as German and Danish farmers, and the words "the English" were deleted, and the words "an European" were inserted in its stead. The Pacific Island Labourers Bill, which has been finally assented to, provides for the abolition of the traffic at the end of 1906, and the agitation against it is still being carried on, chiefly by those interested in the Queensland sugar industry. Sir Horace Tozer recently remarked, regarding the Kanaka labourers, that, being accustomed to life in a tropical country, they make splendid agricultural labourers—in fact, in planting, hand-weeding, thrashing and cutting cane in North Queensland, they perform work which the white man ought never to be asked to do. It is stated as proof of the necessity of Kanaka labour, that not 100 tons of sugar are produced annually in Queensland, in the production of which a Kanaka has not taken some part. An Act has passed the Queensland Legislature enabling the State to repurchase estates suitable for dairying, with a view to cutting them up into small holdings for close settlement. An Act has also been assented to enabling the State to grant special homestead areas, adjoining each other, to groups of settlers. The primary object of the measure was to meet the supposed requirements of a number of Bessarabians, who, it was believed, would emigrate to Queensland if the facilities for settlement in the same neighbourhood offered. Queensland has now followed the example of other States in adopting a measure to provide for advances being made to farmers.

FOREIGN COUNTRIES.—Affairs in SPAIN have gone from bad to worse, and the revolutionary labour movement has spread to an alarming extent. Barcelona, as usual, has been the centre of the disturbances. A strike of metal workers, dock labourers, carters, tramway men, and printers resulted in the closure of all factories and workshops, the non-union labour at the indiarubber works being the last to quit. Food became scarce, supplies being hindered by the rioters, who became so violent that troops were called out. There were many fatalities. The FRENCH coal strike has had a fairly immediate result in the passing of a Bill through the Chamber, securing an eight hours' day for miners. The disturbances were quelled and the strikers were resuming work at the end of the month. Considerations of health were urged on behalf of the measure, and the fact that long hours underground were exhausting. The other side put forward arguments regarding foreign competition and the smallness of profits, and succeeded in obtaining the introduction of a clause granting exemptions from the Bill's rules "on technical or economic grounds." The Bill has still to go through the Senate and, if it passes, the miners' day will in six months' time be limited to nine hours, which will be reduced to eight-and-a-half in two years, and to eight in four years. Although the railway strike in ITALY was arrested, the unemployed have adopted a threatening attitude, and further disturbances in Rome appear likely. The railway men thought better of leaving work, owing to the Government placing the men under military law.

The wave of inactivity which has been influencing Germany appears to be moving eastward, and the United States Consul sees every indication that AUSTRIA-HUNGARY is on the eve of a period of industrial depression. Until recently, iron, steel, electricity, petroleum, and nearly all other great industries seemed to be in a flourishing condition, the only apparent exception being the textile branch. Here, the crisis came more than a year ago, due to over-production. From the same cause the native petroleum refiners have just suffered considerably. In many of the iron and steel works in northern Austria, work has been reduced, and some establishments have notified their men that if orders are not soon received they will shut down. The Austrian locomotive works are short of foreign orders and prospects are gloomy. Car shops, furniture and tool factories, saw mills, and similar establishments are only partially employed, and the building trades complain of general inactivity. In order to bring relief, the Governments are disposed

to enter at once upon the execution of various public works, and to let out at once the contracts for such army supplies and railway rolling stock as will be needed. Regarding the alleged inducements offered by the Hungarian Government for industrial undertakings, the United States Consul at Budapest states that the experience of most foreigners has been that Hungary is not a profitable country for industry.

In TRIESTE, a dispute between the Austrian Lloyd Company and their stokers was made the occasion of a disorderly outbreak, causing serious dislocation of business. Practically all the workers of the city left their occupations. The tramway service and the goods traffic on the two railways were suspended: the foreign mails could not leave owing to the cessation of work in the harbour, and the newspapers ceased publication. There was evidently a section of the strikers who would not listen to the warning of their leaders against disorderly conduct, and these men, accompanied by the street loafers and doubtful characters which such occasions usually rouse to unwonted and misguided activity, displayed anarchical violence towards the military authorities who opposed their rioting. The Government had decided to resort to martial law, when an announcement was made that a settlement had been arrived at between the Austrian Lloyd Company and their stokers.

In the UNITED STATES the general industrial outlook remains satisfactory, and labour controversies have been few. Steel mills have been working full time in nearly all districts, and have orders on their books sufficient to guarantee a continuance of such activity for many months. In the coal trade a deficiency of skilled labour is reported. Wages generally have an upward tendency. Puddlers and finishers in all the mills controlled by the Amalgamated Association of Iron, Steel and Tin Workers have recently come in for a rise. A voluntary advance has also just been granted to glass workers.

SCIENTIFIC AND TECHNICAL DEPARTMENT OF THE IMPERIAL INSTITUTE.

RECENT EXPERIMENTS ON THE CULTIVATION OF TOBACCO.

The tobacco industry has become so highly specialised that it is necessary for the successful planter to become thoroughly acquainted with the scientific side of the processes involved in the cultivation and fermentation of this material. The qualities of the tobacco leaf as regards the size, shape, thickness, flavour and aroma, the grain and general appearance, are so easily influenced, and so difficult to control, that its cultivation in new localities can only be attended with success after much experimental work.

At the present time experiments are being undertaken in Ireland, on the culture of tobacco, by the Department of Agriculture. Some useful information on this subject is contained in Report No. 63 of the United States Department of Agriculture, and the following summary is compiled from this source. The report is a review of the experimental work conducted for some years past at agricultural experiment stations situated in widely separated localities, and is intended to throw light upon the various problems connected with the growth and cultivation of tobacco.

Methods of growing plants in seed beds.—At the Alabama State station various methods of starting tobacco seed were compared. Seeds were started in several beds, some open and others covered with cheese cloth. During the first year of the experiments the greater number of plants in the open beds were destroyed by a spell of cold weather, and during the second season they were injured by the flea beetle. In the covered beds the plants came up well, grew rapidly and were not subject to insect attacks. From these results it is evident that under the climatic conditions of Alabama young tobacco plants are readily affected by low temperatures, and quickly killed by frosty weather. At the Colorado station, in pursuing this work it was found that it took no longer to produce plants suitable for setting out by growing seeds in cold frames than by the use of the hotbed.

The following method of germinating the seed at the Georgia station proved very successful. The seeds were placed in wine glasses and soaked in water for half-an-hour, the water was then poured off,—the glasses placed in saucers containing water, and a tumbler inverted over each glass so as to confine the moistened seed in a damp atmosphere. In about a week, when the seed had started to germinate it was sown in a cold frame, and within a month from that time plants suitable for transplanting to the fields were obtained.

In the experiments conducted at the Central Experimental Farm, Canada, the seeds were sown in hotbeds, and some of the plants thus obtained were transplanted to cold frames before being set out in the fields. A striking difference was noticed between the plants set out from the hotbeds and those transplanted to the cold frames prior to setting out. The latter were stronger and grew more rapidly than those taken direct from the hotbeds. It was also found that if the plants were transplanted to a second hotbed before setting them out in the fields, the vigour was increased and the number lost in transplanting was materially reduced.

In the districts where fungoid diseases gave any serious trouble it was found quite possible to sterilise the soil used for the plant bed. Boiling water, hot stones, or steam under high pressure may be used for this purpose.

The size, weight, and condition of ripeness of the seed, as well as the method of planting, has been shown to have an important bearing upon the crop.

Varieties of Tobacco.—At Calhoun, the North Louisiana station—ten varieties of tobacco, namely, Conqueror, Hester, Long-leaf Gooch, Ragland Improved, Sweet Oronoko, White Burley, Comstock Spanish, Persian Rose, Improved Havana, and Brazilian American, were tested. Of these Comstock Spanish, Persian Rose, Improved Havana and Brazilian American, are cigar-leaf, and the rest are described as bright-leaf varieties. The last-named, with the exception of White Burley, produced a leaf which, when cured, was of a lemon yellow colour; they were more successful than the cigar-leaf varieties which, when cured, produced leaves too bright and in but small quantity.

It was also shown that Conqueror, Long-leaf Gooch, Hester, Oronoko, and Ragland Improved, cured brighter than other bright-leaf varieties, and that Vuelta de Abajo, Havana, Seed-leaf, Imported Havana, Choice Havana, Little Dutch, and Pumpelly, produced a leaf of greater silkiness and finer texture than other cigar varieties tested.

The kind of tobacco which can be grown in any district depends partly upon the climatic conditions and also upon the character of the soil. In testing varieties, therefore, consideration should in the first place be given to the type of tobacco adapted to the locality, to the soil, and the grade which the climatic conditions and soil may reasonably be expected to produce.

Influence of distance in Planting.—A study of the relation of distance of planting to yield and thickness of leaf, was made at the Wisconsin station. Plants were set 20 inches apart in rows 31 and 36 inches apart, and at intervals of 24 inches in rows 42 inches apart; close planting was found to increase the yield, and the plants nearest together in the row produced a thinner leaf than those further apart; but lessening the distance between the rows did not have this effect. A distance of 31 inches between the rows was sufficient for the full development of the plants. The surface area of the cured leaves per pound from the closest planting was 42.01 square feet, and from the widest planting 40.86 square feet.

Other experiments made with a view to ascertain to what extent close planting may be advantageously practised, showed that planting 1 foot apart in the row was not too close for Wilson Hybrid, the variety grown in this experiment. From these and other experiments it was concluded that too close planting interferes with the development of the leaves, while too large spaces between plants tend to produce coarse leaves. The dimensions of the leaf, thickness, elasticity, and size of the veins may all be more or less modified by giving the plants space or increasing the number in a row.

Fertiliser Experiments.—The results of experiments at Kentucky indicated that potassium, chloride, and sulphate, gave equally good results as fertilisers for tobacco, and that sodium nitrate produced a better quality leaf than other forms of nitrogen.

Tests with complete and incomplete fertiliser applications were also made. A yield of 1,460 lb. of cured leaf per acre was obtained after an application of 80 lb. of sodium nitrate, 80 lb. of dried blood, 160 lb. potassium chloride, and 140 lb. of double superphosphate per acre, whereas by doubling the quantity of fertiliser the yield of leaf was increased to 1,620 lbs.

Fertilisers used on soil in a good state of fertility, were found to increase the yield of tobacco considerably, and potassium chloride proved more efficient than the carbonates of potassium and magnesium.

At Calhoun experiments were conducted on red sandy and grey sandy soils, and it was shown that potash had little or no effect on the crop, but nitrogen, either in the form of sodium nitrate, ammonium sulphate, cotton-seed meal, or dried blood, caused a marked increase in the quantity obtained. An application consisting of cotton-seed meal, acid phosphate, and sulphate of potassium produced the best quality leaf.

The effects of different fertilisers on tobacco were studied at the Virginia station. Five plots manured with complete fertilisers, all of the same cost per acre, were compared with an unmanured plot. Dried blood gave the largest yield and the best financial returns as a source of nitrogen. The tobacco grown without fertilisers ripened ten days to two weeks later than that grown with fertilisers.

Influence of Time of Harvesting.—These experiments were undertaken at the Wisconsin Station to determine whether the tobacco leaf increased in size and thickness, and whether the loss in curing diminishes, when the plants are allowed to stand a considerable time after topping.

The results showed that when the plants were permitted to stand 32 days, as against others allowed to stand only 18 days, the thickness and dry matter of the leaf tended to increase, and the yield has a like tendency, *i.e.*, after curing, a greater weight of the leaf was obtained, but the area per pound of leaf was less.

It was thus possible to vary the commercial grade, and influence the price considerably, by harvesting the crop at different stages of maturity. This was one of the methods by which the quality of tobacco might be sensibly controlled.

Effect of Priming Tobacco Plants.—Priming, which consists in removing the leaves from the stalk of the plant as they mature, has a marked effect on the growth and chemical composition of the upper leaves. The removal of the lower leaves causes an increase of growth in the upper, and also a higher percentage of nitrogenous matter and nicotine. Priming is believed by many practical growers to be the proper method of harvesting the cigar- and cigarette-types, for in this way the leaves are uniformly matured and the subsequent product is consequently of a more uniform character. The priming of tobacco is more expensive than cutting the stalk, as more labour is required, but the improvement in quality fully warrants this additional cost.

Experiments in Topping Tobacco were conducted at the Central Experimental Farm at Ottawa, Canada, in order to determine how the time of topping, and the number of leaves left on the plants, affect the yield. The plants were topped July 20th and 26th and August 2nd, and on each date one plot was cut back to nine leaves and another to eleven leaves per plant. The larger yields were obtained from the latest topping, and the greater number of leaves per plant. The time and manner of topping has a great influence upon the character of the leaf produced. As a rule the earlier a plant is topped and the lower it is cut, the heavier, richer and darker-coloured the leaves become. This is a decided advantage for some crops, but a disadvantage to others.

Diseases of Tobacco.—The diseases to which most attention has been given manifest themselves during the curing process, and are commonly known as "stem rot" and "pole burn" or "pole sweat." The latter makes its appearance as small dark spots on the surface of the leaf near the veins and midrib, where moisture is most abundant. The disease is supposed to be primarily due to a fungoid growth which attacks the leaf on the surface and gives access to a bacterial process of decay by disintegrating and partially destroying the leaf tissue. It has been ascertained that moisture and temperature have a marked effect on the activity of these organisms. Decreasing the amount of moisture lowered their vitality, and a temperature up to 70° F. or even 90° F. favoured their development, while a temperature of over 100° or 110° F. and below 35° or 40° F. temporarily or permanently checked their vitality.

From investigations it was concluded that under the atmospheric conditions most favourable to the development of "pole sweat," the temperature and moisture in the interior of a closed barn could be regulated by artificial heat so as to reduce to a minimum the liability of tobacco to damage from fungi or other like organisms.

"Stem rot" is a fungoid disease which frequently affects the stems of the plants in the last stage of curing. No special experiments were made upon this disease, but as a remedial measure it was suggested that when the crop is cured all stems and refuse attacked by stem rot be burned before the fungus has matured, and the barn fumigated with sulphur immediately after curing, and again before the harvesting of the next season's crop.

Experiments in curing Tobacco.—Tobacco goes through certain processes of fermentation from the time it is cut until it is ready for the manufacturer. During this time it is said to be curing and ageing. After the harvest the leaves are speared upon laths and hung in a barn to dry. Artificial heat is often employed for this purpose. Experiments with different methods of curing tobacco have been conducted at several experimental stations. At the North Carolina station, the ordinary method of cutting down the plant and curing it with the leaves on the stalk proved less profitable than curing by the Snow process, in which the leaves are cut from the stalk as they ripen, and cured separately. A greater yield was obtained with the tobacco cured by the leaf process and the quality was better. This effect is ascribed to harvesting the leaves as they became mature, while, by the stalk process, many of the lower leaves were over-ripe, and the upper leaves still green at the time of cutting. It was found that the time and temperature required for curing leaves from different parts of the plant varied according to their ripeness, and for this reason the leaf-curing proved the most

desirable method, as the leaves were all of the same degree of maturity. At Wisconsin it was found that the loss of water in curing was about 71 per cent. of the weight of green leaf.

It is stated that the changes in the colour of the leaf during the curing process were not directly due to the loss of moisture, but depended largely upon the degree of ripeness—the riper the leaf, the lighter in colour it would be when cured.

From data obtained in this work it was concluded that tobacco should be cured in as moist an atmosphere as possible, without incurring damage from "pole burn." A temperature within the curing house not exceeding 75° F., and a degree of humidity among the plants represented by a wet bulb depression of 2°, were regarded as suitable conditions. In order to maintain these requirements, the plants should be evenly distributed in the curing-house, in order to equalise the humidity of the building, and the ventilation should be under perfect control, with a provision to regulate the humidity of the air by the use of artificial heat.

Fermentation of Tobacco.—The fermentation or sweating of tobacco is carried out in several ways. To give a general idea of the method of procedure, that followed in Florida may be cited. After the tobacco is cured, the leaves are stripped from the stalk and made up into hands, *i.e.* bundles tied together at the base. These hands are either piled on the floor or put into bins, and the fermentation allowed to proceed gradually. The temperature of the pile gradually rises, until it reaches its maximum, which is sometimes as high as 180° F. From this point the temperature gradually subsides, and finally attains the normal temperature of the room.

In connection with the changes which take place during the process of fermentation, most attention has hitherto been given to the loss in weight of the leaves and to the chemical changes which occur. At Connecticut State station the weight and chemical composition of cured and fermented leaves was compared. The loss in the fermentation of upper leaves, short seconds, and first wrappers was 9.7, 12.3 and 9.1 per cent. respectively. About three-fourths of the loss in the short seconds consisted of water, the upper leaves lost almost the same proportion in dry matter, and in the first wrappers the loss of dry matter was a little less than that of water.

The nitric acid, ammonia, fibre and starch contents of the leaves were affected very little by the process of fermentation, and the chief loss of dry matter was found to have occurred in the nicotine, albuminoids, and amide bodies, nitrogen free extract and ether extract. At the Pennsylvania station it was found that the loss in fermentation was greater with tobacco fertilised with barnyard manure than with tobacco grown with other fertilisers.

When it is considered that, commercially, tobacco is divided into four classes, *viz.*: cigar, cigarette, snuff and export, it becomes evident that the systematic observations as briefly described are invaluable to growers, who must, of necessity, produce tobacco suitable to the requirements of the market.

THE LAC INDUSTRY OF INDIA.

The resin and dye produced by the lac insect, *Tachardia lacca*, have been employed by the natives of India from very remote times, references to these materials being known in Sanskrit literature at least 4,000 years old. Formerly the dye was the more important product, and at one time to a considerable extent supplanted cochineal, even in European dyehouses, but with the advent of the coal-tar dyes, both these natural dyestuffs have practically passed out of use, and lac dye is now merely a bye-product in the manufacture of shellac. The information available regarding the life history of the insect, the chemistry of the resin produced by it, and the statistics of commerce in this material, have recently been collected in a special number of the *Agricultural Ledger* (No. 9, 1901), from which the following *resumé* has been compiled.

The insect which produces lac belongs to the zoological order *Hemiptera* and is, therefore, a near relative of the cochineal insect. Like the latter it inhabits by preference special trees, such as *Butea frondosa* (palas), *Acacia arabica* (babul), *Pterocarpus marsupium* (kino tree), *Shorea robusta* (sal tree), *Sisyrinchium jujuba*, and various species of *Ficus*. On the young twigs of such plants the larvæ settle, and fix themselves by inserting their hollow probosces in the bark and so suck out the sap, which, in the process of digestion, undergoes considerable change, and is excreted in the form of a resin with which each larva rapidly becomes completely incrustated. Meanwhile the larvæ, which were at first apparently all of one kind, have developed into insects of two sexes, the males being winged and the females wingless. The former escape from their resinous incrustations, while the latter produce eggs and complete their life history in the position first taken up by them. Each female produces about 1,000 eggs, the formation of the latter being preceded by the appearance of a bright red colouring matter which is probably intended to serve as nutriment for the young larvæ, since these remain *in situ* until mature and able to creep to a new portion of the twig, where they repeat the life cycle outlined in the foregoing paragraph. Where the lac insect is propagated for the sake of its resin, the twigs are cut just before the larvæ are mature, and these cuttings are placed on fresh twigs which then rapidly become infested by the escaping swarms. Two broods of larvæ are produced each year, the first early in July and the second early in December. The most serious enemies of the lac insect are ants and moths, since the former attack the females in order to obtain the sweet juice upon which the larvæ are fed, while certain species of moth eat both the females and the young larvæ. These pests are difficult to exterminate, since the application of any of the usual insecticides would destroy both victim and aggressor.

It is uncertain whether or not the continued propagation of the lac insect upon trees seriously injures the latter; according to Sir William Jones (*Asiatic Researches*, II. 1789, 361), trees are frequently destroyed in this way, but McKee (*Indian Forester*, Vol. I. page 269), is of opinion that no great harm is done, although, probably, both the host and the insect benefit when the tree is regularly pruned in order to encourage the formation of new branches, and Ridley (*Indian Forester*, XXII., 440), has shown that in many cases the damage to the tree is done not by the insect but by the carelessness of the native lac collectors.

In the original article, which extends to 350 pages, a considerable amount of space is devoted to descriptions of the methods of propagation and collection in vogue in the different provinces of India and to the extent of the local trade, but as this portion contains no information of general interest it may be omitted from the present summary.

The lac is collected just after the swarming seasons by cutting off the twigs bearing the resinous incrustations, which are often sold in the bazaars without further preparation under the name "stick lac." In the native factories this material is crushed in grain mills, whereby the resin is ground into a rough powder, which is freed from wood and refuse by sifting, so forming seed-lac; the latter is then macerated for a day in water and finally ground under water in an exceedingly primitive manner. The liquor so produced is of a bright purple colour, and is the source of the lac dye which was formerly an article of commerce. The washed seed-lac is next mixed with a certain small quantity of orpiment, in order to give the finished shellac a pale straw colour, and about three per cent. of common resin is added in order to lower the melting point and make the material workable in the processes through which it subsequently passes. The mixture is then packed into a narrow cloth bag from ten to twenty feet in length, which is held in front of a long shallow coke fire whereby the resin is melted. The bag of resin is manipulated by two men who twist it in opposite directions,

causing the material to ooze out, and as it drops it is collected on the plantain leaves with which the floor of the room is covered.

The masses of soft resin adhering to the plantain leaves are once more heated, and a piece of aloe leaf attached to one end, whereby the operator can stretch the soft resin in all directions, forming ultimately a large sheet of uniform thickness.

In the better class of factories the plantain leaf has been abandoned in favour of polished tiles, and the stretching is done by attaching the warm masses of lac to hot zinc rollers, but the final stretching is still accomplished in the old-fashioned way. Finally the sheets are carefully inspected, and all dark coloured or dirt-impregnated pieces broken out.

As regards the chemistry of shellac, practically nothing is at present known, and the *Agricultural Ledger* article merely gives a summary of the results obtained by John, Unverdorben, and Tschirch and Farner. Of these, the work of the two first-mentioned chemists was accomplished many years ago, before methods of attacking such difficult problems as the constitution of resins had been evolved, whilst the investigation conducted by Tschirch and Farner was of a very superficial character, as the following summary shows. These authors found that the specimen of shellac with which they worked contained 74 per cent. of true resinous matter and small quantities of lac dye, moisture, and inorganic impurities. The resin consisted of two distinct substances, one soluble in ether and the other insoluble. To the former they assigned the constitution of an ester of a resino-tannol and aleuritic acid, whilst they regarded the second as an indifferent substance, and named it crythrolaccin, since it formed yellow spangles which, on heating, sublimed and condensed to red needles. Aleuritic acid was regarded as a paraffinoid acid, and therefore the authors assumed that shellac and amber differed from all other resins in this respect, an assumption scarcely warranted by our meagre knowledge of the constitutions of the resin acids.

A series of analyses of seed-lac from Assam is published by Mr. Hooper, showing that the amount of resin contained in this material varies according to the care which has been exercised in grinding and sifting it, the finest powder containing the highest percentage of resin. The bleaching of shellac by chlorine, sulphur dioxide, carbon, and other agents is also described, and outlines of the processes suggested by various manufacturers are given; but no explanation is offered of the fact that much of the bleached shellac of commerce is usually insoluble in alcohol, and therefore useless for varnish making.

The shellac of commerce usually contains a small amount of the wax, simultaneously produced by the insect. This substance was investigated by Benedikt and Ulzer in 1888, and shown to consist essentially of the palmitic and stearic esters of myricyl and ceryl alcohols, and is therefore somewhat like beeswax in composition, but so far it has not been used for similar purposes; Hooper suggests that its hardness and stability render it an excellent material for seals to be attached to documents.

THE INDUSTRIAL AND ART USES OF LAC.

The native artisan employs this resin for a bewildering variety of purposes, but especially for the ornamentation of wood and metal work, to which it is applied either in the form of a varnish or melted. In the latter case the skilled worker, by employing lac coloured by aniline dyes or inorganic pigments, is able to produce complicated and artistic designs with very primitive apparatus. The original article gives an interesting account of the various ways in which this lac decoration is accomplished, but an adequate summary would occupy much space, and, moreover, would only interest specialists in wood work, so that it may for the present purpose be omitted. In addition to this, the most general outlet for the resin in India, it is used as a bed for hammering out gold and silver by native smiths, while lapidaries employ it for the embedding material of their grindstones. Cheap ornaments and toys are made from it, either entirely or with a thin external coating of more valuable material. Lac dye is still employed to a small extent by native tanners and wood-stainers, whilst Hindoo ladies often use it to stain the soles of the feet and palms of the hand. In Europe and America the resin, in the form of shellac, is one of the most common ingredients of the spirit varnishes and polishes used in cabinet-making and the manufacture of hats, whilst concentrated solutions in methylated spirit are often employed as cements. The following statistics compiled from the official returns show the extent of India's export trade in this material:—

SHELLAC.						LAC-DYE.
Year.	Total Export.	Value.	To United Kingdom.	To United States.	To Continental Ports.	Total Export.
	Cwt.	Rupees.	Cwt.	Cwt.	Cwt.	Cwt.
1876-1877	89,880	42,20,497	—	—	—	19,051
1884-1885	106,747	45,36,326	68,654	21,152	15,413	106
1897-1898	189,329	92,86,795	82,291	53,698	51,069	Nil.
1899-1900	195,239	92,65,600	60,257	79,615	52,102	1

These figures are of particular interest, as showing the remarkable decline in the export of lac dye which followed the introduction of synthetic dyes, and as illustrating the fluctuations in the price of shellac. A third curious feature is the falling off in the export to the United Kingdom, which is explained by the corresponding increase in the shipments to continental ports, since continental importers now generally buy direct from Calcutta instead of via London, as was formerly their custom.

SOFT PORK.

Canada, during the year 1900, exported bacon to England of the value of \$12,000,000. Among the qualities necessary for first-class bacon in England none is of greater importance than firmness, any tendency to softness or tenderness being quite sufficient to rate it at second-class prices, and, if this softness is at all pronounced, to make it unsaleable at a profit. These facts have led the Canadian agricultural authorities to make an investigation into the character and causes of soft pork, this detrimental character having been especially developed in the produce of certain districts. Five series of experiments were made, during 1899 and 1900 respectively, at the central experimental farm, Ottawa, consisting of feeding trials, followed by a chemical examination of the pork produced.

The first step was to ascertain the difference in composition of firm and soft pork, so that chemical analysis might be employed as discriminating agent of the quality. Samples of the two qualities were taken, and the olein determined in the dry filtered fat, when the following results were obtained:—

	Firm.		Soft.	
	Loin.	Shoulder.	Loin.	Shoulder.
	%	%	%	%
Olein (calculated)	63.71	64.40	79.95	80.18
Palmitin and Stearin	36.29	35.60	20.05	19.82
Ratio of Palmitin and Stearin to Olein	1:1.76	1:1.80	1:3.99	1:4.02

These figures show very clearly that the fat of soft-bacon contains a much smaller proportion of solid fats, palmitin and stearin, which explains its characteristic flabbiness. The fat of immature pork was found to contain more than the average amount of olein, and was consequently more or less soft. The fat of bacon classed by porkers as very firm contains 68 per cent. of olein or less, while very soft contained 75 per cent. or more.

In the first series of experiments the influence of the character and quantity of food given to the animal, its age when slaughtered, of exercise and locality, upon the development of fat were determined. In the second series it was considered unnecessary to repeat the details as regard eastern and western origin, limited and unlimited ration, and exercise, as these factors exerted very little influence on the firmness of the resulting pork, and only the effect of varying ration was determined. A summary of the results is given in the following table, beginning with the firmest pork. The figures relate to the fat derived from pigs fed on the given rations:—

Composition of Ration.	Olein.	Melting Point.
$\frac{1}{2}$ corn meal; $\frac{1}{2}$ oats, pease, barley ($\frac{1}{3}$ each), and skim milk; sugar beets	66.9	32.3 C.
Pease	67.2	32.5
$\frac{1}{2}$ corn meal; $\frac{1}{2}$ oats, pease, barley ($\frac{1}{3}$ each); skim milk and mangels	68.2	32.7
Oats, pease, and barley ($\frac{1}{3}$ each)	68.7	32.4
$\frac{1}{2}$ corn meal; $\frac{1}{2}$ oats, pease, barley ($\frac{1}{3}$ each) and skim milk; turnips	70.4	32.3
Corn meal and skim milk	70.9	33.3
$\frac{1}{2}$ corn meal; $\frac{1}{2}$ oats, pease, barley ($\frac{1}{3}$ each), and skim milk	72.3	31.1
$\frac{1}{2}$ corn meal; $\frac{1}{2}$ oats, pease, barley ($\frac{1}{3}$ each), and cooked pumpkins	73.3	31.4
$\frac{1}{2}$ corn meal; $\frac{1}{2}$ oats, pease, barley and artichokes	73.4	31.5
1st period, oats, pease, barley ($\frac{1}{3}$ each); 2nd, period corn meal	73.9	31.1
$\frac{1}{2}$ corn meal; $\frac{1}{2}$ oats, pease, barley ($\frac{1}{3}$ each)	74.6	30.3
1st period, corn meal; 2nd period, oats, pease, barley ($\frac{1}{3}$ each)	76.1	30.9
Corn meal only	83.6	28.6
Beans	84.9	29.5

The data obtained in the course of these experiments show clearly the kind of fodder supplied to the animal exercises profound influence on the composition of the fat produced, and it is remarkable that the food-material of such similar compositions as pease and beans should, in animal metabolism, give rise to such differences as are shown in the foregoing table. The practical investigation of the matter has, however, been carried on on a sufficiently large scale to afford conclusive and reliable results, and the production of bacon of the required quality would appear in the future to depend on the farmers adopting the fodders which produce least olein.

THE USE OF OZONE FOR STERILISING WATER.

Ozonised air has long been known to be a very efficient steriliser for water, although the dry gas has been found to possess little bactericidal power. Its use has, therefore, been suggested for the purification of potable waters, but the early experimental installations, which were erected at Blankenburg, Oudshorn and Paris, are reported to have been abandoned, and at present the process is only known to be in operation at Lille in France, at Bole in Mexico, and at Moscow in Russia. The method is a simple one, but hitherto the cost has been a considerable factor against it, though upon this point it has been difficult to get trustworthy figures. Recently, however, the process has attracted renewed interest, and one of the London water companies is at present conducting experiments with a view to introducing it here. Considerable interest, therefore, attaches to the publication of details regarding the working of the small experimental installation which was erected by Siemens and Halske, at Martinikenfelde, near Berlin, in 1898.

The ozonisers employed here are of the Siemens and Halske plate and tube type, and yield from 20 to 25 grams of ozone per E.H.P. hour, with an E.M.F. of 12,000 volts. Air is first forced through a drying chamber and then passes into the ozonisers, on leaving which it contains from 2.5 to 3 grams of ozone per cubic metre. It is then led to the base of the sterilising tower, a square structure packed with flints, and as it rises through these it meets a descending stream of the water to be sterilised, which has undergone preliminary filtration through sand. The plant in question is capable of treating 240 cubic metres of water in 24 hours (1 cubic metre is equal to about 220 gallons), and the results of the exposure to ozonised air will be seen from the following tests made with water from the River Spree. With a consumption of two grams of ozone per cubic metre of water, the number of bacteria per cubic centimetre was reduced from 600,000 to 10; the permanganate absorption figure was diminished by 18 per cent., and the aeration of the water was increased from 10 to 12 per cent.

The capital outlay for an installation capable of treating 150 cubic metres of water per hour is estimated to be £6,750, of which total the ozonisers and sterilising tower absorb £3,750. The actual cost of treatment for a plant of this size is given as 1.726 pfg. per cubic metre, and the total cost, including interest and depreciation, amounts to 5.031 pfg. per cubic metre, the latter figure being equivalent to about £11 per million gallons.

In addition it may be noted that Siemens and Halske have recently patented a method of clearing turbid water by the combined action of ozone and iron.

THE TREATMENT OF AURIFEROUS MISPICKEL ORES.

The ores worked at the Deloro Mine, in Ontario, are derived from several veins, the two principal being the Gatling and the Tuttle lodes, where the ore consists of quartz heavily impregnated with mispickel, and occasionally chalcopyrite and iron pyrites. It is treated both for its gold and arsenic contents. Other veins in which the ore is oxidized are being worked, and it is necessary to treat them in a different manner. The strike of the veins is nearly north and south, whilst the dip varies from 45° to 63° to the horizon. The average width of the Gatling lode is 4 to 5 feet, and the wall rock is talcose schist or diorite, the latter being the country rock. The fine crushing is performed by means of a series of stamps, with a capacity of 4 tons per day. As much of the free gold as possible is caught by amalgamation, the amount so obtained being generally 57 per cent. of the assay value. The pulp, after leaving the plates, is passed over 6 feet corrugated belt Frue Vanners, by means of which the sulphides and coarser particles are separated. These concentrates consist chiefly of mispickel with some iron pyrites, small amounts of copper, and 15 to 20 per cent. of quartz sand. The latter renders the dense concentrates more readily leachable. For leaching 2 lb. of potassium cyanide and $\frac{1}{2}$ lb. of cyanogen bromide are used per ton of concentrates, and the gold is precipitated from solution by means of zinc dust, of which 19 lb. is consumed per ton of concentrates. By these solutions an average of 90.5 per cent. of the gold content is extracted. After separation of the gold the concentrates are calcined for arsenic, and the arsenious oxide obtained after resublimation is quite white and practically pure. The production of the latter is 40 to 50 tons a month, which is the total American output of this material.

LECTURES AND PAPERS.

"THE ECONOMIC RESOURCES OF THE STRAITS SETTLEMENTS AND THE MALAY PENINSULA."

(By H. N. RIDLEY, Esq.)

SIR CECIL CLEMENTI SMITH presided, on the 16th December, at an illustrated lecture given at the Imperial Institute by Mr. H. N. RIDLEY, Director of the Botanic Gardens, Singapore, entitled "The Economic Resources of the Straits Settlements and the Malay Peninsula."

Probably, said Mr. Ridley, no portion of the Empire was so little known to the English public as the Straits Settlements and the attached Federated States. It was, however, one of the most thriving of the smaller colonies, and possessed, in Singapore, the most important port in Eastern Asia.

Its heavy rainfall, of over 100 inches annually, was evenly distributed throughout the year; so, unlike other tropical regions, there were no seasons. The trees, which were evergreen and for the most part bore flowers and fruits irregularly all the year round, grew with great rapidity; consequently it had been found more suitable to cultivate plants whose produce was derived from the vegetative portion rather than from the fructificative. The climate, though hot, was neither unpleasant nor unhealthy, and cases of sun-stroke were almost unknown. Coolie labour on the estates was supplied by Javanese and Tamils; the Chinese, though very industrious and invaluable when working for themselves in agriculture, commerce, or mining, had not been found amenable to European methods of discipline.

The greater part of the Malay Peninsula, which consisted of hills rising to about 7,000 feet altitude with more or less flat country running along the coast-line, was, or until recently had been, covered with dense forests; and the characteristic view from almost any of the hill-tops at the present day was one of endless trees, of which there were several thousand kinds, although to the casual observer they seemed very similar. These produced excellent timber, both hard and soft woods suitable for all kinds of purposes, while some of them, ebony and other ornamental woods, were suitable for cabinet work.

Among the trees of special interest Mr. Ridley mentioned the camphor, not the Japanese camphor tree from which the camphor of commerce was now obtained, but a much larger one, belonging to a different natural order, and from which camphor had originally been obtained some hundred of years before the discovery of the Japanese tree. This Malay camphor was obtained from the hollows of the trees, but it was very scarce and far too expensive to come into the London market. It was sought by the Malays with quaint ceremonies, and generally used in magic and religious ceremonials by both the Malays and the Chinese.

Wood-oil was obtained from certain of the large trees by cutting a hole in the trunk about a foot across and six inches deep and lighting a fire therein. This caused the oil to flow out, which was caught in tins and used as varnish. Owing, however, to the death of the trees the supply of the oil had become so scanty that it seemed nearly to have disappeared from commerce. The sweet-scented incense gum, benzoin, was also obtained from one of the Malay forest trees, and formed the chief element in the incense used in churches.

The most important of the Malay jungle products, however, was gutta percha, without which the submarine telegraph cables could never have developed to their present importance. This tree, the *Isonandra gutta*, was confined to the Malay Peninsula, Sumatra, Borneo, and the islands of the immediate neighbourhood. It was discovered in 1843, first being noticed on account of its property of becoming soft and easily moulded in hot water. Its high insulating powers, and resistance to sea-water, were soon noticed, and it very shortly was in great demand for electrical work, surgical instruments, and many other purposes. The tree was of very slow growth, but eventually attained great size. The gutta percha was obtained by felling the trees and cutting rings through the bark all up the trunks, when it exuded in the form of white milk, which was collected in leaves and set into blocks of different forms.

So great indeed had been the demand that every accessible tree of any size had been felled, not only by the Malays, but by the wild tribes who rambled all over the forests, and consequently in large areas no tree large enough to produce seed remained, and the plant was on the verge of extinction. The trees produced seed very seldom, and although Mr. Ridley had offered large prices for some none had been forthcoming. The Government of the Straits Settlements had consequently stepped in and taken measures for the protection of the remaining trees. The amount of gutta percha produced by felling and cutting was very small in proportion to the age and size of the trees; one upwards of a hundred years old would produce but 2 or 3 lb.

However, a Frenchman in Singapore had, about eight or nine years ago, discovered that, by drying the leaves and twigs of the tree, and grinding them to powder and then mixing the powder with water, the gutta percha floated to the top so that it could be skimmed off and pressed into blocks. He had started a factory in Singapore, which had, at his death, passed into other hands and had been eventually transferred to France, whither the leaves and twigs were now sent to be worked. By this simple method, and by growing the plant in the form of bushes rather than trees, it was hoped that in time the Malay Peninsula would be able to furnish the world with a good and regular supply of this valuable product.

The rattan was another important jungle product. It was the stem of a thorny, climbing palm which scrambled about and over trees by the aid of sharp hooks with which the leaves and flower-stems were provided. There were a great many different kinds of rattans, and Mr. Ridley gave an interesting account of the method of cutting them down and preparing them for shipment to Europe and the United States, for manufacture into chairs, baskets, etc. As the supply was hardly equal to the demand, the plant was now beginning to be cultivated, and a reasonable return might be expected with but very little expense.

Coffee was cultivated over a large area of the Peninsula, and the large seeded Liberian had been found to grow there very well indeed, and better than the more valuable Arabian variety; but, unfortunately of late, the price of Coffee had been so low that most of the planters were adding the valuable Para rubber tree to their estates. This tree, a native of the Amazon district in Brazil, had been introduced from Ceylon in 1884 to the Botanic Gardens in Singapore, where it has been found to grow with remarkable ease and rapidity, and to produce a very good yield of first-class rubber.

While coffee had been in the ascendant, however, the planters had not troubled themselves about rubber, but now, owing to the increased demand for the latter commodity, due in great measure to the rapid evolution of the bicycle and the motor-car, the attention of planters all over the world had been directed to this product. A large number of plants produced rubber, of one kind or another, but that from the Para tree was by far the best. Attempts had been made to cultivate this tree in many parts of the world, but with only partial success. In the constantly damp and warm climate of the Straits Settlements, however, it has grown with astonishing rapidity. A tree raised from seed attained its full height of 50 feet in five or six years, after which it continued to increase in girth to about 4 feet, in twelve years. The expense of cultivation was very small, no manure being required, and the tree could be tapped when six years old, when it would produce about 2 lb. of rubber a year. Older trees produce more. The rubber was obtained by cutting first a narrow channel through the bark vertically, with slanting ones leading into it all the way down the trunk of the tree, at the foot of which a little box was placed with the lid so arranged that, although the rubber-milk could get in, dirt and rain-water could not. The trees were tapped in the afternoon and the rubber collected from the boxes on the following morning. Every

day for a week, at 4 o'clock, a thin slice was cut off the edges of each slit, and more milk ran out until the tree was finally exhausted. The wounds were then left to heal, which usually took about one or two months. The trees could be tapped once or twice a year according to size, and the rubber thus obtained was worth from 4s. to 4s. 6d. a pound. Even at half that price the cultivation would be the most remunerative of any in the East, and thousands of trees were being planted all over the Peninsula as fast as the seeds could be procured.

The india rubber, *ficus elastica*, so common in pots in English houses, was being cultivated by many planters. Its appearance, however, was very different when grown into a large tree with great roots. It was a native of the Peninsula, and thrived well there, but its rubber was of less value than that of the Para.

Another paying crop, which was cultivated wherever the soil was sufficiently sandy for its growth—generally along the sea-coast, was the cocoanut; and large areas were devoted to its cultivation in Singapore, Penang, Province Wellesley, and elsewhere. In some places the trees were severely attacked by two kinds of large beetles, which burrowed through the shoots and soon caused the death of the tree. The destruction of trees, at one time, had been enormous, until a law had been passed compelling owners to destroy badly affected trees, and also the rubbish heaps in which one of the beetles bred. This law had had very beneficial results. The nuts were sold either for food, for which there was always a large demand, or as copra—made by splitting the nuts in two and drying the halves, which were used for the manufacture of oil and stearine.

The betelnut palm was also cultivated to a considerable extent, and although betel chewing had largely gone out of fashion in the Peninsula, there was still a considerable demand for the nut in India. It was also used to a small extent in European medicine.

The most useful of the palms, however, was the sago, which was planted in a good many places in the Peninsula. Three sago plants would give more nourishment than one acre of wheat, and one acre of sago as much as 163 acres of wheat; in fact sago gave a larger amount of food per acre than any plant in the world. The plant was grown from cuttings, or seeds, in wet swampy places, forming dense thickets, with its huge leaves 20 feet in length. The main stem crept along the ground and threw up great branch stems, about 40 feet high and 1½ feet through, which eventually produced at the top great panicles of flowers and fruits. The plant took twelve years to produce its first stem, after which its growth was more rapid, and fresh stems appeared regularly, so that at most times of the year, in a big plantation, there were generally stems ready to cut. These were felled when full size, but before the appearance of the flowers, and cut into pieces about two feet long. They were then split in half, the bark and woody exterior removed, and the sago manufactured from the inside white pith, first into sago flour and then into granulated or pearl sago. A full size stem would produce as much as 600 or 700 lb. of flour, and about 30,000 tons were exported annually from Singapore.

The tapioca plant was a tall, half-shrubby plant, resembling somewhat the castor oil. It was a native of South America, but had long been cultivated all over the East, and was very largely propagated from cuttings of the stem, which were just stuck into the ground, and, in a year or eighteen months, attained a height of about six feet, forming huge thick roots under ground. When these roots were of full size, the plant was cut down and the roots dug up and taken to the factory to be manufactured into flake or pearl tapioca. This plant was always cultivated by the Chinese. Only three crops were taken off the land. Its cultivation, often a very paying one, was said to injure the soil, and so was not one upon which the Government looked with much favour. Tapioca and sago were, of course, used for many other purposes than as food.

Gambier, cultivated entirely by the Chinese, was a climbing shrub. It was always grown in the open field in the form of bushes, which were severely cut every year. The branches and leaves were then taken to the boiling sheds, and, after going through various processes, the gambier was shipped to Europe for the use of tanners. Another, a totally different plant, the mangrove, produced a tan-stuff which was now finding its way into our markets. The mangrove was a tree growing on the edges of tidal rivers and sea-shores, wherever they were muddy. This particular tan-stuff was also used in combination with indigo as a dye-stuff by the Chinese. Indigo, however, was not a large or important cultivation in the Peninsula. It was only grown to meet a small local demand.

Pepper was another plant generally cultivated by the Chinese, usually by gambier planters. It was raised from cuttings and climbed up large stems or posts. Formerly it had been a highly priced article, but of late years had fallen off very much and its cultivation in the Straits had diminished. Now, however, the price had risen and the Chinese and Malays had recommenced planting.

The Straits Settlements were famous both for nutmegs and cloves, which were also chiefly cultivated by the Chinese. The nutmeg, as grown in the Straits, was quite a small bushy tree with deep green leaves and fruit resembling a small peach. When ripe the husk split partly open, exposing a black seed, covered with a beautiful scarlet net-work. This net-work, the mace, was taken off when the fruit was ripe and dried in the sun. It was often more valuable than the nutmeg itself.

This cultivation was an old established one. In 1848 Singapore alone supplied over four million nutmegs, but in 1860 a disease was developed which entirely destroyed the cultivation in that place, and nearly did so in Penang. European planters had been ruined, and their estates and houses sold for very small sums. The Chinese then started the cultivation in Penang, and had kept it up to the present time.

Mr. Ridley, not long ago, had his attention called to what he considered the same disease, and on investigation he found it due to a minute beetle which burrowed into the bark of the tree, beneath the ground, so that its presence was not noticed until, by its burrows, the cambium, or living layer of the bark of the tree, was destroyed and the tree appeared to die suddenly. Had this discovery been made in 1860 the cultivation could easily have been saved. This was, he said, an excellent example of the importance of the entomologist to the planter.

The most important native cultivation in Singapore was the pineapple. The plants grew from cuttings, placed close together, and completely covered the ground. The fruit, when ripe, was cut and brought into the town in cartloads to the preserving factories. The industry of tinning pines was a large and very remunerative one. By far the largest number of the best preserved pines in the markets of the world came from Singapore, where the price of a pine varied from ½d. to a penny a piece. The plants produced fruit nearly all the year round, were very easy to cultivate, grew in the worst of soils, and its only enemies were porcupines and wild pigs.

From the leaves of the pine a very beautiful fibre was extracted. The leaves of the ordinary varieties, however, were too short to be used successfully for this purpose, the most suitable leaves being from plants in waste ground that had grown up with grass and scrub among them.

The Malay Peninsula was remarkable, according to the mineralogist, for having given samples of almost all the known elements, but these were so sparsely and generally scattered over the whole region that the expense of collecting most of them would hardly repay the cost. Tellurium, wolfram, and titanium were comparatively common. Gold, silver, lead, zinc, copper, antimony, and other metals all occurred in small quantities widely scattered over the country; but little mining had been done except for gold and tin. In former years the Peninsula produced a good quantity of gold; the yield, however, at the present time was but small.

Tin was the mineral of the country, being found there in great abundance; in fact, more than one-half the world's supply was derived from the Peninsula. The greater part of the

mines were alluvial, though lodes had been found and worked. Rich beds occurred in the stream valleys at the bases of the hills in Selangor and Perak, and were worked by the Chinese, who dug to no great depth, and washed the alluvium with very primitive sluices. The tin was sold to European firms, melted into ingots at Singapore, and then exported.

In conclusion, Mr. Ridley said that in the course of a single lecture it would be impossible to give more than an idea of the great wealth of resource of the colony. He had attempted to describe rather the peculiar vegetable products of the country, so as to show what had been done in the introduction and cultivation of new and exotic plants during the last half-century. When Sir Stamford Raffles planted the English flag on Singapore Island in 1819, it had been inhabited only by about 200 fishermen and pirates; now it was the most important port in Eastern Asia, with a population a thousand times as large. Then the Native States had been in a constant state of war and anarchy, and the natural wealth of the country was neglected; now, owing to the energy of the white man, aided by the patient hard work of the Chinaman, the forests had been felled, mines opened up, cultivation introduced, and commerce developed. An era of justice, freedom, and peace to all had been inaugurated, and the country had become one of the most thriving of our tropical colonies.

There were still, however, large areas of country practically unexplored, and doubtless much mineral wealth untouched; and Mr. Ridley was of opinion that the colony was only really in its infancy, and that gradually and steadily the work of progress would continue year by year, and he was confident that the future of the Malay Peninsula would be one of great and increasing prosperity.

The lecture throughout was illustrated by a well-selected series of slides, many of which had been specially prepared.

The chairman, in proposing a vote of thanks "for a very attractive lecture," referred to Mr. Ridley's commendable simplicity of language, and to his avoidance of technical expressions, which had enabled all those present to carry away every single piece of information which he had been good enough to impart to them.

Sir Cecil Clementi Smith said he should like to take this opportunity of drawing attention to the work that Mr. Ridley, and the Directors of other Botanical Gardens, were doing in going out to the Colonies and devoting themselves with ardour and zeal to economic botany. They, in a quiet and unobtrusive way, were winning victories over nature of which the ordinary man in the street knew absolutely nothing. They did not get honours thrust upon them or mentioned in the newspapers, but their work was nevertheless of extreme value in forwarding our efforts of making human life more endurable and more delightful. Mr. Ridley's labours—only a small portion of which he could have referred to that evening—in experimenting on the cultivation of plants, and the similar work of the Directors of other Botanical Gardens, were of immense benefit to the Empire. Most people in this country knew Kew as a place where they could see beautiful and attractive things grow. It was, however, much more than that. The making the gardens attractive formed but a small part of the duty of Kew. It was a mighty organisation and the centre of the botanic activity of the Empire; and Mr. Ridley would probably be the first to acknowledge the great assistance he had received in his botanical efforts from the Authorities of the Royal Botanic Gardens, Kew.

"FEDERAL FULFILMENT."

(By The Hon. SIR JOHN A. COCKBURN, K.C.M.G.)

Admiral Sir EDMUND FREMANTLE presided, on the 27th January, at a lecture given at the Imperial Institute by Sir JOHN COCKBURN on "Federal Fulfilment."

To twine together into an efficient federal fabric the strands of six independent communities was, said Sir John, an intricate task, and patience, courage, and talent were necessary to the process. Abundant proof, however, of the possession of these qualities had been given by the Federal Government during the course of a year which had been brimful of events of paramount importance to Australia, and portentous to the Empire.

After making fitting allusions to the late Queen, one of whose last public acts had been to send a message of greeting and goodwill to the new-born nation; to the voyage of the Prince of Wales to open the Federal Parliament; and to the recent resolution of the Commonwealth Parliament making common cause against the slanderers of our soldiers—Sir John reviewed some of the more important events of the year.

The long desired consummation of Australian free trade had been achieved last October. As had been anticipated, the tariff combined provisions for producing revenue with moderate protection, a necessary resultant of the policy and requirements of the individual States. He had no doubt but that the tariff would pass the Commonwealth Parliament without any serious alterations. To some minds the proposals put forward might appear novel and even heterodox; the growth of necessary manufactures was to be encouraged by bonuses, and a rebate of excise was to be allowed on white-grown sugar.

Sir John was very enthusiastic with regard to this Federal Tariff, and contended that a middle course had been taken which was not only to be commended, but was, in fact, the only satisfactory one that could have been adopted.

Australia had a habit of knowing what it wanted, and generally took a pretty straight cut to the point to be reached. One thing with regard to the parliamentary representatives of the Commonwealth was worthy of comment, viz.; that they were drawn from every class of the community—certainly a most excellent sign for a new nation.

A good deal was said in the lecture about the labour problem, and of the action of the Federal Parliament in setting a term to the Kanaka traffic. This question of a White Australia was not confined to any class, but was a serious national matter. It was easy for those at a distance to lightly regard the prospect of racial admixture, but the Australians, having before their eyes the difficulty of the coloured problem in America and South Africa, did wisely to determine to profit by the experience of others in the direction of prevention being better than problematical cure.

Australia was only a few days' steam from the vast coloured populations of the Pacific, and the country was naturally apprehensive of a condition of things which might at any time result in the loss of the very object of Australia's existence—the upholding of the interests and traditions of the British in the Pacific, for the Pacific was going to be the great international arena of the future; and the loss to the Empire, if Australia were to become denationalised, could not be measured. No Government could have dared to have trifled with the question. In fact both the political parties in the Commonwealth Parliament claimed the copyright of the phrase "White Australia," and there was no class in the country that did not dread the possibilities of a large coloured invasion.

Although this action with regard to the Kanakas had been denounced by an influential class in Queensland, the decision had been inevitable; in fact the proposals of the Opposition party with regard to the recent coloured legislation had been, Sir John maintained, more stringent than those of the Government.

The decision not to subsidise steamers employing coloured crews had been regarded by some as a new development, but it was in reality the outcome of unanimous resolutions arrived at by the Australasian colonies at the Postal Conference in New Zealand in 1894, and Tasmania in 1895. It had been stated in the debates in the Senate that 25 years ago we had 200,000 white men in our vessels and to-day but 100,000. It was impossible to contemplate with equanimity the weakening of our mercantile marine as a potential naval reserve, and, in its patriotic stand against further depletion, Australia deserved well of the Empire.

The question of broken seals on ocean steamers' stores was a corollary of Australian Free Trade. Previously, vessels trading from one port to another port in the same colony had to carry duty-paid stores. Now, all the ports in Australia were on the same footing, being all within the Commonwealth, and, therefore, all inter-State steamers had now to carry duty-paid stores. As ocean steamers competed with these for the local traffic, it would seem to be unfair to allow a privilege to one competitor which was denied to another.

The Federal authority had studiously refrained from attempting to overshadow the States. At the Convention it had been decided, without a division, that the State Governors should continue to be the channels of communication between the States and the Imperial Parliament, and Mr. Chamberlain was too wise and too sympathetic an interpreter of the Constitution to ignore, for the sake of official convenience, so definite a landmark of autonomy.

The retention of the direct appointment of the State Governors by the Crown had secured the services of men so well able to maintain the dignity of the office as Sir George Clarke and Sir Herbert Chermiside; and Lord Hopetoun, by his perfect sincerity and earnest devotion to duty, had surpassed even the high expectations based on his previous record.

The tone of Sir John's lecture throughout was most optimistic, and he expressed himself thoroughly satisfied with the first year's achievements of the Commonwealth, which augured well for its future. At the conclusion of the lecture a number of slides were shown of the various statesmen who had been connected with the federal movement, of the Commonwealth fêtes, and of several of the industries of Australia.

Sir Edward Fremantle, in proposing a vote of thanks "for a most interesting, eloquent and attractive lecture," said that he entirely agreed with Sir John Cockburn as to the importance of maintaining the efficiency of the mercantile marine, and considered that it must on no account be allowed to decay. He had listened with great interest to the references made to Sir George Grey, whom he had known personally, and who had frequently been on board his ship when he had been in Australian waters.

"THE NATIVE RACES OF NIGERIA."

(By C. F. HARFORD-BATTERSBY, Esq., M.D.)

Mr. T. F. V. BUXTON presided on the 3rd ult. at a lecture given at the Institute by Dr. C. F. HARFORD-BATTERSBY, Principal of Livingstone College, on the "Native Races of Nigeria."

In his introductory remarks the chairman referred to the great interest that was now being taken in the expansion and consolidation of the British Empire, and also to the consequent responsibilities such dominion imposed upon us towards the millions of people, belonging to innumerable races and tribes, who were now our fellow-subjects. An added interest, however, attached to Nigeria, as it had only as recently as last year been taken over from the Royal Niger Company, who had governed it for about twenty years, and incorporated as part of the British Empire. Dr. Harford-Battersby possessed an intimate personal knowledge of the country about which he was going to speak, and since his return to England, necessitated by a breakdown in health, had in several directions taken an active interest in West African matters. He was the Principal of Livingstone College, an institution which provided elementary medical training for men who were, or who intended to become, foreign missionaries; and he was also the hon. secretary of the Native Races and the Liquor Traffic United Committee.

The development of the British Empire was, said the lecturer, a subject which had occupied the public attention to a remarkable extent during the last few years, and the recent addition to the title of our Sovereign indicated the recognition of the bonds which united us with our fellow-subjects beyond the seas. It was important to remember that the majority of the inhabitants of those vast dominions belonged to races and colour different from our own, and that the greatest problems of our Indian and African Empires were bound up with the welfare of the native races of those lands.

Undoubtedly in the past there was much to regret in the influence of England upon uncivilized races, notably with regard to the history of the slave trade, and on this subject Dr. Harford-Battersby had a good deal to say in different parts of the lecture.

Native races were still sometimes regarded much as if they were objects of interest in a museum, and as if their customs, superstitions, and even cruelties ought to be carefully preserved, and any attempt in the direction of civilizing them, or opening up their countries, deprecated. Another more or less general way of treating the dark races was to altogether ignore their rights, to regard them as mere chattels to be used for the benefit of the white man, and to endeavour to deal ruthlessly with their customs and laws, and to introduce in the place of these various ready-made ill-adapted substitutes. Happily, this attitude was no longer common, and an increasing number of people now took a more reasonable view of the position of the native races, and recognised the desirability of stimulating the native's patriotism and cultivating all that was useful in his habits, only endeavouring to eradicate such as were cruel and barbarous.

The great district now known as Nigeria, and which had been secured to Great Britain mainly by the energy of Sir George Taubman-Goldie, was only one of the numerous British possessions in the West Coast of Africa. The native races of the country might be divided roughly into two great classes—those of Lower Nigeria and more particularly of the Niger Delta, to the south; and those of Northern Nigeria, including that territory known as the Hausa States.

The people of Lower Nigeria, in their natural condition, were pagans of a very degraded type. Cannibalism, infanticide, and human sacrifice, had been practised by most, if not all, of them until they had been brought in contact with British influence. They had no central government and there was a great variety of dialects in the district, owing to the fact that the people of the different tribes, and even of different towns, had but little communication with one another.

In Northern Nigeria, the chief races had adopted, somewhat recently, the Mohammedan religion, and many of them were governed by powerful rulers administering considerable territories, and intercourse between one tribe and another was common.

It was not surprising that the inhabitants of the Niger Delta, as a whole, were a barbarous and superstitious people, considering that their villages were situated in the mangrove swamps. At Brass, however, something had been done to improve the condition of the natives, although the work had not always proved successful.

The Ibos, the most important tribe in Lower Nigeria, were found in large numbers on both sides of the river to the north of the Delta. They were typical negroes, but did not, to any large extent, disfigure their faces like many of their neighbours. Several views were shown of this people, notably one illustrating their method of loading a river steamer with barrels of palm-oil—the chief article of commerce with the British. The Ibo towns usually extended over several miles, the houses being built among the trees and divided into villages. The people had not many handicrafts, but industrial work was now being developed among them, at Onitsha, under the guidance of Bishop Tugwell. They possessed an elaborate system of fetish or Ju-ju worship, which was very closely connected with most of their national customs. Except, however, for their degraded superstitions, they were a very fine race and well repaid any trouble that might be taken with them, and there could be no doubt as to the intellectual capacity of the people if they received suitable training.

The country between this savage region of the Delta and the more civilized district of the Southern Soudan was inhabited by a number of pagan tribes, whose habits and customs,

which gradually improved as one ascended the river, were much superior to those of the Ibos. Of these tribes, short descriptions were given of the Igbiras, Igaris, and the Basas. To the north, again, were the Kakandas, dependents of the Nupes. The first time the lecturer had visited Muve, one of the chief Kakanda towns, he had found it absolutely deserted, with the exception of the principal chief and a few of his followers, owing to the people having fled to escape some of the princes of Nupe, who were out slave-raiding. The country round had been in a state of terror and but ill cultivated, the people hardly caring to grow what would, in all probability, be reaped not by themselves but by the slave-raiders. They were, however, expert fishermen, and had long nets with floats similar to those used in Great Britain. As a tribe the Kakandas were pagans, although Mohammedanism had lately gained some ground amongst them. They were an enterprising people, and well worthy of our attention.

The Hausas, Fulahs, Nupes, and Yorubas were the most important of the races of Northern Nigeria, and of these the Hausas were destined, the lecturer considered, to play the most prominent part in the development of that region which was a portion of the great territory known to the natives as the Soudan. It was, however, with the less-known Nupes that he was better acquainted, and of whom he gave the most interesting account.

At the beginning of the nineteenth century the Nupes had been ruled over by a succession of pagan kings, but about the year 1803 several Fulani mallams had, by intrigue, obtained influence at Rabba, and, with the aid of the king of a neighbouring State, gained practical control. The manner in which the Fulahs had managed to get into their hands the chief power of all the great States of the Central Soudan was one of the most remarkable points in the history of this region; for somewhat similar events to those which had taken place in Nupe had occurred in the Hausa States, in most cases previous to the Fulah conquest of Nupe.

The typical Fulah was entirely different in appearance from the negro races of the Soudan, and his skin was as light as that of some of the dark inhabitants of Southern Europe. The Fulahs were essentially a race of herdsmen, and how these quiet shepherds had become the strong rulers of the great Soudan States would probably always remain a mystery. But their striking intellectual and administrative capacity, combined with the fact that they were devoted Mohammedans, had gained for them an influence which was remarkable.

A detailed description was given of a party of missionaries Dr. Harford-Battersby had joined in a journey to Nupe in 1890. They had adopted the native dress—which consisted of loose flowing robes—and endeavoured as far as possible to dissociate themselves from the British authorities. They had at first settled in the town of Lokja, and used to converse freely with the people. The two leaders of the party, however, had soon unfortunately died, and Dr. Harford-Battersby himself had been invalided home. He had, however, during his short stay made two journeys to Bida, the capital of Nupe, a city about two miles long and one-and-a-half wide. The streets were broad and well kept, the inhabitants courtly and well dressed. It contained schools, where the boys were taught to read and write, and a large market, where daily abundant supplies of various goods—hats, sandals, baskets, ink, paper, live stock, brass and leather goods—made in Bida were sold. But in one corner was the slave market, where often 200 men, women and children would be exposed for sale. The problem of slavery was the chief difficulty to be met in dealing with this region. The question, although to a certain extent doubtless a religious one, was in another direction very practical. In the absence of a more satisfactory currency, slaves formed the most convenient way of paying tribute, and the slave raids were maintained largely because Nupe had to pay a heavy tribute to her liege lords. Slaves were, in fact, Central African bank notes; and, if the means of transport could be improved, and the rulers of the Soudan offered a better currency and helped to solve the labour difficulty, there would be some hope of a better state of things. Patience, firmness and tact were needed by all who had to do with these Fulani rulers; and the lecturer made eulogistic reference to the present Governor of Northern Nigeria, Sir Frederick Lugard, who might be trusted to leave no stone unturned to secure the confidence and co-operation of these powerful rulers.

The position of the Hausas was unique among the natives of Central Africa. Their language was used in commerce, and for administration and religious purposes over a very wide area. Their literature was of the greatest importance, and their mallams men of marked ability. Their towns were surrounded by high walls, and the study of their language and customs was considered to be of such great importance that a special society, the Hausa Association, had been formed to make them better known.

The Yorubas had probably benefited more than any other West African race from their contact with Europeans, and some of the most intellectual members of the negro races had come from this country; but, in the lecturer's opinion, the Hausas were distinctly the superior race, having a remarkable civilization of their own, a well-formed literature, a good system of education, great powers as travellers, and above all made good soldiers.

He hoped that every effort would be made to help forward the education of the native races, particularly in industrial pursuits; that great care would be taken not to denationalise the people, but to encourage them to adopt the best features of European civilization without throwing aside certain of their habits, which, in many cases, were far better adapted to the country than European ones. He laid great stress upon the importance of the question of language study, and, above all, hoped that religious liberty would be granted so far as was consistent with morality, and strongly deprecated the tendency, which existed in some influential quarters, of practically encouraging Mohammedanism under the delusion that it was more suited to the people of the country than Christianity. He considered that Mohammedanism, as a religion, should have fair play, but religious toleration had been one of the proudest boasts of the British nation and he hoped that it might always continue to be so.

The various points of the lecture were admirably illustrated by a selection of lantern views, and the chairman, in proposing the vote of thanks, said that the lecture could not have failed to have given those who had listened to it a deeper interest in all questions bearing upon the administration of the vast territory of Nigeria.

"THE WORKS OF A. N. MAIKOV."

By MR. F. P. MARCHANT.

(ANGLO-RUSSIAN LITERARY SOCIETY.)

At the last meeting of the Society on February 4, Mr. E. A. Cazalet, president, in the chair, a paper was read by Mr. F. P. Marchant entitled "The Works of Apollon N. Maikov."

In his introductory remarks Mr. Cazalet dwelt upon the able and energetic way in which Mr. Marchant had always helped on the work of the Society. He had read interesting papers on Russian authors with whose works he had intimate acquaintance, and almost every number of the Society's *Journal of Proceedings* contained some of his translations of Russian poems and Reviews of books presented to the Society.

While admitting at the outset that the Russian poet Maikov did not command the eminence and influence to which Pushkin, Lermontoff, and even Nekrarsov, had attained, Mr. Marchant expressed his conviction that all who had not as yet read A. N. Maikov's works would be amply repaid by a study of this writer.

Mr. Marchant briefly enumerated the chief incidents of the poet's life. Born in 1821, of a noble and ancient family, he was brought up amidst congenial surroundings at his father's estate near the Troitsko Sergievskaya Monastery. He began his career as a chinovnik in the Ministry of Finance and ended it as an Imperial Censor. The lecturer then proceeded to

a detailed examination of Maikov's work, beginning with a very large collection of short graceful poems dealing with an immense variety of subjects. Some of these headed, *From the Eastern World*, recalled Byron's Hebrew Melodies. A philosophical poem, *The Spirit of the Age*, contained some profound reflections and the idea of the "Zeit-geist" was wonderfully well brought out. Among the series headed *Art* was a charming eulogy of Glinka's songs. The well-known ancient fragment *Song of the Expedition of Igor*, a subject of keen dispute, occupied Maikov for four years, and he produced a lengthy essay and rhythmical version of the poem. But Maikov's finest work was probably the *Two Worlds*, a tragedy showing the struggle of the decaying Greco-Roman world with the new world of Christianity, introducing fresh principles into the lives of men and into their relations to each other. Besides all his original poems Maikov had left a number of translations of works of Longfellow, Hafiz, Sappho, and especially of Heine, for whose writings he had a great admiration.

In conclusion Mr. Marchant said that he did not claim to have given an exhaustive account of Maikov's works, but he hoped that he had said enough to show that their writer was a glory to the literature of his country. No other Russian writer had evinced such a grasp of the spirit of the ancient world and at the same time so entirely sympathised with modern progress. His tone was delicate and refined, his verse musical and artistic. His philosophy and morality, drawn from a wide experience of humanity, and letters breathed a noble and lofty spirit. In short, none could read Maikov without feeling the better for contact with this pure-minded, cultured Russian artist and singer.

Captain Hussey Walsh made some interesting remarks, in the course of which he compared some of Maikov's work to Pushkin's. He also drew attention to the fact that whereas the lives of most Russian poets, Pushkin, Lermontoff, Nekrarsov, etc. were full of trouble and anxieties and were spent in a continual struggle to make both ends meet, Maikov's circumstances seemed to have been easy and comfortable from first to last.

Mr. Kinloch could not agree with Captain Hussey Walsh in his comparison of Maikov to Pushkin; the genius, spontaneity and much of the national spirit of Pushkin were entirely wanting in Maikov's poetry.

Mr. Cazalet, in bringing the meeting to a close, after a hearty vote of thanks to the lecturer, said that he had met Maikov, who was then about forty, at St. Petersburg in the sixties. The President read aloud a translation by Doctor John Pollen of Maikov's poem on the Liberation of the Serfs, which it had been the speaker's privilege to hear read by the Russian poet himself.

PROCEEDINGS OF INSTITUTIONS.

THE ROYAL AGRICULTURAL SOCIETY OF ENGLAND.

At the monthly Council held on the 5th ult. the EARL OF COVENTRY (Vice-President) occupied the chair; 37 new members were elected. Mr. Bowen-Jones, in presenting the report of the Chemical and Woburn Committee, reminded members of the Council that their attention had been drawn to the question, which was now under the consideration of a committee appointed by the Privy Council, of the operation of the Pharmacy Act of 1868, which at present regulated the sale of poisons, especially in its relations to the very numerous articles now used in agricultural and horticultural operations as insecticides, sheep-dips and the like, which contained poisonous ingredients. The Act of 1868 made it illegal under penalties to sell or keep open shop for retailing certain poisons by any other person than a duly qualified chemist. The poisons that could not be sold otherwise were enumerated in Schedule A of the Act, and they could be added to from time to time under Section 2 of that Act by a resolution of the Pharmaceutical Society declaring other articles to be poisons under the Act, provided that resolutions were approved by the Privy Council. The poisons named in Schedule A of the Act of 1868 that were used generally in preparations or compounds for agricultural and horticultural purposes were arsenic and its preparations, corrosive sublimate, strychnine, and all poisonous vegetable alkaloids and their salts. Since the passing of the Act, carbolic acid had been added under Section 2, but through the opposition of the agricultural interest, this substance was excepted "in any preparations used for agricultural and horticultural purposes." The poisons referred to in the original Schedule A of the Act entered largely into the composition of insecticides, vermin-killers, dressings for live stock, sheep-dips, sheep-fly powders, fruit tree- and hop-sprays, and disinfectants, and others might still be added from time to time under Section 2, such as butter of antimony, sulphuric acid, and sulphate of copper, which were extensively employed in agricultural and horticultural operations. The ordinary layman's construction of the Act of 1868 would be that it never was intended to apply to such compounds as he had named, used for the purposes stated. But the action of the Pharmaceutical Society two or three years ago had rather set aside such a contention. Probably the considerable increase in the use of these articles in connection with agricultural and horticultural work which had taken place in recent years might have been the exciting cause for their action, but, be this as it might, some cases were—at the instance of the Council of the Pharmaceutical Society—brought before the Courts, and penalties were claimed against vendors (who were not chemists) of preparations containing arsenic, for weed-killing, and of nicotine used as an insecticide. It appeared therefore, that pharmaceutical chemists had to some extent obtained a monopoly, and there were signs of a desire to extend it. The Poisons Committee had been appointed to enquire and report the alterations which they deemed expedient in Schedule A of the Pharmacy Act of 1868, and to consider whether a third sub-division might not properly be added to the schedule containing substances which, whether sold by pharmaceutical chemists or not, should be labelled or otherwise distinguished. The Chemical Committee were of opinion that it would be inconvenient to farmers and others living in rural districts to be compelled to purchase the articles referred to at no other place than a druggist's shop; that the effect of such action would be to create a monopoly, which would much enhance the price of the commodities purchased to the detriment of farmers and gardeners; and that such action would be strongly resented and resisted by agriculturists generally.

With regard, therefore, to the first subject of reference to the Poisons Committee, "To report the alterations which they deem expedient in Schedule A of the Pharmacy Act of 1868," the Chemical Committee were of the opinion that it was necessary (a) That Schedule A of the Act of 1868 should be more strictly defined than at present (for example, the first item, "Arsenic and its preparations" might be held at present to cover sheep-dips, weed-killers, Paris green—for fruit trees—arsenical soaps, and other articles used in agricultural operations, which were totally unconnected with pharmacy, and were not required to be dispensed, being already prepared in the form in which they are used by the public). Such articles should either be excluded from Schedule A or otherwise excepted from the provisions of Section 15 of the Act. (b) That the power at present given under Section 2 of the Act to the Council of the Pharmaceutical Society to declare by resolution that "any article in such resolution named ought to be deemed a poison within the meaning of the Act of 1868," should, as regards agricultural and horticultural articles, be only exercised with the previous approval of the Board of Agriculture.

With regard to the second reference to the Poisons Committee, "to consider whether a third sub-division might not be added to the schedule, containing substances which, whether sold by pharmaceutical chemists or not, should be labelled or otherwise distinguished," the Chemical Committee thought that it would be reasonable if the sale of what, for convenience, might be called "agricultural and horticultural poisons" should be allowed, provided the article were sold in the condition in which it was received from the manufacturers, the packet, bottle, or other receptacle being kept intact and unopened, and marked outside with an indication of its contents, and of the poisonous nature of the substance. The specific articles

to be included in this third sub-division should be clearly stated in the schedule. In the case of the more virulently poisonous of such preparations, the same precautions as defined in Section 17 of the Act of 1868, as to a register of sales, etc., might also be prescribed; but otherwise, there should be no restrictions or monopoly in the sale of poisonous substances used in agricultural or horticultural operations. He, therefore, proposed to attend the meeting of the Poisons Committee, and give evidence on the lines he had explained to the Council.

The Hon. Cecil Parker presented a report from Professor McFadyean, stating that during the four weeks ending January 25, there had been 67 outbreaks of anthrax, with 100 animals attacked. This was a rather serious increase as compared with the same period of last year, when the outbreaks were 44 and the animals attacked 64. During the same period there had been 229 cases of glanders, as against 209 in the corresponding four weeks of 1901. Swine fever continued to spread, the outbreaks for the last four weeks having been 152, an increase of 20 as compared with the corresponding period of last year. The country continued to be free from foot-and-mouth disease. The miscellaneous researches at the Royal Veterinary College included several cases of poisoning of cattle with yew leaves, the dangerous properties of which still appeared to be unknown to many farmers. A letter had been received from the Devon County Council, forwarding the following resolution and inviting the co-operation of the Society in bringing the subject to the notice of the Government:—"That, in view of the national importance of an adequate supply of sound horses, this Council is of opinion that legislation should be introduced empowering county councils to prohibit the use for hire within their districts of stallions suffering from hereditary disease."

The chairman observed that the question was one of considerable importance. He thought it would be sufficient on the present occasion if a reply were sent to the Devon County Council stating that the Council of the Society were fully conscious of the national importance of an adequate supply of sound horses, and that by their rules, under which breeding animals in the classes for horses at the Society's shows were required to be certified as free from hereditary disease before receiving prizes, they were doing all they could to encourage the breeding of sound horses. A reply in this sense was agreed to, and the report of the Veterinary Committee was adopted.

Lord Moreton, from the Education Committee, reported that the examination for the national diploma in agriculture for the year 1902, would be held at the Yorkshire College, Leeds, on May 5 and the following days, and that the regulations for the examination for the national diploma in dairying next September included a revised syllabus for chemistry and bacteriology.

The Council adjourned until Wednesday, the 5th inst.

THE ROYAL STATISTICAL SOCIETY.

At a meeting of the Society, held on the 18th ult., Dr. GINSBURG read a paper by Mr. F. J. ATKINSON, giving "A statistical review of the income and wealth of British India." After referring to a remark made by Lord Curzon in a speech on the Indian Budget for 1901-02 to the effect that there had been an increase in the mean income of the inhabitants of India between 1880 and 1898 of no less than 11 per cent., and to a statement made by Mr. W. Digby, who criticized Lord Curzon's figures and argued that there had been a diminution of average income of no less than 30 per cent. between the years 1890 and 1900, Mr. Atkinson discussed the question with the view of finding out the true facts. He said that this could not be done with any great exactitude, because there were no statistics of cultivation in some parts of India before 1892-93 and there were difficulties in regard to the estimated yields. He divided the population, for the purposes of his survey, into three classes—agricultural, non-agricultural, and those of sufficient or ample means. Having examined the position of the various sections included in the first class, Mr. Atkinson came to the conclusion that the agricultural income of British India increased from Rs.26'4 per head in 1875 to Rs.35'9 per head in 1895, this being an increase of 39'8 per cent.

A similar enquiry, the results of which were set forth in great detail, convinced him that the non-agricultural income went up from Rs.28'8 per head in 1875 to Rs.34'1 in 1895, or an increase of 18'4 per cent. As these two classes of persons comprised 97'6 per cent. of the entire population, it might be taken that the average annual income of this great mass of people rose from Rs.27'3 in 1875 to Rs.35'2 in 1895, an increase of 28'9 per cent.

In examining the incomes of the third section, Mr. Atkinson gave reasons for doubting the trustworthiness of the income-tax returns, which he was unable to accept as a full disclosure of the position of the people, and he made his calculations on a more extended basis. In the result he put the income of this class as a whole at 74 crores of rupees in 1875 and at 113½ crores in 1895. Summarizing the three sections, he arrived at a conclusion that during the 20 years under review the average income rose 29'5 per cent.—that is to say, from Rs.30'5 per head to Rs.39'5 per head. Alluding to the wealth of British India, he discussed the monetary situation and the amount of hoards and ornaments which the people had put by, and gave an interesting historical survey for the purpose of forming an estimate of the stock of precious metals which the various conquerors had left in the country after successive raids, and of the amount which from time to time had been imported and allowed to remain in the hands of the people. He reckoned that the amount of the totals of the two stores was—in currency, in 1876, 146 crores of rupees, rising to 223 crores in 1900; and under the second head (hoards and ornaments) six crores in 1875, increasing to 8½ crores in 1895. In one of the numerous tables supplementary to the paper there was set out a balance-sheet of India which seemed to show that the actual capital wealth, as distinguished from income, per head of the population, increased from Rs.703'8 in 1875 to Rs.986'6 in 1895, or no less than 40'2 per cent. In conclusion, he gave figures to show the great rise in capital investments of recent years. In 1875 the amount was Rs.20,13,70,000; in 1894, Rs.53,06,51,000; and in 1899, Rs.76,22,69,000. Mr. Atkinson described this increase as a satisfactory indication that the rise in the exchange value of the rupee had stimulated the supply of capital, the greater portion of which came from England.

THE ROYAL GEOGRAPHICAL SOCIETY.

At a meeting of the Royal Geographical Society, held on the 10th ult., the Rev. THOMAS LEWIS read a paper on "The Ancient Kingdom of Congo: Its Present Position and Possibilities." Mr. G. S. MACKENZIE presided in the absence of Sir CLEMENTS R. MARKHAM, the president.

Mr. Lewis, in the course of his paper, remarked that he had laboured in Africa for 19 years, 15 of which he had spent in Portuguese Congo. After referring to the past history of Congo, he alluded to present conditions and said that the native was capable of thinking and reasoning, and therefore could be trained to take a prominent part in the development of his country. Hitherto, both the country and its people had been sadly neglected, and at this critical time in the history of Africa he wished to put in a plea for a fuller recognition of the native element in dealing with African questions. They could not manage Africa apart from the African, and the future of the vast continent, from the Cape to Cairo, would depend, in a large measure, on how they dealt with the natives. He viewed with the deepest concern and distrust the present fever-heat rush of civilization into the heart of Africa. It was not a natural growth, and it did not represent any real development of the native character.

The progress of the country and the advancement of free institutions depended wholly upon the character of the people and upon a long and patient course of training. From that

point of view it was not altogether a disadvantage that the country was in the hands of the least ambitious and self-assertive of European Governments. The very weakness and poverty of the Portuguese had its advantages, for the small military force at their command made them wary of entering upon mischievous punitive expeditions. An important move, in his opinion, would be to protect the principal caravan routes from the interior to the coast stations. Those routes were often closed on account of native disputes and fightings. On such occasions unwary caravans were attacked and plundered of all goods and produce. Even in time of peace it was appalling the amount of blackmailing that went on.

The transport problem was a very serious one, and a final solution of the difficulty would not be arrived at until railways had been constructed from the coast to the chief markets in the interior. The most serious outlook for the future was that the whole district, rich in fertile valleys and productive highlands, was lying idle without any attempt to make use of it. He suggested that the establishment of a school of agriculture and a botanical garden would be a step in the direction of averting the total ruin which threatened in the province. He did not know of a single commodity of commercial value which was produced in the Congo and Lombo countries except what the natives consumed themselves, and yet the soil would grow almost everything.

The future of the ancient kingdom of Congo did not depend on the discovery of gold or copper within its borders, but on the more important discovery of the native himself—the discovery of all that was best in him and all that was noble. For generations he had been looked upon as "a slave," "a piece," and "a hand," but not until the man in him was found and recognized could there be any real progress made in the development of Africa.

COMMERCIAL INTELLIGENCE DEPARTMENT.

CORRESPONDENCE AND ENQUIRIES.

The following are given as specimens of some of the enquiries which have been addressed to, and satisfactorily answered by, the Institute during the past month (February).

* * All communications must be authenticated by the name and address of the writer. Enquiries which would involve special applications or expense will be a matter of arrangement with the correspondent.

- D. & Co., London.—Sugar refiners in Austria.
- H. D., Huddersfield.—Makers of fan folding frames for paper.
- F. W. B., Dulwich.—Cultivation of sponges.
- W. W., London.—Salt trade in the East.
- A. & S., Leeds.—Woods suitable for the construction of an organ for the West Indies.
- B. B. & Co., Seychelles.—Manufacture of fish oils.
- N. V., Norway.—Import duties on goloshes into various countries.
- H. C., Tasmania.—Preparation of anchovies.

REQUIREMENTS REGISTRY.

In order to provide correspondents with an opportunity of making known special "wants" or "needs" in the British Colonies, India, and Foreign Countries, space will be regularly devoted to the publication of approved notices in the IMPERIAL INSTITUTE JOURNAL. Notices, as a rule, should not exceed 25 words in length, for which a charge of 2s. 6d. will be made for each insertion. Special arrangements can be made for longer notices.

SPECIMENS OF FOREIGN AND COLONIAL WOODS desired. Purchase or exchange. Names and localities must be well authenticated. Address—HERBERT STONE, BRACEBRIDGE-STREET, BIRMINGHAM.

THE CURATOR OF THE CANADIAN SECTION OF THE IMPERIAL INSTITUTE is prepared to furnish information about Canadian Trade and to supply names of importers, manufacturers, shippers, etc.

The following trade enquiries have been received at the Canadian Section of the Imperial Institute, from the Curator of which Section further particulars may be obtained:—

- Home Enquiries.**—A firm of manufacturers wishes to hear from Canadian firms who can supply round wood of a tough character, ½ in., ¾ in., 1 in., 1½ in., 2 in., 2½ in., 3 in., 4 in., 5 in., 6 in., 8 in., 10 in., 12 in., 14 in., 16 in., 18 in., 20 in., 22 in., 24 in., 26 in., 28 in., 30 in., 32 in., 34 in., 36 in., 38 in., 40 in., 42 in., 44 in., 46 in., 48 in., 50 in., 52 in., 54 in., 56 in., 58 in., 60 in., 62 in., 64 in., 66 in., 68 in., 70 in., 72 in., 74 in., 76 in., 78 in., 80 in., 82 in., 84 in., 86 in., 88 in., 90 in., 92 in., 94 in., 96 in., 98 in., 100 in., 102 in., 104 in., 106 in., CHARTS AND PLANS.

Published by the Hydrographic Department, Admiralty, during November and December, 1901; J. D. PORTER, Agent, 145, Minories, London, E.C.

No.	New Charts.
3207	Northern entrance to Achill sound, including the approaches to Tonregée.
3215	France, west coast:—Goulet de Fromantine to Pointe de St. Gildas.
3166	West Indies:—Puerto Rico island. Jobos harbour.
3188	Central America:—Gulf of Mexico. Sabine pass.
1284	South America, east coast:—Cape Dos Bahias to Staten island.
3226	South America, east coast:—Port Santa Cruz.
616	Africa, west coast:—Sierra Leone river and anchorage.
3211	Africa, east coast:—Zanzibar island:—Zanzibar harbour.
1988	China, east coast:—Approach to Samsa inlet.
3184	China: Plans in the Yang Tse Kiang:—I-tu reach.
3216	Japan:—Plans on the east coast of Nippon Island:—Nakanosaku. Hakuchi. Naka Minato. Hirakata wan.
3186	Australia, north-west coast:—Mary Ann passage and approaches.
3187	Australia, west coast:—Mangrove islands to north-west cape.
3221	Plans on the south coast of Australia:—Duke of Orleans bay. Goose island bay.
2662	Celebes: Ports in Makassar strait. Plans added:—Lingadang road and Belonlioh bay. Pambauwang road. Chinrana and Binanga bays.

Charts that have received additions or corrections too large to be conveniently inserted by hand, and in most cases other than those referred to in the Admiralty Notices to Mariners.

No.	No.
1991	England, south coast:—Folkestone harbour.
1951	England, west coast:—Liverpool bay.
1975	England, east coast. River Thames:—Kentish Knock to the West Swin.
2693	England, east coast:—Orwell and Stour rivers.
2845	England, Channel islands: Alderney harbour.
1297	Norway:—Lepsö to Ona.
1298	Norway:—Approaches to Molde.
1972	Norway:—Approaches to Trondhjem, eastern sheet.
1343	France, west coast:—Adour river from the entrance to Bayonne.
1422	North America:—Labrador.
327	Lake Huron:—Georgian Bay.
2908	Africa, south coast:—Port Natal entrance.
1003	Africa, east coast:—Pungue river, Beira harbour.
759a	Madagascar:—Cape St. Andrew to Beavato island.
143	Red Sea:—Jebel Teir to Perim island.
1413	Malacca strait:—Rhio strait.
1789	Malacca strait:—Channels between Sumatra and Linga.
941b	Eastern archipelago:—Western portion.
942a	Eastern archipelago:—Eastern portion.
3044	Celebes:—Ujong Jonga to Ujong Kassi.
2636	Philippine islands:—Strait of Makassar, north part.
2391	Philippine islands:—Port Ilo Ilo.
975	Philippine islands:—Port Kavite.
2660b	China sea:—Southern portion.
2357	China, north coast:—Ching Wang Tao road.
1708	Australia, Sheet II:—Albert river.
917	Australia, west coast:—Harbours and anchorages on the west coast.
1700	Australia, west coast:—Freemantle harbour and Gage roads.
1059	Australia, south coast:—Doubtful island bay to the head of the Great Australian bight.
2984	Australia, south coast:—Esperance bay.

THE FROZEN MEAT TRADE OF 1901.

In their review of the Frozen Meat Trade of 1901, Messrs. Weddel and Co. state that, speaking generally, it must be admitted that it was a year of unduly high expectations, which ended in disappointment to both colonial and home dealers. All the disappointment and loss arose through rates being paid in the Colonies higher than at any time were warranted by the position of the market at this end, and not through any unusually low range of values prevailing at Smithfield, where prices during 1901 were well up to the average, for most classes of frozen meat. The drought in Australia caused growers there to demand prices for their limited surpluses which left no margin for exporters to work upon. In New Zealand the opinion was generally entertained that stocks in that Colony were shorter than was actually the case, the light shipments made during the earlier part of the year lending colour to the idea. Freezing companies and speculators in the colonial markets paid extreme prices for both mutton and lamb, and found difficulty in reselling to British operators without at once facing a loss. In many instances, rather than accept that position these highly priced purchases were sent on to London for sale on consignment, but with unfortunate results.

The total quantities imported during the year from both Australia and New Zealand were by no means excessive; but the Australian export was most erratic, and the arrival of New Zealand shipments was not well timed, receipts of mutton and lamb in the second half of the year being much too heavy for the demand at that season. Supplies from the River Plate increased in volume steadily throughout the year, so that the belated shipments of mutton from New Zealand had to face the further disability of competing with heavy arrivals from the Argentine Republic.

The war in South Africa, again, had some influence upon the course of the market. Large quantities of beef and mutton from Australia were delivered at the Cape, instead of being brought on to London, as would probably have been the case under ordinary circumstances; and to that extent the home market was relieved. On the other hand, the general slackening of trade throughout the country, which was so noticeable during the latter half of the year, was doubtless due, to some extent, to the prolongation of the war.

The Board of Trade returns prove that the frozen meat trade in 1901 was of greater magnitude than in any previous year, the weight of frozen mutton, lamb, and beef imported from all resources being 226,095 tons, as against 209,231 tons in 1900, and 201,833 tons in 1899. Over and above the heavy increase in frozen meats, the returns show that the import of American chilled beef was heavier than it had ever been before, the total receipt being no less than 159,014 tons.

Seldom was there any excessive supply of home-fed meats on the market, and the prices of English beef and mutton were maintained fairly steady throughout the year. In September there was rather a heavy run of Scotch lambs on the market, and prices at that time fell to a low ebb; but this was quite exceptional, and neither home-fed nor Continental supplies, at any time during 1901, had much direct influence upon the course of values for frozen meats: certainly the market fluctuations of the two classes of meat appeared to be, to a very great extent, independent of each other. Extended experience only confirms the views set forth in these columns in 1896 that the importation of frozen meat has practically created an entirely new set of meat consumers in this country, largely, of course, amongst the working classes, who are in consequence very much better fed than can have been the case fifteen or twenty years ago.

With regard to the general outlook, the report says that for ten years past the flocks and herds of the United Kingdom have remained almost stationary, while the population has increased by 3,720,000 persons. The utmost that can be claimed for the home supply of beef and mutton is that it has maintained its volume in recent years, but it does not nearly keep pace with the growth of population. This explains why the prices of home-fed beef and mutton have not declined in view of the vast increase in the importation of frozen meat.

Despite the persistent reduction revealed by the official returns of flocks and herds in the United States from 1893 to 1900, the exports thence of cattle, sheep, and beef all showed great expansion in 1901. It is, therefore, of comparatively little use to endeavour to estimate the shipments in the near future on the basis of these returns alone. Although prices may be low here, the export of cattle or beef to Great Britain goes on irrespective of that fact, provided other conditions in the States call for the relief of the local markets; while, if prices are high in England, the export from the States appears to be capable of immediate expansion. The shortage in the 1901 maize crop, however, and the consequent forced selling of

cattle during the past three months, have already led to a marked advance in prices of fat stock in the States. Trade there is decidedly brisk at present; and these considerations warrant the expectation that there may be some slackening in the export trade in the near future.

Export of chilled beef from Canada may show some slight growth; and small additions to the total supplies of meat may arrive in the form of chilled beef from the Argentine Republic; but the relation of these two factors to the trade as a whole must remain unimportant for some time to come.

A good deal of interest is being shown by the Russian Imperial Government in the development of a meat export trade to this country. Small quantities of Russian beef have come to hand in recent winters, but the quality and condition were not good enough to command encouraging results. Possibly, with proper transit facilities and Government encouragement, a larger trade might be successfully carried on; but it is not likely to assume any importance during the next twelve months.

Further satisfactory experience has been gained in South Africa during the past twelve months of the suitability of Australian frozen beef and mutton for military purposes, and the British Government has just recently called for tenders for extensive supplies to be delivered there during 1902. These will probably be drawn mainly from Australia, and, together with the quantities to be delivered for military consumption in the Philippines and at the Mediterranean ports, must materially curtail the export from the Commonwealth to the United Kingdom.

The latest cable advices from Australia point to a continuance of the drought conditions over a considerable part of the continent, and there is consequently little or no prospect of heavy shipments of either beef or mutton being sent forward in the immediate future. The supply of lambs is already nearly exhausted, so that receipts in the coming spring are certain to be moderate. From New Zealand complaints are general as to the backwardness of the season, but apparently the output of both mutton and lamb is expected to be at least equal the deliveries of last season. Beef is at present scarce and dear, with only slight prospect of last year's export being increased. In the River Plate the season is reported to be unusually favourable, and everything points to a still larger output of both beef and mutton in the near future. The existing freezing works will continue to operate to their full capacity, and in April next the new works at Bahia Blanca are expected to be opened. It is believed by those engaged in the trade that even if the export of live cattle and sheep be resumed the operations of the freezing works will not thereby be checked to any material extent.

The demand, apart from the normal increase resulting from growth of population, must be influenced to a large extent by the general state of trade in this country. At present that is only moderately good, and a continuance of the war will almost certainly aggravate the existing dullness. As soon, however, as peace is secured, the spurt which must follow in all kinds of business may be expected to benefit the meat trade almost immediately. On the whole, the probabilities are mainly in favour of a fairly good year, with possibly some early improvement in prices owing to short shipments afloat and light home supplies.

NEW BOOKS, etc.

CASELL AND COMPANY, LTD. (London, 1903.) *With the "Ophir" round the Empire: an account of the tour of the Prince and Princess of Wales, 1901.* By WILLIAM MAXWELL, Special Correspondent of the *Standard*. Illustrated. 8vo., pp. xviii, + 332. (Price, 6s.) This is an admirable record of the memorable tour of their Royal Highnesses the Prince and Princess of Wales, during which they journeyed nearly 47,000 miles, and visited seventeen of the British possessions. The author, who accompanied the expedition in the capacity of newspaper correspondent, has his letters to the *Standard* in the present volume, and with the addition of new matter, has made a very attractive and readable book, containing a graphic and striking description of this remarkable voyage which marks an epoch in the history of the Empire. One of the chief objects of this long tour was the opening at Melbourne on May 9th of the new Federal Parliament of the Commonwealth of Australia, but the most important result has been that it has brought prominently to notice the intense patriotism and love for the Mother-country existing in all her colonies without exception. In his introductory observations the writer says that "in Canada, in Australia, in New Zealand, in South Africa, and the Islands of the Sea, the presence of the Prince and Princess has quickened the spirit of brotherhood, and brought us nearer to the accomplishment of the desire of statesmen and patriots. Under the shadow of the sword we have seen that pride of race and loyalty to the Empire, an undying impulse. . . . In years to come, when destiny has set them on the throne of this great Empire, the Prince and Princess will not be strangers to their people in the uttermost ends of the earth. They have noted the material, moral and social condition of the people, and the resources and potentialities of their countries. They have been the central figure in a succession of brilliant ceremonies. Everywhere they were received with a heartiness that must have assured them of the sincerity and attachment of the colonists. In the colonies it is recognised that loyalty lies at the root of every powerful nationality, and that security and progress are made certain by the unity of the Empire, by the defence of its rights, and the maintenance of its prestige." Mr. Maxwell's book will be found most interesting as regards the great variety of people and races that live under the British flag. The volume contains numerous photographic illustrations of a highly artistic character.

GEORGE BELL AND SONS. (London, 1902.) *The Life of Napoleon I., including new materials from the British Official Records.* By JOHN HOLLAND ROSE, M.A., late Scholar of Christ's College, Cambridge. With illustrations, maps and plans. In two vols. Large post 8vo., pp. 594 + 512. (Price, 16s.) The life of Napoleon Bonaparte has often been written, from various points of view, conveying very different ideas of the merits and faults of this great military genius. The writer of this present work has had the special advantage of being able to search the English Foreign Office records, and his examination has yielded much valuable information on the subject. These records show that the policy of the English Government, though weak at first, became sound and consistent, and grew stronger towards the end. He has also consulted nearly all the works relating to the period that have already been published, and has produced a remarkably clear and lively account of the wonderful career of this "scourge of Europe." He has dealt almost exclusively with the political and military aspect of Napoleon's life, only referring to his private life where it is connected with public affairs. Mr. Rose's work is written in a concise yet graphic style, suitable to the stirring incidents and momentous events portrayed, and is free from any personal bias. The numerous illustrations and maps inserted in the volumes add much to their interest, and there is a useful index appended.

GEORGE PHILIP AND SON. (London, 1902.) *Mosquito Brigades and how to organise them.* By RONALD ROSS, F.R.C.S., D.P.H., F.R.S. 8vo., pp. vi. + 98. (Price, 3s. net.) The discovery made by Major Ross that the germs of the most important tropical diseases, malarial fever, yellow fever, and elephantiasis, are inoculated into human beings by the bites of mosquitoes, has caused a revolution in tropical hygiene. In this volume the author gives full and clear instructions as to the methods to be adopted for the destruction of these pests, and directions as to the organisation and duties of brigades of men to be employed in the extermination of the larvæ and full-grown mosquitoes. The information given is based upon experience gained during many years' study of mosquitoes in various parts of the world, and more especially upon the actual results of the operations now being carried on by the Liverpool School of Tropical Medicine in West Africa. Already the system of killing mosquitoes at each place where yellow fever breaks out is bearing fruit, for it is stated that at Havana no case of yellow fever occurred during last November, a condition which has not obtained for many years.

JOHN MURRAY. (London, 1901.) *China, her History, Diplomacy and Commerce from the earliest times to the present day.* By E. H. PARKER, formerly H.M. Consul at Kiangchow. With maps. Second impression. 8vo., pp. xx. + 332. (Price, 8s.) The writer of this interesting book has had many years' residence in China, having spent a quarter of a century at many of the ports, besides travelling through some of

the provinces, and also in Corea and Burma. He has already written many works on subjects connected with the Chinese Empire, and was, therefore, well prepared for an examination of the Chinese historical records from which the greater part of the present work has been compiled. In the preface, Mr. Parker says that, in struggling through the voluminous chapters of native records on "barbarians," he was greatly struck with the fidelity of the Chinese annals. After giving a short geographical and historical sketch of the Empire, Mr. Parker describes the great trade routes which have been in existence from the earliest times, and are, with one or two exceptions, exactly the same now as they were 2,000 years ago, both by land and sea. "The marts, with similar rare exceptions, are either the old marts or are near them, or have a special traceable reason for their modified existence." An account is next given of the beginnings of the relations between China and foreign countries, with a list of the numerous treaties that have been entered into from the first treaty with Russia in 1689, down to that with the Congo State in 1898. After describing the various nomad tribes that have harassed the borders of China from time immemorial, the author deals with the conditions of modern trade and the various ports that have been opened to it, together with the methods of collecting the revenue, the salt gabelle and *likin*. The volume conveys a clear and vivid idea of the personal characteristics of the Chinese, which will serve to make them better known to the outside world. An excellent glossary and full index are appended to the work, and numerous maps are inserted to illustrate the text.

"KNOWLEDGE" OFFICE. (London, 1902.) *Wireless Telegraphy: a Popular Exposition.* By G. W. DE TUNZELMANN, B.Sc., M.I.E.E., &c. Second edition. 8vo., pp. 104. (Price, 1s. 6d.) This little volume is based upon a series of papers on wireless telegraphy which were published in *Knowledge*, and presents a popular account of this new means of communication in a manner adapted to any readers who are interested in knowing something of the historical development and practical working of electric telegraphy without the aid of connecting wires, which has now been shown to be of great value to commerce. The book is written in a very clear and lucid style, and with two exceptions, without the use of those mathematical formulæ which are incomprehensible to the non-scientific reader. Within the last month, Signor Marconi has proved the practicability of sending messages across the Atlantic by wireless telegraphy, and further developments may shortly be looked for.

NEW SOUTH WALES GOVERNMENT PRINTER. (Sydney, 1901.) *Picturesque New South Wales: An Illustrated Guide for Settler and Tourist.* Prepared under the direction of T. A. COGHLAN. La. 8vo., pp. 123. This beautifully illustrated guide book conveys to settlers and tourists a remarkably clear idea of the natural wealth of the State of New South Wales, and the splendid scenery which it possesses. The descriptive letterpress is written in a popular style which cannot fail to arouse interest in this highly favoured country. The advantages it offers to the commercial man, as well as to the agriculturist and the artist, are graphically described; the numerous illustrations are all from photographs and greatly add to the attractiveness of the book, which has been produced under the supervision of Mr. Coghlan, the well-known Government Statistician of New South Wales, a fact which guarantees the accuracy of the information given.

THE OXFORD UNIVERSITY PRESS. (London, H. PROWDE, 1901.) *The Relations of Geography and History.* By the Rev. H. B. GEORGE, M.A. With two maps. Crown 8vo., pp. 296. (Price, 4s. 6d.) The relations of geography and history are both intimate and important, and geographical influences have accounted for much that has happened or is happening in the world. Geographical knowledge affords valuable data for solving historical problems that without such knowledge would be enveloped in doubt and obscurity, and the movements and migrations of population on the surface of the globe have been largely governed by geographical contours and conditions. In this volume the effects of these geographical circumstances are well traced, and some striking examples are given of the way in which historical events have been shaped, especially in connection with the wars that have been waged in Europe. The chapter on the Alpine passes is specially interesting. A knowledge of the geography and climate of a country helps greatly in explaining its history, more particularly that of earlier times, and the study of the connection of history with geography, as set forth in this volume, will be found of great value by all students of the subject.

T. FISHER UNWIN. (London, 1901.) *The West Indies and the Empire: Study and Travel in the Winter of 1900-1901.* By H. DE R. WALKER. With coloured map. 8vo., pp. 264. (Price, 7s. 6d. net.) This volume gives in an amplified form the contents of a paper which Mr. de R. Walker read in June last before the Royal Colonial Institute, with new additional matter. It presents in a lucid and graphic manner the present state of the sugar industry in the West Indies, and the development of other resources. The resuscitation of the sugar industry is essential to the permanent prosperity of these Colonies. The social condition of the negroes, who form the bulk of the population, is fully dealt with, and the introduction of the indentured East Indian is shown to have been a benefit. With regard to taxation and administration the author is in favour of the union of as many of the West Indian Colonies as possible under one government, and that, in the interests of all sections of the community, direct government under the Crown is preferable throughout the West Indies to any system of representative institutions. There is a chapter on travel in the West Indies which contains much information useful for tourists.

CITY BRANCH OF THE IMPERIAL INSTITUTE, AT 112, CANNON STREET, LONDON, E.C.

The CITY BRANCH OF THE IMPERIAL INSTITUTE embraces:—

1. A News Room, supplied with:—
 - (a) The chief British Industrial and Commercial Periodicals;
 - (b) Many United States, German, and French Commercial Periodicals;
 - (c) Commercial Periodicals of the principal Colonies and of India;
 - (d) Market reports, prices-current, and statistics.
2. An Enquiry Office, in telephonic communication with the Commercial Information Office of the Imperial Institute at South Kensington. Enquiries relating to industrial, commercial, and other matters connected with the Colonies, India, and Foreign Countries, are received and promptly dealt with, and samples of products from the Colonies and India, stored at the Imperial Institute, can be inspected or obtained. Expert valuation will be furnished of samples submitted for that purpose.
3. The News Room is *free to Fellows* of the Institute, as is also the Enquiry Office for obtaining such information as does not involve special research or correspondence.
4. A *subscription* of the sum of one pound per annum, payable in advance, secures the *free use* of the News Room, and the supply, free of charge, of information not involving special research or correspondence.
5. Subscribers of one pound per annum are also entitled to inspect, *free of charge*, any maps or charts included in the Map Room collection at the Imperial Institute, South Kensington, and to consult any works, or official papers, included in the Institute Library. Passes admitting to the Library or the Map Room for the foregoing purposes will be issued, as required, on application to the Clerk at the City Office.

6. *Non-Subscribers* to the City Branch can be supplied with information upon the following terms:—

- (a) *First* enquiry, not involving special research or correspondence, *free*.
- (b) For each subsequent enquiry, not involving special research or correspondence, one shilling.
- (c) For each enquiry, involving special correspondence, or interviews with home-experts, etc., five shillings.
- (d) For each enquiry involving Colonial or Foreign correspondence, ten shillings; or by special arrangement, if likely to be voluminous.

7. *Subscribers* will have to pay the charges specified under (c) and (d) in the foregoing clause: *Fellows* will only be required to reimburse the Institute any out-of-pocket expenses incurred in connection with enquiries coming under those heads.

8. The Information Department will undertake to obtain analytical or other examinations of samples by competent Experts, upon payment, by persons submitting them, of the usual professional fees, to be previously specified, and agreed to by the applicant.

9. The Institute will undertake to procure, and supply, at cost price, translations into any language, of trade circulars, prices-current, etc., and the conversion of weights, measures, coinages, etc.

SCHOOL OF MODERN ORIENTAL STUDIES.

Founded by the Imperial Institute in union with University College and King's College, London.

In 1887 it was suggested that a school of Modern Oriental Studies should be organised as a branch of the Institute, in imitation of the very efficient establishments of this kind which are carried on, with Government resources, in France, Germany, and Austria. The promulgation of this proposal led to negotiations with the authorities of University College and King's College, London, which resulted in their co-operation with the Institute in the establishment of the School. A Special Committee having been appointed to decide upon a system of work, it was arranged that classes for instruction in the Oriental languages required by students qualifying for examinations for the Indian Civil Service, should be held at University College, while modern Oriental languages, other than the Indian languages, should be taught at King's College, and that the Imperial Institute should undertake the general administrative and financial work. The School was officially opened in January, 1890, when an inaugural address was delivered by Professor Max Müller at the Royal Institution, in the presence of His Royal Highness the Prince of Wales. The daughters of the late Colonel W. J. Ouseley (Bengal Army) have established and endowed, in his memory, three scholarships, in Arabic, Persian, Hindustani, and other Oriental languages, in connection with the School, each one of the value of not less than £50 per annum. The following Scholarships have already been awarded:—

YEAR.	SUBJECT.	EXAMINERS.	AWARDED TO.
1892	Arabic .	{ Dr. WELLS Prof. SALMONÉ	No Competitors.
1893	Arabic .	Dr. WELLS	Mr. HENRY LEITNER, junr.
"	Persian .	{ Mr. JOHN T. PLATTS MIRZA HUSSEIN KULI KHAN	Mr. E. DENISON ROSS.
1894	Hindustani .	Mr. JOHN T. PLATTS	No Competitors.
"	Persian .	Dr. ROBERT BRUCE	Mr. DIWÂN TEK CHAND.
"	Chinese .	Sir THOMAS WADE	No Competitors.
1895	Turkish .	Dr. WELLS	Mr. L. STENNETT AMERY.
"	Hindustani .	Mr. J. T. PLATTS	Mr. ASGHAR ALI.
"	Chinese .	"	No Competitors.
1896	Burmese .	Gen. R. D. ARDAGH	Mr. LEE AH YAIN.
"	Arabic .	Dr. WELLS	Mr. H. G. SARWAR.
"	Marathi .	Mr. J. W. NEILL	Mr. V. R. PANDIT.
1897	Gujarati .	Dr. S. A. KAPADIA	Mr. RUSTUM D. N. WADIA.
"	Persian .	Mr. J. T. PLATTS	Mr. P. S. PATUCK.
"	Chinese .	Mr. W. A. PICKERING, C.M.G.	No award.
1898	Bengali .	Prof. J. F. BLUMHARDT	Mr. B. C. GHOSH.
"	Turkish .	Dr. WELLS	Lieut. A. M. SETON, R.A.
"	Chinese .	"	No Competitors.
1899	Arabic .	Dr. WELLS	Mr. G. A. KHAN.
"	Persian .	Dr. ROSS	Mr. R. M. DAVIS.
"	Sanskrit .	Prof. C. BENDALL	Mr. S. K. GHOSE.
1900	Hindustani .	Mr. J. T. PLATTS	Mr. N. HAGOPIAN.
1901	Marathi .	Prof. J. W. NEILL	Mr. J. R. MARTIN.

An OUSELEY SCHOLARSHIP of £50, tenable for two years, will be awarded this year, should sufficient merit be shown, for proficiency in PERSIAN. *No person will be admitted to competition for a Scholarship in a language which is his own mother tongue, nor for a Scholarship in a language allied to his mother tongue.*

The examination takes place early in July, 1902.

Competitors must give notice on or before July 1, 1902.

The ages of Candidates are to be above 17 and under 25 years on January 1 of the year of examination.

Further particulars may be obtained from the Secretary, S.M.O.S., Imperial Institute, S.W.

GENERAL INFORMATION FOR INTENDING STUDENTS AT THE SCHOOL.

The classes which the "School of Modern Oriental Studies" comprises, are divided under two heads. DIVISION I. includes classes for all Oriental Languages especially required by Students qualifying for examinations for the Indian Civil Service, the instruction being of the same character as that provided for some time past at University College and at King's College. This Division includes instruction in Sanskrit, Bengali, Hindi, Hindustani, Tamil, Telugu, Punjabi, Pali, Marathi, Gujarati, Arabic, and Persian.

DIVISION II consists mainly of classes for Modern Oriental Languages other than the Indian Languages. The courses of tuition are of a practical rather than of an academic character; they have particular reference to commercial and official requirements and to the facilitation of colloquial intercourse with natives of Oriental Countries.

It is in contemplation, so soon as the number of students warrants the expenditure, to secure the services of native readers and teachers of conversation in connection with the classes of this Division.

The classes under this Division are conducted at King's College, where arrangements will also be made for the establishment of evening classes.

The Languages taught in Division II. comprise Colloquial Arabic, Armenian, Modern Greek, Colloquial Persian, Russian, Turkish, Chinese, Burmese, Japanese, Malay, and Swahili.

Arrangements have been completed by the Managing Committee and approved of by the Governing Bodies of the Imperial Institute and of the two Colleges, for the pursuit of studies relating to the history, literature, commercial and physical geography, political economy, and the natural and industrial resources, of the countries and districts in which the various languages are used.

Special Lectures or courses of Lectures will be delivered from time to time, in connection with the School, by experts or specialists, in any of the foregoing subjects.

There are three terms, of about ten weeks, in each year, as follows:—

SPRING TERM—commencing about the middle of January.

SUMMER TERM—commencing early in May.

AUTUMN TERM—commencing about the middle of October.

A fee of THREE GUINEAS per term will have to be paid, in advance, by each Student for each Language taken up for instruction. This payment will entitle the Student to the use, within the College, of text books, dictionaries, and works of reference required in connection with the particular Language taught, and to the use of all the facilities which it is proposed to secure in the development of the School.

Accommodation is provided at the Imperial Institute to enable Students to pursue their studies at hours when the classes are not held. The Libraries of both Colleges will be open to Students in any of the classes of the School, during the usual hours of study.

Intending Students should communicate with the Secretary at the offices of the Imperial Institute, London, S.W., where the registration of Students will take place, and where all information regarding the School will be supplied.

MONTHLY COMMERCIAL AND INDUSTRIAL SUMMARIES.

GENERAL COMMERCE AND INDUSTRY.

UNITED KINGDOM.

British Corn.—The following statement gives the average price of British Corn during the four weeks of February this year, as compared with February, 1901:—

1901.			1902.		
Wheat.	Barley.	Oats.	Wheat.	Barley.	Oats.
26/7	25/7	17/8	27/4	26/7	20/2
26/8	25/7	17/7	27/2	26/9	20/3
26/4	25/4	17/7	26/11	27/5	20/3
26/1	25/-	17/7			

Fisheries.—The total amount of Fish, excluding Shell-fish, landed on the English and Welsh coasts from the fishing grounds during January this year was 479,002 cwt., value £519,163, as against 488,296 cwt., value £474,808, during the same month last year. The value of Shell-fish was £24,391 as against £26,582.

COLONIES.

British Guiana.—**GOLD-MINING.**—Commenting on the decreased output, which may be due to some extent to extra attention given to diamond-mining, the *Demerara Daily Chronicle* says that influences are now at work which promise to promote the development of the industry very materially in the near future, outside capitalists having been engaged in introducing for mining purposes machinery of the most advanced character, and it may reasonably be assumed that they are satisfied that the additional outlay will be justified by the results. Mechanical dredging is being tried on the Barima with satisfactory results. The advantages seem to be that a relatively small amount of capital is required for the starting of operations, and that, comparatively speaking, only a few labourers are needed to keep the dredger running. On the authority of "a colonist interested in the gold industry" an expert who has prospected in the Barima river estimates that "a 500-ton dredger working 200 days at 24 hours per day will make a profit of £25,000 sterling. The cost of a dredger would be about £3,000." The experiment now in progress should determine the amount of reliance that can be placed on what is rightly described as a "remarkable anticipation." "One circumstance," the *Demerara Chronicle* remarks, "must be borne in mind; dredging is not an undertaking for the local man with no experience of the system and with little or no capital. Men who mean business, with money to support them, should have the prior claim for concessions, and the indiscriminate granting of large areas to applicants who obtain them solely for the purpose of speculation ought carefully to be guarded against. This class of applicant is but a stumbling-block to progress." The prospect of a considerable development of the gold-mining industry in British Guiana during the course of the present year, however, is not restricted, it appears, to the development of dredging. The "hydraulicizing" system is also to be extended to the goldfields. Options have been secured with this object in the Potaro district, and the installation of an elaborate hydraulic plant at Omai is approaching completion. The hydraulic and the dredging processes are the two methods most suitable to the conditions under which gold is found in British Guiana.

Canadian Trade with the West Indies.—The Dominion Statistician, Mr. George Johnston, has gathered together an interesting collection of papers dealing with trade between Canada and the West Indies which will be forwarded to the Commission which is to investigate business openings in the West Indies on behalf of the Canadian Manufacturers' Association. The figures show that, in spite of the outlay of a large sum of money to promote trade between Canada and Jamaica, Trinidad, Barbadoes, and the rest of the islands, business has steadily declined.

Cape Colony.—**TRADE IN 1901.**—The imports for 1901 were £23,990,543, as compared with £19,678,336 in 1900 and £19,207,519 in 1899. The specie imports were £2,575,800, against £2,516,520 in 1900 and £3,836,100 in 1899. Of course the expansion in imports is chiefly due to the presence of the troops and the expenditure on supplies. The exports are a better test of the reviving trade of the Colony. The total for 1901 was £10,873,273, as compared with £8,147,670 in 1900 and £23,247,258 in 1899. The principal items in the exports were colonial produce, diamonds and gold, all of which showed increases. How much South Africa depends on the Rand gold industry is shown by the fall in exports between 1899 and 1900. Of this fall £13,478,888 was due to the cessation of mining. The trade of the Cape with the Transvaal amounted to £1,162,000 last year, against £188,500 in 1900, and the trade with Rhodesia was £842,900, against £414,900.

New South Wales.—**THE SYDNEY HARBOUR COLLIERIES.**—Mail advices report the striking of coal in the Birthday shaft of the Sydney Harbour collieries. The coal is said to be of excellent quality, so that in addition to the facilities offered by a splendid harbour, Sydney now possesses good coal. The arrangements are such that the coal can be delivered direct from the screens into the hold of the vessels waiting to receive it, and the work will be accomplished by powerful machinery with the greatest expedition. As there is a depth of 26 feet alongside the wharf at low water, and the length (580 feet) is adequate for all reasonable requirements, it would appear that very large vessels can coal there with great despatch and convenience. The advantage that will be possessed by the Harbour collieries in this respect is obvious.

Queensland.—**PEARL SHELL INDUSTRY.**—In the annual report of the Marine Department, the Queensland Inspector of Fisheries (Mr. J. R. Tosh) states that the pearl shell industry of Torres Straits has reached a critical stage. From the time when the earliest shellers, each with a schooner and a few open boats, picked up shell at practically low-water mark, there has been a gradual evolution in skill, in appliances, and in organisation, to meet the increasing difficulty of obtaining shell. Year by year the shell-bearing area has been pushed further from the shore, and year by year the boats have ventured further afield. The grounds will be more thoroughly worked than ever before, and this means that the depletion of the known areas will be materially hastened. Unfortunately, no one knows how far the shell-bearing area extends, and in the circumstances it is difficult to say how we stand for a supply of shell for the coming years.

Unless some precautions are taken, one can look forward to a time when all the shelling grounds within a distance to be reached from Thursday Island will have been worked down to a payable limit; at that point the fleets will sell out or depart in search of pastures new, and the fishery will be practically closed down. There is no telling when the paying limit will be reached.

INDIA.

Afridi Wax-Cloth.—According to the *Times of India*, Mr. George Watt, the Reporter on Economic Products, has succeeded in inducing the Afridi wax-cloth workers to impart the secret of their craft, which has hitherto puzzled all enquirers into Indian industries. Afridi wax-cloth, a kind of raised colour painting on cotton fabrics, has been almost from time immemorial, and is, a well-known product of certain workshops in Peshawar, Lahore, Calcutta and Bombay; but until Mr. Watt set about his enquiries, complete ignorance prevailed, outside the circle of artisans, as to the constitution of the medium employed. With the assistance of Mr. Roe, the Secretary to the Peshawar Municipality, Mr. Watt was able to ascertain that the medium, known as *rogan*, is a peculiar product of the safflower seed. The method of preparation, which is carried on entirely at Peshawar, is to boil the oil—expressed from the seeds by cold pressure—for 12 hours, and then throw the heated fluid into shallow pans of cold water. Under this treatment it swells up into a thick, jelly-like substance, which is the *rogan* of commerce. Before being applied to the cloth, it is mixed with some mineral colour and drawn out into fine threads on a pointed style with which the pattern is traced. The operators, who are invariably Afridis, attain a very high degree of skill, and possess marked artistic abilities. The weight of Afridi wax-cloth—an Afridi woman's costume would turn the scale at over 13 lb.—makes it unsuitable to articles of European dress; but the ever-increasing demand for household drapings gave a ready outlet for the Afridi artisan's skill, to which he has readily adapted himself. Careful tests made in Calcutta also showed that as a waterproofing material, or as a material to be used in the manufacture of linoleum, *rogan* has a distinct claim to careful consideration, and is, in some respects, superior to linseed.

The Mysore Sugar Industry.—In the course of an interesting note on the Mysore sugar industry, Dr. Lehmann said that notwithstanding the fact that iron mills had taken the place of the old wooden mills, and much better extraction of the juice obtained, yet, when viewed in the light of the progress made in other countries, the sugar industry was one of those decaying industries which it was in the interests of the State to revive. The native refining industry was practically already dead in Mysore, and the so-called native refined sugar which was sold to the bazaars was simply sugar refined in the large factories, imported into the State, and re-melted in the bazaars. The fate which had overtaken the native refining industry was sure to overtake the jaggery-boiling industry sooner or later, and in fact the sooner jaggery-boiling was abolished the sooner the sugar industry would regain some of its former splendour. The methods of cultivating the cane would also have to be improved. The same quantity of sugar-cane which produced 100 lb. of jaggery, from which 50 lb. to 62 lb. of refined sugar could be obtained, would give, if manufactured directly into refined sugar by improved machinery, about 70 lb. to 75 lb. of refined sugar. Such a loss evidently made all the difference between a flourishing and a crippled industry. Waste of fuel and other losses and drawbacks in jaggery-boiling had to be added, but could not well be taken into account, as they were to some extent off-set by drawbacks in whatever other system might be introduced. Still, the loss of 151 lb. on every 75 lb. of refinable sugar justified almost any effort to save it, and although the loss might be to some extent overcome—to what extent Dr. Lehmann was not prepared to say, but soon hoped to make experiments in that direction—by improving the system of jaggery-boiling, still, so long as jaggery-boiling was continued, the loss must go on to a very large extent, as was proved by all the leading sugar-producing countries having long ago abandoned all systems which were in any way similar to that in vogue in India.

FOREIGN COUNTRIES.

Exports to Guatemala.—The Consul-General of Guatemala calls the attention of shippers and merchants trading with that Republic to the regulations that all consular invoices, no matter from what port the goods are shipped, must be legalised solely by the Consul of Guatemala (where any) resident in the city in which the exporter's firm is domiciled; and that consular invoices must be dated at the place in which the exporter's firm is domiciled, and both the invoices and the sworn declarations must be signed by an authorised member of the exporter's firm.

Germany.—**TRADE RETURNS.**—The Imperial Statistical Office has reported the preliminary figures regarding Germany's foreign trade in 1901, showing that the total imports amounted to 44,304,857 tons, compared with 44,652,288 tons in 1900. There was a decrease of more than a million tons in the coal imports, and more than 500,000 tons in the iron and timber imports. The total exports amounted to 32,363,395 tons, compared with 32,681,747 in 1900. The increase in iron exports was nearly 800,000 tons, while exports of iron ore and of coal fell off heavily. The value of the imports for the last calendar year was estimated at 5,967,000,000 marks, as compared with 8,043,000,000 marks in 1900. Exports last year were valued at 4,759,000,000 marks, as against 4,753,000,000 marks in the previous year. The returns indicate very clearly the extent to which export prices have fallen, the substitution of 800,000 tons of manufactures of iron and steel, most of which were quite highly manufactured, for exports of iron ore and coal, failing to increase the value of the total exports appreciably.

United States.—**PRODUCTION OF PIG-IRON IN 1901.**—According to the American Iron and Steel Association, the production of all kinds of pig-iron in the United States in 1901, was 15,878,354 gross tons, against 13,789,242 gross tons in 1900 and 11,773,934 in 1898, the total increase in 1901 over 1900 being a larger one than the "boom" year 1899 showed over 1898. The whole number of furnaces in blast on December 31, 1901, was 266, against 232 on December 31, 1900.

The States supplying the principal production are shown in the following table:—

	Gross tons or 2,240 lb. (includes spiegeleisen).
	1901.
Pennsylvania	7,343,257
Ohio	3,326,425
Illinois	1,596,850
Alabama	1,225,212
Virginia	448,662
Tennessee	337,139
Maryland	303,186

Production according to fuel was as follows:—

	Gross Tons.
Bituminous	13,782,386
Anthracite	1,712,527
Charcoal	360,147
Charcoal and Coke	23,294

LABOUR MARKET.

General Statistics.—The *Labour Gazette* reports that employment improved during January, but it is not so good as a year ago. In the 151 trade unions, with an aggregate membership of 553,218, making returns, 24,470 (or 4.4 per cent.) were reported as unemployed at the end of January, compared with 4.6 per cent. in the 144 unions, with a membership of 545,539, from which returns were received for January, 1901.

TRADE DISPUTES

to the number of 33 began in January, 1902, involving 23,558 workpeople, of whom 6,898 were directly and 16,660 indirectly affected. The corresponding number of disputes in January, 1901, was 29, involving 17,754 workpeople. Of the 33 fresh disputes in January, 1902, 11 occurred in the mining and quarrying industries, 13 in textile trades, 4 in metal, engineering and shipbuilding trades, and 5 in other industries. Of the 33 new and old disputes of which the termination is reported, 6 were decided in favour of the workpeople; 13 in favour of the employers; and 14 resulted in a compromise. Changes in the

RATES OF WAGES

of about 156,678 workpeople were reported during January, of which number 2,783 received advances, and 153,895 sustained decreases, the net effect being a decrease averaging 5½d. weekly per head. The principal decrease was that sustained by 135,000 coal miners in South Wales. Changes affecting no less than 135,000 workpeople took effect under sliding scales.

COLONIES.

The monthly report, compiled by the EMIGRANTS' INFORMATION OFFICE, is as follows:—**Canada.**—The report of the Dominion Labour Department for January states "Employment is general, except in those branches of particular trades which are affected by the winter season, as outdoor construction works and the like; and in some parts the demand considerably exceeds the supply. The coal-mining industry on Vancouver Island (British Columbia) is, however, to be further excepted. Owing to recent fires in some of the mines, a temporary closing, and a part reduction of the working force for other reasons in others, a number of miners and their helpers have been unemployed." During 1901 the building, metal, engineering and shipbuilding trades were very busy, and the printing and many other trades were also well employed. There is a fair demand at the Rossland mines in British Columbia for miners and mine labourers, and a good demand for carpenters, painters, paper-hangers, and female servants, the latter receiving 20 dols. to 30 dols. a month, with board and lodging; a blacksmith, who can also do wheelwrights' work, can always get good wages in British Columbia. **Australasia (New South Wales).**—Reports from Yerrilderie and Hillston state that the only demand is for a few carpenters. At Orange the only demand is for female servants and a few farm labourers. At the Broken Hill silver mines work is very dull, owing to low prices, and many men are out of employment. (**Victoria.**)—The supply of labour is, for the most part, sufficient. The minimum wages for labourers in the pottery trade have been fixed at 36s. to 40s. per week of 48 hours, and for females over 18 years of age, employed in the making of general pottery, at 20s.; for compositors, letterpress machinists, and stereotypers in the printing trade, at 50s. to 52s. per week of 48 hours; for linotype or monoline work, at 63s. per week of 48 hours; for lithographers and bookbinders, at 52s. per week of 48 hours; and for general butchers, at 45s. per week of 52 hours. (**South Australia.**)—A report from South Australia states that there is a fair demand through the summer months for farm and general labourers at 15s. to 25s. a week, with board and lodging; that there is a good demand for female servants, but that there is no demand for miners, station hands or mechanics. (**Queensland.**)—A report from Brisbane states that there is practically no demand for more labour, except in the case of female servants. At Rockhampton the only demand is for female servants and a few farm or general labourers. (**Western Australia.**)—The dispute in the building trade at Perth and Fremantle has been settled; the week's work is fixed at 48 hours, and the rate of 1s. 4½d. an hour remains unaltered; piece work is abolished. (**New Zealand.**)—A report from Invercargill states that there is a good demand for farm and general labourers, shepherds and female servants, but not for mechanics, except for those competent to engage in gold dredging, which is an increasing industry. At Auckland, farm and general labourers, station hands, female servants and carpenters are wanted, but not miners. At Wellington, miners, female servants, engineers and blacksmiths are in demand. In most parts of the colony there is a demand for competent farm labourers and lads for milking.

South Africa (Cape Colony).—No one is now allowed to land in South Africa without a permit. This must be applied for at the Permit Office, 39, Victoria-street, London, S.W. The applicant must possess £100, or prove that he is in a position to maintain himself in South Africa. Applicants living within 50 miles of London must apply in person. These permits are no guarantee that the holders will be allowed to proceed inland. The Permit Office does not include persons wishing to go out to farm, without any definite farm in prospect, amongst those having knowledge of a trade or profession. From a large number of official reports, dated at the end of 1901, which have been received from all parts of the colony, it appears that there was a demand for skilled labour in King William's Town, Grahamstown, East London, Wellington, Beaufort West, Somerset West, Stellenbosch, Willowmore, Port Nolloth, Mafeking, and some other small places, and for female servants in many parts. This demand was owing to so many men having joined the irregular forces at higher wages, and to various military demands. Rates of wages and prices of provisions were rising in most districts. (**Natal.**)—There is a good demand throughout the colony for men in the building trades, such as carpenters, bricklayers, stonemasons, plasterers, painters, etc. Competent men of good character can obtain reduced third-class passages at £10. 2s. and 12 guineas a head by applying to the Agent-General for Natal, 26, Victoria-street, London, S.W. A few railway guards, platelayers, locomotive boiler makers, locomotive fitters, turners, and machine men of five years' experience are also wanted. Permits to land must be obtained from the Permit Office, 39, Victoria-street, London, S.W. The cost of living in Natal has risen considerably. (**Orange River Colony and Transvaal.**)—Only refugees, Government employes, and persons engaged in a service of a public nature will be permitted to proceed to the Transvaal. Candidates for the new South African Constabulary should apply to The Recruiting Officer, S.A.C., Recruiting Office, King's-court, Broadway, Westminster, S.W.; they must be good riders, good shots, single, strictly sober, and from 20 to 35 years of age; they will be given free passages to South Africa. Farriers also are wanted for this Force.

EMIGRATION AND IMMIGRATION.

* * *The Imperial Institute acts in concert with the Emigrants' Information Office (which is under the direction of the Colonial Office), of 31, Broadway, Westminster, S.W.; and also with the British Women's Emigration Association, now temporarily carrying on its work in rooms at the Institute. The Handbooks and Quarterly Circulars issued by the Emigrants' Information Office may be obtained at the Commercial Intelligence Office. Special information and practical advice respecting Canada and Cape Colony will also be furnished by the Curators of these Sections.*

UNITED KINGDOM.

General Emigration.—During January this year, 12,843 persons left the United Kingdom for places out of Europe—about the same number as in January, 1901. There was an increase of 10 in the number of British and Irish emigrants to South Africa, of 330 in the number to British North America, whilst fewer were bound for Australasia and the United States. The sum total of emigrants—12,843—was made up of 7,819 British and Irish, and 5,024 foreigners.

Alien Immigration.—According to the monthly return issued by the Board of Trade, the number of aliens that arrived from the Continent at ports in the United Kingdom during the month of January amounted to 6,935, as against 7,414 so returned for January, 1901. Of these 1,251 came from Germany, 1,151 from Holland, 873 from Scandinavian ports, and 788 from Dieppe. The number stated to be *en route* to America or other places out of the United Kingdom is given as 2,803, and compares with a total of 2,324 in the corresponding return of the previous year.

British Women's Emigration Association.—The hon. sec. of the British Women's Emigration Association reports the number of applications from January 21 to February 21, to be 420.

The dates of the Protected Parties to Canada for this season are now fixed, viz.: April 17, May 22, July 4, August 7, September 11, and October 16. These will sail by the ss. *Vancouver* to Quebec. A party of young ladies for situations in the North-West Territories is also sailing on March 27, in ss. *Dominion* to Portland. It is anticipated that a large number of young women will emigrate this year to Canada, as the free passages to Australia are suspended. The Association is pledged to protect its travellers throughout their journey, and this makes it imperative to provide accommodation for one night in London, for those who start from Euston at 7 a.m. Some of them often need it for several days, when they have left their situations or parted with their "homes," while waiting to sail. Those going to Africa and Australia, New Zealand and the States are also obliged to sleep in London the night before they embark, if their homes are at a distance. This necessity has made the Council of the Association decide that the time has now come to open a Hostel of its own in London, that its travellers and other respectable women may obtain safe, comfortable and economical lodgings. The initial expenses will be heavy, but the one Central British Hostel in London will serve for emigrants to all the Colonies.

The Home Country should not be behindhand in furnishing this essential, for the comfort and advantage of the women leaving their native land.

The Colonies have already established Reception Homes in their principal towns, so as to minimise the dangers and difficulties to the young women landing on their shores. The Home at Westminster used by our travellers for the last six years is now closed. Will not some of the believers in the benefits of emigration help the Association to found a good house of its own in London? Consider the advantage to a girl, a stranger in that great city, to be able to be sure of finding a safe shelter and kind welcome, on the first night of leaving her home and her friends, to travel to the other side of the world. There are always many things to be attended to that last evening, not infrequently one of the party has left behind her ticket or her keys, or there are papers to be signed, last words to be spoken or written home.

It is important that this Hostel should be opened without delay, so as to have it ready for the Canadian season, and also for the large numbers for South Africa which it is anticipated will be proceeding out there as soon as peace is established.

The hon. sec. of the British Women's Emigration Association begs for contributions towards the Hostel Fund; these may be forwarded to the Women's Emigration Office, at the IMPERIAL INSTITUTE.

The Australian 3rd class rates are now fixed at £17 the lowest price, and £19 for a berth, in a four-berth cabin. Some places have been reserved in the deck cabins of ss. *Austral* for April 11, and young women intending to go to either of the Australian ports, are advised to join a party for that date. The number of persons who travelled under the care of the Association in 1901, was 447.

The annual report of the work of the past year will be issued in April, in time for the annual meeting. The magazine *The Imperial Colonist*, is to be enlarged by the addition of four more pages, and interesting articles are promised for future numbers. The circulation appears to be satisfactorily increasing. It will be forwarded monthly to anyone who sends an order, enclosing 2s. 6d. to cover postage, for the yearly subscription, to the hon. sec. British Women's Emigration Association, IMPERIAL INSTITUTE, London.

COLONIES.

Canada.—NEW IMMIGRATION OFFICE AT WINNIPEG.—The Provincial Government has decided to establish a new immigration office in Winnipeg as a branch of the Department of Agriculture and Immigration. The object of the department in establishing this branch is to provide a place which will be easy to reach by immigrants who desire to obtain information about the province and who come over the Canadian Pacific Railway. Maps and pamphlets will be kept for purposes of distribution, together with samples of grain and other matter which will be useful to new arrivals and which will give information without making it necessary for people to go to the Government buildings in order to obtain it. In addition to this the department intends to use the branch as a means of placing immigrants who arrive in the province, seeking employment in the spring or while harvesting operations are on, and for this purpose a list of farmers requiring hands will be kept.

CUSTOMS TARIFFS.

COLONIES.

Australian Commonwealth.—BYE-LAW RESPECTING FREE IMPORTATION OF MINOR ARTICLES USED IN THE MANUFACTURE OF CERTAIN GOODS.—The *Commonwealth of Australia Gazette*, for 20th December last, contains a copy of a Customs Bye-Law to the effect that certain "minor articles" used in the manufacture of bellows, blinds, boots and shoes, fishing rods, furniture, harness, saddles, whips, hats and caps, metals and vehicles, etc., within the Commonwealth, may be imported free

of duty. The list of "minor articles" referred to in the Bye-Law is in considerable detail, and can be seen by persons interested on application to the Commercial Intelligence Branch of the Board of Trade, 50, Parliament-street, S.W., any day between the hours of 10 a.m. and 5 p.m.

BYE-LAW RESPECTING PIECE-GOODS USED IN THE MANUFACTURE OF WATERPROOF CLOTH. The copy of the above-mentioned *Gazette* further contains a Customs Bye-Law notifying that "imported piece-goods not containing silk may be delivered at a duty of 10 per cent. *ad val.*, for the purpose of being manufactured into cloth made waterproof with india-rubber, on the condition that the manufacture is carried on in a warehouse licensed under the Customs Act, 1901."

THE NEW TARIFF.—The Federal House of Representatives has confirmed the Excise duty on grape spirit of 11s., and has raised the Excise duty on barley, malt, molasses, and maize to 12s. 6d., and on other spirits to 13s. The import duty remains at 14s.

British South Africa.—DUTIES ON GOODS FOR TRANSVAAL *via* NATAL.—The *Natal Mercury* states that it has been notified that on and after 1st February, as regards goods destined for Pretoria and Johannesburg, Transvaal Customs Duties will not be collected in Natal, but will be payable at the place of destination, to the proper officers of the Transvaal Customs stationed there. Therefore, as regards Pretoria and Johannesburg (and those places only for the present), Transvaal Customs entries will not be accepted by the Natal Customs. Goods will, however, still be refused by the Railway Department unless the railway-consignment-note has been endorsed by the Natal Customs with the usual stamp and signature. In the case of goods from bonded warehouses, or, when dutiable, from ship's side, the railway-consignment-note will be stamped and signed on production of the Natal transit-entry. In the case of goods from open stocks or of Colonial goods, or of goods free from Customs Union duties, one entry only is to be passed, and, on production of this entry, containing all particulars of export, the railway-consignment-note will be stamped and signed. The usual permits to import into the Transvaal must, however, still be obtained and produced. This notice applies only to Pretoria and Johannesburg. Goods for other stations and places must be cleared in Natal as hitherto.

Transvaal.—IMPORTATION OF GOODS.—The Transvaal *Government Gazette* of 10th ult. publishes the following Proclamation by His Excellency Lord Milner, the Administrator of the Transvaal:—

Whereas it is necessary to amend Proclamation No. 2 of 1901 (see *Board of Trade Journal* for 28th March last, pp. 761-2), and to make further provision for the importation of goods into the Transvaal:

Now, therefore, by virtue of the authority in me vested, I do hereby declare, proclaim, and make known as follows:—

1. Proclamation No. 2 of 1901 shall, from and after the 1st day of February, 1902, be repealed, and from and after the said date the importation of goods into this Colony will be subject to the following conditions:—

(a) A permit for such importation shall be previously obtained from the Military Governor of Pretoria, or his duly appointed deputies.

(b) Customs duties shall be paid on all goods imported in accordance with the laws and regulations of the Customs.

These duties shall, until further provision be made therefor, be levied according to the Customs tariff leviable by the Laws of the late South African Republic, which shall be read, however, as if the following appeared therein in the schedule of articles exempted from duty:—

"Public stores, imported or taken out of bond by, and *bonâ fide* for the sole and exclusive use of the Government of His Britannic Majesty or the Government of any Colony, State or Territory in South Africa, provided that a certificate be delivered to the Customs given under the hand of a principal Imperial, Military, Naval, Civil, Commissariat or Ordnance Secretary or Officer, or under the hand of a Secretary to any Government as aforesaid, setting forth that any duty levied on such public stores would be borne directly by the Treasury of his Government; and provided further that no portion of such stores used or unused shall be sold or otherwise disposed of so as to come into the possession of or into consumption by any parties not legally entitled to import the same free of duty, until the intention so to sell or dispose of the stores shall have been notified to the principal officer of Customs in this territory, to whom the duty leviable according to the tariff then in force shall be paid by the Government selling or disposing of the stores: Wine, spirits, and beer, imported direct or taken out of bond by, and for the sole use of, Commissioned Officers serving on full pay in the regular Military or Naval forces of His Britannic Majesty, subject to such regulations as the Customs may make for the due protection of the revenue, provided that if any such liquors shall be sold or otherwise disposed of to or for consumption by any other person not legally entitled to import the same free of duty without the duty being first paid thereon to the Customs according to the tariff then in force, then they shall be forfeited, and the parties knowingly disposing of such liquors or into whose possession the same shall knowingly come shall be liable to such penalties as may be prescribed by law; and provided further that until otherwise enacted articles commonly known as 'canteen stores' imported or taken out of bond for the sole and exclusive use of His Majesty's Military Forces may, under the foregoing conditions, be admitted free of duty."

2. The Customs duties on goods imported from or through the colonies of the Cape of Good Hope or Natal, destined for places in the Transvaal other than the towns of Pretoria and Johannesburg, shall be paid to the collectors of Customs of those colonies, who have been nominated and appointed to act as agents for the collection of such duties. Goods destined for Pretoria or Johannesburg shall be duly entered and duty thereon shall be paid on arrival in accordance with the laws and regulations of the Customs.

3. The permits mentioned in section 1, sub-section (a), shall be issued subject to such conditions as may from time to time be prescribed by the said Military Governor of Pretoria.

4. Any goods imported as aforesaid without payment of the proper Customs duties or contrary to the regulations mentioned herein shall be liable to confiscation, and the importer or his agent shall in addition be liable to a fine not exceeding five times the amount of the Customs duties thereon, or, in default of payment, to imprisonment with or without hard labour for a period not exceeding twelve months.

5. This Proclamation shall be read together and with the Customs law of the Transvaal.

GOD SAVE THE KING.

INDIA.

DECISION REGARDING GENERATORS FOR MAKING SODA-WATER.—Customs circular (No. 1 of 1902) contains a Decision to the effect that generators for making soda-water, which are worked by steam power and are not adapted for working by manual or animal power, are exempt from duty under entry No. 14 of Schedule IV. of the Indian Tariff Act 8 of 1894.

FOREIGN COUNTRIES.

Chile.—ABOLITION OF IMPORT DUTIES ON PROVISIONS FOR VICTUALLING SHIPS.—According to the French *Moniteur Officiel du Commerce* of the 23rd January, the Chilean Government has abolished the import duty on provisions and eatables destined for use on ships. This applies to trading vessels, whether foreign-going or engaged in the coasting trade, as well as to Chilean and foreign men-of-war.

France.—IMPORT DUTIES ON "COLONIAL PRODUCE."—With reference to the French import duties on "colonial produce," the Board of Trade have received a copy of a despatch from H.M. Ambassador at Paris, reporting that a Bill to suspend the application from 24th ult., of the maximum tariff to British "colonial produce" has been passed by the French Chamber of Deputies, and is now before the Senate. Should this Bill become law, "colonial produce" of British Colonial origin will continue to be admitted into France at the rates of duty hitherto in force.

France (San Salvador).—COMMERCIAL CONVENTION BETWEEN THE ABOVE COUNTRIES.—The French *Journal Officiel* for the 29th January contains the text of a Commercial Convention concluded between France and San Salvador on the 9th January, 1901, and ratified at Paris on the 15th January, 1902. According to this Convention, "colonial produce" of Salvadorian origin will be admitted into France, Algeria, Tunis, and French colonies and possessions at the lowest rates of duty applicable to similar products of any other foreign origin. Reciprocally, goods of French or of French colonial origin are to be admitted into San Salvador at the lowest rates of duty applicable to similar goods of any other foreign origin, and the rates of duty on imports from France are to be lowered in respect of a number of articles specified in a schedule annexed to the Convention.

The text of the Convention, together with the lists of articles with respect to which concessions are made on either side, may be seen by those interested on application at the Commercial Intelligence Branch of the Board of Trade, 50, Parliament-street, S.W., any day between the hours of 10 a.m. and 5 p.m.

Guatemala.—IMPORT DUTIES: PROPORTION PAYABLE IN GOLD.—A memorandum prepared by H.M. Vice-Consul at Guatemala draws attention to the fact that, although the exact Tariff rates of import duty, without abatement or surtax, are now nominally leviable, the regulation which requires 30 per cent. of the duties to be paid in gold certificates is still in force. The effect of this regulation is practically equivalent to a surtax of 60 per cent. on the nominal Tariff rates, gold certificates being accepted by the Government at a premium of 200 per cent.; but the Vice-Consul adds that this rate, although maintained by the Government without modification for over two years, is subject to alteration at any time, the actual premium on gold being considerably higher than the rate mentioned.

Portugal.—TEMPORARY IMPORTATION OF ARTICLES INTENDED FOR CONSUMPTION OR REPAIR.—The Portuguese *Diário do Governo* for the 13th September last contains a Royal Decree authorising the temporary importation into Portugal, free of duty, of articles intended for consumption or repair.

Russia.—CUSTOMS DECISIONS.—The following Decisions with regard to the classification of articles under the Russian Tariff have been issued in recent circulars of the Russian Customs Department:—

Tariff classification of "lithopone."—The white paint known as "lithopone," consisting of sulphate of baryta and sulphuretted zinc, is dutiable under Section 137 of the Tariff, at the rate of 4 roubles 50 copecks per pound (£1. 9s. 7d. per cwt.), with the addition of the surtax of 10 per cent. laid down by the Imperial Ukase of the 5th August, 1900.

Articles manufactured of wood, with ornamental parts (not being essential trimmings) of leather or of textile material, are dutiable under Section 61, point 4, of the Tariff, at the rate of 15 roubles per pound (£4. 18s. 6d. per cwt.), with a surtax of 10 per cent., as mentioned in the preceding paragraph.

Machines and apparatus not specially mentioned, composed of various ordinary materials, if they contain no iron or steel, or contain either in insignificant proportions only (as bolts, joints, etc.), are dutiable according to the material of which they are made. If they are composed of various ordinary materials (other than copper and its alloys), but contain iron or steel (except in the form of bolts, etc.) in any proportion, they are dutiable at the conventional rate of 2 roubles 10 copecks per pound (13s. 9d. per cwt.).

Periodicals in the Polish language are free of duty under Section 178, point 3, of the Tariff.

Medical and pharmaceutical preparations not mentioned in the list of preparations authorised to be imported into Russia. Applications for leave to import these articles must be accompanied by two samples for examination. If imported in special packages, with labels and descriptions, the samples must also be accompanied by these labels and descriptions.

United States.—CUSTOMS DECISIONS.—The following is a list of some Decisions affecting the application of the Customs Tariff and Customs Regulations of the United States, which have recently been published by the Treasury Department at Washington:—

Hall-marked silver.—The goldsmiths' hall-mark placed on unfinished silver goods of domestic manufacture re-imported into the United States after being sent to the United Kingdom to be hall-marked, does not constitute an improvement in condition of the goods or advancement in value abroad within the meaning of para. 483 of the Tariff. Such goods may, therefore, be re-imported free of duty.

Spangled articles.—Ornaments, trimmings, and other articles, composed in part of spangles made of gelatine, are dutiable as "articles made in part of spangles," under para. 408 of the Tariff at the rate of 60 per cent. *ad val.*, and not under para. 450 as "articles made in chief value of gelatine."

Marble statuary, shown by proper certificates to be the professional production of recognised sculptors in the country of production, is dutiable as "statuary" under para. 454 of the Tariff at the rate of 20 per cent. *ad val.*, and not under para. 115 as manufactures of marble.

Scouring bricks, prepared from ground pumice stone and sand, mixed and pressed into different sizes, are dutiable as "pumice stone wholly or partially manufactured," under para. 92 of the Tariff, at the rate of \$6 per ton.

Finished articles of cotton cloth, such as couch covers and horse blankets, with whipped, hemmed, or stitched edges, made wholly of cotton, come under the definition of "cotton cloth" given in para. 310 of the Tariff, as consisting of "all woven fabrics of cotton in the piece or otherwise," and are, therefore, dutiable under the "countable clauses" of the Tariff, and not under para. 322, as "manufactures of cotton, not specially provided for."

Cotton glove material, made on the "Milanese machine," resembling knit goods in appearance, and of which the threads cannot be counted by unravelling or other practical means, is dutiable under para. 322 of the Tariff as a "manufacture of cotton, not specially provided for," at the rate of 45 per cent. *ad val.*

TRANSPORT AND FREIGHTS.

The Freight Market.—Outward rates are weaker, with the exception of Mediterranean Ports, which, owing to a combination of circumstances, have improved 3d. to 6d. Last Welsh fixtures have been on basis of 5s. 9d., Genoa; 4s. 6d., Malta; 6s. 6d., Adriatic; 5s. 9d., Constantinople; 5s. 6d., Port Said; 9s. 6d., Monte Video; 9s. 3d., Colombo; 15s. 6d., Mauritius; 16s. 6d., South Africa. **American** markets continue weak in all directions. **Australia** quiet. Recent fixtures have been on basis of 60s. hay to South Africa; 6s. to 6s. 6d. time charter foreign trades; 7s., Colonial register. Newcastle paid 9s. Singapore. **Black Sea** dull. Odessa rate has fallen to 8s. berth, 9s. 6d. charter. **Eastern** markets have been well maintained all round, and Rangoon has improved 2s. 6d., last fixtures having been on basis of 23s. 9d. **Mediterranean** markets continue in a state of stagnation. **River Plate** weaker. San Lorenzo down to 16s. 6d.—WEDDEL, TURNER & CO., London, 25th February, 1902.

UNITED KINGDOM.

Dover.—The new Prince of Wales Pier at Dover, which has cost over half-a-million sterling, was completed last month after having been nine years in construction. The pier forms the new commercial harbour, which encloses an area of seventy-five acres.

COLONIES.

Bermuda.—NEW FLOATING DOCK.—On the 8th February last, C. S. Swan & Hunter, Limited, of Wallsend-on-Tyne, launched a large floating-dock, which has been built to the order of the Lords Commissioners of the Admiralty, to be placed in the Government Dockyard at Bermuda, where it will replace the old floating-dock that has been there since 1869, and which has now become obsolete. The present dock is 545 feet long, and, having no gates, the length of ship it can take is not restricted; its clear width of entrance between rubbing fenders is 100 feet. Its lifting power up to the pontoon deck level is 15,500 tons, but by utilizing the shallow pound this can be increased to 17,500 tons, and the walls are of sufficient height to allow of a vessel drawing 32 feet to be taken on 3 ft. 6 ins. keel-blocks. The present dock is of the type known as a floating graving-dock, the invention of Messrs. Clark & Standfield, from whose plans it was built. The dock will have to lift the line-of-battle ships of 15,000 tons displacement with a length of bearing keel of 343 feet, but in addition it has to deal with cruisers of the *Terrible* class of about the same displacement, but with 383 feet of bearing keel, and lastly auxiliary cruisers like the *Campania*, weighing some 17,000 tons, with a bearing length of keel of 502 feet.

Canada.—STEAMSHIP LINE TO SOUTH AFRICA.—A *Reuter* telegram, dated Ottawa, February 13, states that the Dominion Parliament was opened on that day by Lord Minto, Governor-General. In his speech from the throne His Excellency said: I have pleasure in informing you that the Governments of Australia and New Zealand have accepted the invitation of my Government to attend the conference in London in June for the consideration of trade, transportation, cable, and other matters of intercolonial concern, and it is hoped that the meeting will lead to the extension of Canadian trade with those important portions of His Majesty's dominions. I have further to advise you that the Government, having caused an enquiry to be made, has reached the conclusion that the establishment of a direct steamship line with South Africa will enable Canada to secure in that country a profitable market for her varied products, and that it will endeavour to arrange such a service.—During next season the Canadian Forwarding and Export Company intends to run a regular fortnightly service of steamers between Rotterdam and Montreal, to commence in the middle of April.

FOREIGN COUNTRIES.

Brazil.—RIO JANEIRO HARBOUR IMPROVEMENTS.—The Brazilian Government issued a decree on the 6th November sanctioning the formation of the "Companhia Docas do Rio de Janeiro," and some particulars on the subject are furnished to the *Hamburgische Börsenhalle* by its correspondent at Sao Paulo. This Company, it appears, has been created by the fusion of two companies each of which had obtained the privilege of constructing and working quays in the harbour of Rio de Janeiro, namely, the Empresa Industrial de Melhoramentos do Brazil, and the Rio de Janeiro Harbour and Docks Company. Hitherto these two companies have been bitterly antagonistic, to the prejudice of the work they were supposed to forward, and the fusion now effected is expected to result in a great impetus to the carrying out of the quay improvements as planned. It is estimated that a capital amounting to 150,000 contos of reis will be required for executing the works, the undertaking being therefore a gigantic one. The privileges granted to the new concern are somewhat greater than those accorded to the Santos Quays Company. The tariff at Santos will be taken as the basis of that of the Rio Quays Company as regards the dues to be levied for the mooring, discharging, and loading of vessels, and the storing of merchandise in the warehouses, but in addition to these charges the privilege of levying a tax not exceeding 2 per cent. of the value of goods imported into Rio for the period of forty years, dating from the 1st January, 1902, is granted to the Rio Company, as an equivalent of 6 per cent. interest on the capital invested, and for maintenance and general expenses. A sinking fund has also to be provided on the basis of a redemption within the period of sixty-nine years. The hope is indulged in that the projected new quays may be completed within ten years from the present time, and then it is estimated that the profits realised will render it possible to pay interest at the rate of 8 per cent. on the capital of the Company. Besides the ordinary income from shipping operations, large profits are expected to be made from the sale of valuable building plots, formed by the draining and filling in of ground contiguous to the quays. It is quite possible, in the present condition of Brazilian finance, that some of the capital may be sought for on this side of the Atlantic.—*Fairplay*.

Madagascar.—TUGS AT TAMATAVE.—The Consul-General for France is informed by the French Ministry of Commerce, that the Société du Wharf de Tamatave, Madagascar, has now, for the service of that port, two tugs—the *Alsace* of 100 horse-power, and *Lorraine* of 50 horse-power. In signalling for a tug the pilot flag should be hoisted under the national one. The above information is of the highest interest, as it appears that a recent wreck might have been avoided if the captain had been acquainted with the signal.

New York and the Levant.—The new direct steamship line between New York and the Levant, established jointly by the Hamburg-American Company and the German Levant Line, is already in operation. The first boat (the Levant steamer *Seriphos*) left New York with a full cargo on the 7th ult., and the next to follow will be the Hamburg-American Line boat *Sicilia*. The ports to be included in this direct homeward service are Malta, Alexandria, the Piræus, Smyrna, Constantinople, Novorossisk, and Odessa. The first voyage from the Levant to America is announced for the 20th March, starting from Odessa, and the boat will call at Constantinople, the Piræus, Patras, Malta, and Algiers—Beyrout and Alexandria will be included later on.

Russia.—A NEW RAILWAY FROM ST. PETERSBURG TO ODESSA.—The Odessa correspondent of the *Times* writes under date February 4:—The question of establishing a new line of railway joining St. Petersburg and Odessa and coinciding as nearly as practicable with the 30th parallel of longitude E. has occupied the attention of the Russian Minister of Ways and Communications, Prince Khilkoff, for many years past. According to the latest advices, there seems good ground for concluding that the decision of the Russian authorities will shortly be given in favour of the construction of this railway, which will be known as the St. Petersburg-Kieff-Odessa Southern Trunk Line. The new line will not only effect a very considerable saving in the journey between the northern and southern capitals of the empire, but will open up many vast and wealthy grain and mineral areas at present either served inefficiently by the existing railways or not served at all. Both from the commercial and the strategical point of view such a trunk line of *minimum* length will possess advantages for Russia difficult to over-estimate.

OFFICIAL AND COMMERCIAL CONTRACTS. UNITED KINGDOM.

Bournemouth.—TENDERS are invited, until the 8th inst., for TRACTION and ARC LIGHTING SWITCHBOARDS. Particulars (£3. 3s.) may be obtained from F. W. Lacey, borough engineer, Municipal Offices, Bournemouth.

Colchester.—TENDERS are invited, until the 6th inst., for the SUPPLY and DELIVERY for twelve months of York curbing, granite cubes, broken granite, broken Kentish ragstone, Kentish sifted red flints, Portland cement, glazed stoneware sewer pipes, from 24 in. to 4 in., with junctions, bends, traps, taper pipes, and gullies. Particulars may be obtained from Herbert Goodyear, borough engineer and surveyor, Colchester.—TENDERS are also invited until the 6th inst., for the SUPPLY of about 450 tons of the best hand-picked Buxton or Derbyshire stone LIME, to be delivered at the rate of about 9 tons per week. Particulars as above.

Ilkeston.—TENDERS are invited, until the 27th inst., for the CONSTRUCTION of a PUMPING STATION. Particulars (£10. 10s.) may be obtained from Messrs. G. and F. W. Hodson, Loughborough.

London.—The London County Council invite TENDERS, until the 11th inst., for the SUPPLY, DELIVERY, and ERECTION of a 10-ton OVERHEAD TRAVELLER. Particulars (£1) may be obtained from the Engineer's Department, County-hall, Spring-gardens, S.W.

Oban.—TENDERS are invited, until the 7th inst., for the SUPPLY and ERECTION of (4) steam, exhaust, drain, and other pipes, pumps, condensing plant, etc.; (5) balancing transformers and motor generators; (6) storage batteries; (7) switchboard; (8) are lamps, incandescent lamps and fittings; (9) cable work; (11) travelling crane. Particulars (£2) may be obtained from Burstall and Monkhouse, 14, Old Queen street, Westminster.

Swansea.—TENDERS are invited, until the 8th inst., for the SUPPLY, DELIVERY, and ERECTION of two 600-k.w. continuous-current STEAM DYNAMOS, together with condensing plant, steam and exhaust pipes, and valves. Particulars (£3. 3s.) may be obtained from Mr. C. A. L. Prusmann, Electricity Works, Swansea.

Tynemouth.—TENDERS are invited, until the 18th inst., for the CONSTRUCTION of a GRAVITATION MAIN, consisting of 12½ miles of 18-in. cast-iron pipes from Stanington to Tynemouth. Particulars (£5) may be obtained from Mr. James Mansergh, 5, Victoria-street, Westminster.

COLONIES.

New South Wales.—The Government of New South Wales are prepared to grant a concession of a 99 years' lease of a suitable floating-dock site at the port of Newcastle, N.S.W., to any responsible owner or company undertaking to build, equip, and maintain a floating-dock suitable for accommodating vessels up to 5,000 gross tonnage. Tenders to be addressed to the Under-Secretary for Public Works, Sydney, and to be delivered in Sydney up to the 7th April, 1902. Particulars may be obtained at the office of the Agent-General for New South Wales, 9, Victoria-street, Westminster, London, S.W.

Queensland.—The Municipality of Rockhampton invite TENDERS, until the 31st inst., for the CONSTRUCTION of an ELECTRIC TRAMWAY SYSTEM complete. Particulars may be obtained from Mr. H. E. Bellamy, the city engineer.

South Australia.—TENDERS will be received at the Supply and Tender Board Office, Adelaide, up till the 16th April, for the SUPPLY of the following MATERIALS, delivered in bond, on wharf, Port Adelaide, wharfage to be paid by the contractor:—

- 12 mild steel boiler plates.
- 17 mild steel smokebox tube plates for flanging (five drawings, 1s. each).
- 4 mild steel firebox back casing plates for flanging (two drawings, 1s. each).
- 8 mild steel firebox throat plates for flanging.
- 17 copper tube plates for flanging (four drawings, 1s. each).
- 4 copper wrapping plates.
- 329 engine and tender tyres (ten drawings, 1s. each).
- 500 carriage and wagon tyres (one drawing, 1s.).
- 24 metal water-closet pans (one drawing, 1s. 6d.).
- 24 metal folding lavatories (one drawing, 2s.).
- 2 No. 6 Stow flexible shafts.
- 1,000 indiarubber draw springs (one drawing, 1s.).
- 50 indiarubber hose pipes (one drawing, 1s.).
- 12 bars channel steel (one drawing, 1s.).
- 20 bars Yorkshire angle iron (two drawings, 1s. each).
- 156 firebricks for gas furnaces.
- 760 bronze flexible unscrewed firebox stays.
- 32 bars of stay bolt metal.
- 500 indiarubber washers for hose pipe couplings.
- 750 compound indiarubber washers.
- 1 ton "Damascus" metal.
- 4 cone bearing inspectors or journal jacks.
- 2 circular best Yorkshire iron plates.
- 4 ball-bearing ear jacks.
- 200 plain indiarubber washers.
- 2 best steel crank axles (one drawing, 5s.).

Particulars may be obtained at the above office, and the office of the chief mechanical engineer, Islington, Adelaide, and also at the office of the Agent-General for South Australia, in London, 1, Crosby-square, E.C.

INDIA.

Bombay, Baroda and Central India Railway.—TENDERS are invited, until the 5th inst., for the SUPPLY of the following STORES:—(a) Fish bolts, spikes, spring steel, rails; (c) crossings. Particulars (a, 21s. each; c, 5s. each) may be obtained at the offices, Gloucester-house, Bishopsgate-street-without, E.C.

Calcutta.—The Commissioners of the Corporation Water-works invite Tenders, until the 23rd April, for 10,000 STOPCOCKS, as follows:—1,428 inch, 2,856 three-quarter inch, 5,716 half-inch; delivered c.f.i. Calcutta. The stopcocks are to be a strong pattern, gun-metal, with loose valve, square head on spindle, and a false spindle not less than ½ in. square on all sides. Stops to have male ends screwed for iron pipe. Tenders to be addressed to the vice-chairman, at the Municipal Office, Calcutta.

FOREIGN COUNTRIES.

Argentine Republic.—TENDERS will shortly be called for by the Argentine Government for the EXTENSION of the Buenos Ayres DOCKS. Particulars respecting the conditions of tender may be seen at the Commercial Department of the Foreign Office.

Belgium.—TENDERS are invited, until the 26th inst., by the National Company of Local Railways, at No. 14, Rue de la Science, Brussels, for the CONSTRUCTION of the SECTION of the LINE from Moustier to Bouvignies on the RAILWAY from Tournai to Ath. The upset price of the work is 190,894.96 francs (£7,635. 16s.), and a deposit of 19,000 francs (£760) is required. Particulars (10d.) may be obtained at the company's offices, and at the office of M. Dolmans, No. 104, Avenue de Maire, Tournai.

China (Shanghai).—The ratepayers of the international settlements at Shanghai have voted in favour of establishing a SYSTEM of TRAMWAYS in that city, and the Council has invited TENDERS, until the 7th inst., for the CONSTRUCTION and OPERATION of such a system.

Cuba.—TENDERS are invited by the United States Government for the CONSTRUCTION of a PIER, FREIGHT HOUSE, ETC., at Matanzas, to cost about \$200,000. Particulars may be obtained of the United States engineer at Matanzas. Contract closes March 8.

Egypt.—The Administration of the Egyptian State Railways invites TENDERS up to the 16th inst. for the SUPPLY of 360,000 PINE SLEEPERS, in lots of 20,000 each. Particulars (2s.) may be obtained from Lieut.-Colonel J. H. Western, R.E., C.M.G., Broadway-chambers, Westminster.—TENDERS are also invited by the Egyptian State Railways Department, up to the 16th inst., for the SUPPLY of CARRIAGE TRIMMINGS. Particulars (2s.) may be obtained at the offices of the inspecting engineer, Lieut.-Colonel J. H. Western, R.E., C.M.G., Broadway-chambers, Westminster, S.W.

Russia.—Prizes of 5,000 roubles, 3,000 roubles, and 1,000 roubles are offered for the best AUTOMATIC COUPLING APPARATUS for railway cars. Foreigners, as well as Russians, may take part in the competition. The final date for the presentation of plans is fixed for the 15th April, 1903. They should be addressed to the Congress of the Representatives of Russian Railways, St. Petersburg, Nevsky 30.

Siam.—TENDERS are invited by the Siamese Government, to be received not later than April 1, for the supply of ROLLING STOCK for the Siamese State Railways. Particulars at the Commercial Department, Foreign Office.

Spain.—The Port Works Committee at Barcelona invite TENDERS, until the 10th inst., for the SUPPLY of a STEAM TUG. A provisional deposit of 2,000 pesetas (£77) is required to qualify any tender.—The Ministry of Marine, Madrid, require a SUPPLY of GUNPOWDER and MAUSER CARTRIDGES for the fleet for two years. No date for closing contract is stated.—TENDERS are invited, until the 7th inst., for the INSTALLATION and WORKING for 15 years of ELECTRIC LIGHT in the "Careel Modelo," Madrid, no result having apparently followed the previous call. The upset price is 40,000 pesetas (about £1,173) per annum, payable in monthly instalments. A deposit of 2,000 pesetas (£59) is required to qualify any tender. Particulars are given in the *Gaceta de Madrid*.—TENDERS are invited, until the 15th inst., for the SUPPLY of COAL and IRON to the committee of the "Maestranza de Artillería" of Sevilla during the fiscal year 1902, as follows:—1,500 metric quintals of foundry coal at the upset price of 4.95 pesetas per metric quintal, 3,000 metric quintals of machine coal at the upset price of 5 pesetas per metric quintal, 9,000 kilogs. of angle-iron, T's, double T's, rails, etc., at the upset price of 50 cents per kilog., 3,500 kilogs. of iron plates at 60 cents per kilog., and 60,000 kilogs. of bolt, bar, and plate-iron at 45 cents per kilog. Particulars may be seen at the Maestranza.—TENDERS are invited, until the 14th inst., for the SUPPLY of PLUMBAGO CRUCIBLES to the Spanish Mint during the years 1902, 1903 and 1904. The sizes and quantities (expected) required are as follows:—4,000 crucibles No. 60, 3,600 crucibles No. 50, 600 crucibles No. 35, 2,100 lids No. 60, 1,800 lids No. 50, 300 lids No. 35. Particulars may be obtained in the office of the *Fabrica Nacional de la Moneda y Timbre*, Madrid.

COMMERCIAL LAW INTELLIGENCE.

Shipowners' Lien for Freight.—In the King's Bench Division on the 10th ult., Messrs. TAGART, BEATON AND CO. sued Messrs. FISHER, of Barrow, for £1,000. Plaintiffs were agents for the sale of timber shipped by Messrs. Baars, Dunwoody and Co., who, on the 29th May last, sent plaintiffs bills of lading for a quantity of timber valued at £3,867, shipped in the *Askehall* (s.), the freight being payable by the consignees. The bills of lading stated that £3,750 had been advanced against the freight at the port of shipment, so that the value of the goods with the paid freight amounted to £7,617. Against this sum Messrs. Baars had drawn on plaintiffs for £6,000, plaintiffs to sell the goods in the ordinary way. At the same time a freight note for £1,000 signed by the captain and dated 27th May was also sent, which stated "Five days after arrival at port of destination of the *Askehall*, of which I am master, I promise to pay to the order of myself £1,000 value received for account of freight on cargo now on board my said vessel, payable under terms of charter dated 15th May, 1901. And for the payment of this note I pledge my said freight, and the consignees of my cargo and my agents are hereby directed to pay the amount of this obligation from the first amounts due for freight." This note was endorsed "pay Tagart, Beaton & Co., or order." On the 9th July, plaintiffs sold the timber and the vessel was ordered to Barrow. The duty of superintending the delivery of the cargo, and collecting as much freight as remained payable in England, was placed in defendants' hands. They knew that they had to collect £1,635, of which £1,000 was to be used in redeeming the captain's note, and the balance was to be accounted for to Messrs. Baars's agent. On the 15th July, plaintiffs gave defendants notice that they were the holders of the note, which notice was acknowledged by defendants on the 16th July. On the 19th July the *Askehall* arrived at Barrow, and the discharge began on the 20th. On the 26th July the note was presented, but defendants not having collected any freight refused payment. On the 3rd August, defendants had ample funds in hand to pay the note, but in the meantime (on the 1st August), the owners of the vessel, the West Hartlepool Steam Navigation Company, had telegraphed defendants not to pay

either captain or time-charterers' drafts out of freight, but to hold same for their account and at their risk. It appeared that the owners had chartered the vessel to Messrs. Baars for three years, by a charter-party dated 6th October, 1900, and a month's hire in advance was due on 2nd August at noon. On the 1st August a formal notice of the alleged lien for chartered hire was served on defendant on behalf of the owners. The question to be decided was whether defendants, who have sufficient funds in hand to meet the note, are bound to pay plaintiffs. His Lordship (Mr. Justice Bigham), in giving judgment, said that he did not think that under the circumstances defendants could deny plaintiffs' title. They received the money under an authority from Messrs. Baars' agent, and with his consent they undertook with plaintiffs that if plaintiffs would forward the note to them for payment they would meet it out of the money to be collected. It appeared to him that having entered into a binding promise to pay, they ought to pay, notwithstanding the shipowners' intervention. When the owners intervened, defendants had, he said, become trustees for plaintiffs of so much of the £1,000 already paid by the consignees as would be left in their hands after payment of their own charges, and they were bound to hold any further freight they might subsequently receive subject to the same trust. Although the captain said in the note that he had received £1,000 on account of freight, he had received nothing, and when plaintiffs received the note they only got the time-charterers' right to receive the £1,000, a right which was subject to the shipowners' lien. But before the lien could be exercised (there being then no chartered freight payable) £1,000 of the bill of lading freight had been paid to defendants, who, for the purpose of the receipt of the money, stood in the position of the time-charterers themselves, and no lien could afterwards be exercised on that sum. And as to the balance which was paid on 3rd August, this also, he held, reached the constructive possession of the time-charterers before any lien was exercised, for a notice of the existence of the lien served on defendants was of no value; it ought, in order to become operative, to have been served on the persons who had to pay the freight, not on those who were receiving it for the charterers. He gave judgment for plaintiffs for £1,000, less any moneys which might be due to defendants for disbursements. Leave to appeal was granted.

Stockbrokers' Liability.—*OLIVER v. BANK OF ENGLAND* (STARKEY, LEVISON, AND COOKE, third parties) was an appeal against an order made by Mr. Justice Kekewich, under which Mr. W. J. Starkey, a member of a firm of stockbrokers, was made liable to indemnify the Bank of England against loss through the sale of certain Consols. Sir Robert Reid, K.C., who appeared for the appellant, said that Mr. Edgar Oliver took an action against the Bank of England to recover the value of certain Consols and Bank stock, which had been sold under a power of attorney to which the plaintiff's signature had been forged, obtaining judgment against the bank. Mr. Edgar Oliver was a co-trustee with his brother, Mr. Frederick Oliver, since deceased. The latter had admittedly forged Mr. Edgar Oliver's signature to the power of attorney under which the appellants had acted. The bank counterclaimed against Messrs. Starkey, Leveson, and Cooke, and obtained judgment. This was the first time that a stockbroker had been made liable under such circumstances. Counsel contended that the bank authorities, who had the signatures of the trustees, had not made sufficient enquiries before transferring the shares to the appellants under the power of attorney. Lord Justice Vaughan-Williams: In certain cases third parties are not liable. For instance, if you go to Victoria Station and, seeing a gentleman standing by a train, ask him if it goes to Brighton and he says yes, but it does not, you cannot take an action against him. Again, if you ask a policeman wearing the company's uniform the question and he says yes, and you go wrong, you cannot take an action against the company, because he is not authorised to give such information, but you could take an action against the policeman for misleading you. (Laughter.) Sir Robert Reid assumed that it would be the duty of the man, not only to the passenger but also to the company, to tell the truth and say which was the correct train. In this case the bank made its own enquiries. The authorities had the signatures and probably had signed dividend warrants. Both the appellants and the bank had been misled. The bank, he submitted, had every opportunity for making enquiries, while Mr. Starkey had no such opportunity. Lord Justice Vaughan-Williams, without calling upon Mr. Green, K.C., for the respondents, said that the brokers, upon presenting the power of attorney at the Bank of England, demanded that the authorities should effect the transfer of the Consols and Bank stock in question. And the Bank of England did so. The sole question to be decided was whether or not, as the law stood at the present moment, there was raised by implication of law a warranty by the brokers upon the authority on which they demanded the bank should act. The brokers purported to act as agents of both the gentlemen, Mr. Edgar and Mr. Frederick Oliver. His Lordship was of opinion that the law did raise an implied warranty as against the brokers. The arguments of Sir Robert Reid and Mr. Upjohn were most interesting, but his Lordship thought that the learned counsel invited the Court to deal with questions which were not raised in this case. Indeed, most ingenious propositions had been put before the Court. He thought that the judgment of Mr. Justice Kekewich must be affirmed. Lords Justices Stirling and Cozens-Hardy concurred, and the appeal was dismissed, with costs.

BRITISH CONSULAR REPORTS.

Brazil (Sergipe).—The State of Sergipe is separated from the Northern portion of Bahia by the River Real, and has an area of 26,000 square miles; the chief port is Aracaju. In the Consular report, recently received, on the condition of Sergipe for the year 1900, it is stated that the imports amounted to 4,062,992 milreis (£203,150), in addition to those goods which entered the State overland, and which are valued at £150,000. Dried meat, flour, petroleum, cement, coal, wine, hardware, machinery, cotton goods, and boards were the chief articles imported. Aracaju, the capital of the State, contains 20,000 inhabitants, and a few fair shops. Near the town there is a cotton mill with 5,100 spindles and 156 looms; 400 hands are employed, spinners being paid 9d. and weavers 1s. 6d. per day. No night work is done, but the working days average 300 in the year, and 300 pieces of white calico (of 30 metres each) are turned out daily; the hands work ten hours daily. Every piece of this machinery, mill fittings, looms and spindles, came from Lancashire, the dyed yarns from Manchester, and the steam coal from Cardiff. The owners of the mill and the manager are Brazilians, and they assured me that they could not wish for better goods than we supplied them with, and appeared highly satisfied with British work. A smaller cotton mill is running near the town, and employs water power. There are 3,000 spindles and 150 looms, and the working days average 200 yearly. The machinery, spindles, etc., all came from America, Germany and France. An inspection of the shops in three of the chief towns of Sergipe gave the following results:—Germany supplies zinc sheets, metal pans and pots, cheap chains for hammocks, door locks, and cheap cutlery. The United States supply petroleum, most of the galvanised barbed wire, hoes

and hatchets, and a few cheap tools. The United Kingdom sells coals, steel tools (with the exception of files), screws, barbed wire, cutlasses, cutlery, iron roofing, hoe heads, knives, strong kettles, bar steel, shoe tacks, blacking, ink, and ready-made paint in tins. It was further noticed that cotton goods were almost exclusively from Manchester (when not of native make), but "zephyrs" came from France, and shawls from Germany and Austria, whence also comes the writing paper. In general, we may be said to secure a fair portion of the trade, but the Americans are ousting us from the market in barbed wire, and the Germans own all the trade in shawls, two very important articles. The Consul recommends those British houses who deal with either Bahia or Pernambuco to instruct their agents to watch this market closely. Sugar and cotton prices will some day rise, and then, with more money, there will be better trade, and, unless we wake up, we shall find ourselves left behind. The only commercial travellers who visit Sergipe are Brazilians travelling for German or native firms. A few smart British travellers, who know Portuguese, are wanted, with orders to visit the capital and push British goods. A market lost is hard to regain, and our German and American competitors are, the Consul considers, more energetic than we are. There is not a single bank in the Capital, and reliable information respecting credits is not easily obtainable. The German sugar houses in Maroim keep their friends in Pernambuco and Bahia well posted, whereas we can only learn what these gentlemen care to tell us. The Consul suggests that one of the British banks in either of the above-named towns should appoint an agent in Aracaju, to whom British merchants could apply for necessary information.

Somali Coast.—In his report on the trade of the Somali Coast Protectorate for the year ending March 31, 1901, the Acting Consul-General says that it is as unpleasant as it is rare to have to record a decrease in the value of the trade of this district amounting to over 11 lacs of rupees (or £78,500 odd), or something like 13½ per cent. on the average of the last three years. This sudden check in the steady advance of trade must be attributed to two causes, both of which may fortunately be considered only of a temporary nature, and which may be reasonably expected to re-act favourably on the trade of future years. The presence of the rebel Mullah in the Ogaden country rendered it necessary, for political reasons, to suspend all trade between our ports and that country. Thus, for the greater part of the year one of our most valuable markets has been closed to our traders. There are good grounds for supposing that for this reason and the absence of other outlets there are considerable accumulations of trade commodities in that country, and that on the final suppression of the Mullah and the restoration of order these products will find their way rapidly into our ports, there to be exchanged for rice, dates, cloth and other necessities, the want of which must soon be seriously felt. Again, the abundance of rain and good grazing which this district has enjoyed last season, though adversely affecting trade for the time being, must inevitably tell favourably in the long run. The Somalis being enabled to live on their live-stock and its produce, are for the time independent of rice and other provisions. But at the same time their stock is increasing, and the surplus which they find themselves unable to maintain in dry seasons, when grazing is scarce, must sooner or later be exchanged for imported provisions and other necessities. It may not, therefore, be unreasonable to predict a return to normal figures next year. It has again to be recorded that the bulk of the trade of this district is in the hands of American firms having their business centres in Aden. They practically monopolise the whole of the skin trade and import the greater portion of the cotton piece-goods. A few British firms have furnished samples of their manufactures, but these do not compare favourably either in price or quality with the popular American grey shirting, which is still without a rival.

Uruguay (Montevideo).—CRISIS IN THE JERKED BEEF TRADE.—A Foreign Office report from H.M. Minister-Resident and Consul-General at Montevideo states that at the present moment the "saladeros," or dry salting establishments in Uruguay are passing through a somewhat critical period. Their chief product is jerked beef (tasajo or charque) which finds its principal market in Brazil. Of late the existence of large stocks of this article in the latter country has sent down prices to such an extent that there is but a small margin of profit for the manufacturers, and now the trade finds itself threatened with another danger in the shape of an increase in the Brazilian import duty. "Tasajo" has hitherto paid 25 reis per kilogram, but the Brazilian Customs authorities have now decided to treat it as "preserved meat," thus raising the duty to 100 reis per kilogram. The proposed increase has apparently not yet received the sanction of the Legislature, but it is believed in Montevideo that it will be passed, and the news has created a considerable amount of alarm not only among drysalters but also among stock raisers. The present crisis should be a lesson to the "saladero" owners, and should teach them not to depend exclusively upon the production of an article like "tasajo." In Europe it could never find a market, as not the poorest peasant would subsist on it. Uruguay is rich in cattle, and it seems strange that the greater portion of the meat should be used for a primitive article which can only be disposed of in certain markets. What science can do is shown by the results of Liebig's establishment at Fray-Bentos, and it should encourage the "saladero" owners to adopt improved processes and to endeavour to produce something suitable to the tastes of civilised communities.

FOREIGN CONSULAR REPORTS.

Milk Flour.—The United States Consul at Gothenburg reports a discovery by Dr. M. Ekenberg which will be of importance in dairy farming. He claims to have invented an apparatus by which milk can be brought into the form of powder, like flour in appearance, but possessing all the qualities of milk in concentrated form, moisture excepted. It is said that this milk flour is completely soluble in water, and can be used for all purposes for which common milk is employed. The milk flour does not get sour, does not ferment, and in the dry state is not sensitive to changes in the weather. It can be kept and transported in tin cans, barrels, bags, etc. The cost of production Dr. Ekenberg has estimated at about 27 cents per 100 quarts, and he thinks that flour made from skimmed milk can be sold for about 13 cents per pound. At a recent meeting of the Academy of Agriculture, Dr. Ekenberg exhibited samples of the milk flour, which received favourable comments. It is considered that the invention will be of the greatest importance for the utilization of skimmed milk, which heretofore has largely been wasted, but in the dry form can be transported all over the country without losing any of its original good qualities. The product mentioned is considered superior to the casein products "proton" and "proteide" now manufactured from milk by the aid of rennet, acid, or lye.

Openings for Capital in Australia.—The United States Consul at Newcastle, New South Wales, in noting the prohibitory nature of the new federated tariff, prophesies a decrease of importations, and sees in consequence an excellent opening

for capital. The Consul goes into details regarding the lines of goods which may be manufactured in the Newcastle district. Although he takes much for granted his remarks are nevertheless of interest. He states that glassware and crockery may be manufactured cheaply, while iron and steel are abundant, and the great deposits of ore are close to the coalfields. Materials for soap and candles are at hand, match factories would find a ready sale for their products, all classes of woollen goods could be produced at low rates, and it would pay to make gloves and hats along American lines. There is a large sale for washing machines, clothes wringers, and various laundry apparatus. A few agricultural implements are manufactured, but there is a good demand for American mowing machines, reapers, and binders. A factory making these machines would do well. There is no nail factory here, hence large quantities are imported from other countries. A rolling mill equipped to manufacture iron articles, from railroad iron or steel and bridge beams to kettles, would control the trade of this country, as well as that of the South Sea Islands. Materials for the manufacture of all kinds of paints are easily procured at a very small cost. Magnificent woods, susceptible of a high degree of polish, are plentiful. With a heavy tariff on paper, a modern mill would do well. Much paper is used, especially the cheaper sorts, such as wrapping and news paper. Such a thing as a modern paper bag, with corners folded, he has never seen in these colonies.

Rubber Output of the Amazon Valley.—The United States Consul at Para reports that at the close of 1901, the receipts of rubber at Para were nearly 30 per cent. greater than ever before at that season. Business was good in 1900, exchange low, and credits easy. The labourers and middlemen indulged in many luxuries. The end of the season found the crisis at hand, exchange rising rapidly, the gatherers deeply in debt, and the price of rubber reduced 20 per cent. Now they are making a desperate effort to pay off this indebtedness and make a fresh start. They are getting a large proportion of their food from the streams and forests by hunting and fishing; they are purchasing only absolute necessities; and are working overtime to increase the crop and liquidate their bills. It was reported in December that there were on the way down the river, from the upper tributaries of the Amazon, about 700 tons more rubber than had ever before been shipped from that section in one season, and that there were at least 200 tons more to follow. About 30 small steamers and launches left Para and Manaus for the Acre, Jurua, Purus, and Beni rivers, and were due to return to Para in February. Altogether, adds the Consul, there is reason to believe that this season's rubber crop will exceed that of last year by a very considerable margin.

Trade Prospects in Western Canada.—The United States Consul reports that London, Ontario, is developing a considerable trade with the North-West Territories, British Columbia, and the Yukon country. These are new and promising fields, and, since this city is easily reached, it might be well for manufacturers and dealers to gain access to these new markets. Fire- and paving-bricks of good quality are not manufactured in the Dominion, owing to a lack of suitable clay. A profitable trade might be established in this line, since it is a matter of daily consideration on the part of the cities and towns of this province how to replace the old cedar block pavement, which has proved so unsatisfactory.

CHAMBERS OF COMMERCE REPORTS.

UNITED KINGDOM.

Association of the Chambers of Commerce of the United Kingdom.—The official programme of the forty-second annual meeting of the Association of the Chambers of Commerce of the United Kingdom, to be held at the Whitehall Rooms, Hotel Metropole, on March 4, 5, and 6, under the chairmanship of Lord AVEBURY (the President), has been issued. The subjects that will be discussed include every topic of interest to the commercial world, and representatives will be present from Chambers of Commerce in every district of Great Britain and Ireland. On behalf of the London Chamber, a resolution will be submitted, to the effect that His Majesty's Government be urged, in the interests of commerce, that, before recognising transference of territory by any power, they should insist on the policy of the "open door," and should invite the co-operation of other States who are similarly interested with this country in maintaining existing rights. Recognising the importance of a trade route to China, the Liverpool Chamber will urge the adoption of the following resolution: "That this Chamber is of opinion that the Mandalay-Kunlon railway should be extended without delay to the frontiers of China, and that the project for the construction of a line or lines in connection therewith to Yunan and Szechuan should receive the diplomatic and financial support of His Majesty's Government and the Government of India; or, if any other way of approach by rail to the Chinese Provinces named be preferred by the British and Indian Governments, this Association would ask that a similar measure of support should be given to the contractors of any suitable railway by such route." The Halifax Chamber will suggest the appointment of a Royal Commission to consider the possibility of increasing and strengthening the trade relations between the different portions of the Empire. The Paris Chamber of Commerce will be represented, and will submit the following resolution in favour of the compulsory use of the metric system of weights and measures: "That, in the interests of British trade, the compulsory use of the metric system of weights and measures has become imperative." No fewer than three Chambers—Leeds, Edinburgh and Sunderland—have placed down resolutions on the subject of Parliamentary procedure, they desiring some reform which will facilitate the despatch of public business, and thus permit of legislation in the interests of commerce. Quite a number of postal and telegraphic matters are to be dealt with, the suggestions being made that telegrams should be cheapened; that underground wires should be adopted, so as to prevent the interruption and disorganisation of telegraphic communication; and that additional and improved cables should be established between the United Kingdom and the Continent.

Bradford.—At the monthly meeting held on December 29 Mr. Gustav Hoffmann was re-elected as president, and in his address he said that he should like to begin his second year of office with the emphatic assurance that the work of the Law Amendment Committee was only a fractional portion of the work of the Chamber, and that that work had always a most distinct and practical bearing upon the objects of the Chamber. The Chamber has been truly described as a Trade Vigilance Committee, and to all matters which affected the trade of the district the Chamber and its secretary had been fully alive. It was always their tradition to attach themselves to no particular industry or branch of trade; they looked at the trade of the district from a broad point of view, and never allowed themselves to deteriorate to the level of an employers' union. They were also a bureau of information. These statements he supported by giving instances of the Chamber's usefulness.

He did not propose to say anything of the position of trade and its prospects, for the simple reason that he was not qualified to do so, but he pointed out that there had been a decline in

the number of large bankruptcies in late years. This improvement he traced to the greater width and breadth of the trade basis, its greater elasticity and capacity to adapt itself to the needs of new markets and passing fashions. There was also the fact that the means of getting large credits for merely speculative transactions had been considerably constricted of late years. The diversity and elasticity of the trade he traced in turn to the better education of the workers and the leaders of trade.

The Chamber had always taken great interest in the growth and development of technical education, especially at the Bradford Technical College. Recently the Yorkshire College authorities had brought forward a scheme for the promotion of a higher technical or commercial education for the leaders or captains of trade. That movement he welcomed heartily, and the Chamber had supported it fairly well. The question was one of great importance, and would come before them still more frequently in the future. In Bradford they were capable of dealing with their own education, so far as it was purely technical, but they were quite willing to recognise that when it got beyond that mark, and became more of the college and University character, it was necessary to go to a college specially fitted for it—such as the Yorkshire College at Leeds. That college he should like to see placed upon a county footing as the basis of a Yorkshire University.

The minutes included those of a meeting of spinners, manufacturers, woolcombers, and general millowners in the Bradford district, held on January 14, to consider the desirability and practicability of starting all mills at the same time in the morning. A resolution was passed unanimously to the effect "that in the opinion of this meeting it is neither desirable nor practicable to start all mills at the same time, and that any future interference with the hours of labour by the Home Office is to be deplored."

Halifax.—The monthly meeting of this Council was held on the 29th December, the president (County Alderman J. W. Smithies) being in the chair. The president was re-elected, and Messrs. C. Holdsworth and J. H. Murgatroyd were re-appointed vice-presidents, all unanimously.

The Council cordially supported the suggestions of the Edinburgh Chamber in reference to the laying of main line telegraph wires underground, and expressed their willingness to join in the proposed deputation to the Postmaster-General on the subject.

It was reported that the United Committee of the Corporation, the Chamber of Commerce, and the Drapers and Hosiery Association had considered the letter from the National Telephone Company (Limited), of December 4, 1901, and could not recommend the Corporation to accept the terms offered by the company, but fully approved of the clause in the Corporation Bill, which is to confer powers to enable them to establish a municipal telephone. The action taken by the representatives of the Chamber in the matter was approved.

The Council resolved to petition Parliament in favour of the bill to amend the law relating to the rating of hereditaments containing machinery, and to ask the borough and county members to support the second reading of the bill.

A circular was read from the Huddersfield Chamber recommending that the Government be urged to increase the duties on German wines in the event of the German Tariff coming into operation. Mr. Firth moved a resolution approving of the principle expressed in this communication, but declaring that it did not go far enough. The resolution was carried. The Council also resolved to support the resolution before the House of Commons in favour of the appointment of a Minister of Industry and Commerce.

Leeds.—The annual general meeting took place on 29th December last, when the president, Mr. G. R. Portway, in moving the adoption of the report, said that during the past year the Chamber had applied to the Inland Revenue Office for increased stamping facilities in Leeds. Enquiries were at once instituted by the department, on whose behalf a gentleman came specially to Leeds, and within a very short time the application was granted. The concession would prove a great convenience to the city.

Considerable interest had been shown in the work of commercial education. Alderman Wurtzburg undertook to prepare a report on the present system so far as this district was concerned, and the report, for which they felt greatly indebted to Mr. Wurtzburg, was of great value. The authorities of the Yorkshire College had initiated a scheme for giving a course of higher commercial education. They asked for the assistance of the Chamber, and it was willingly given. The Chamber had obtained from a commercial community promises of about £200 for a term of three years, and their example had been an incentive to other bodies in the county. Bradford, he was glad to say, had obtained promises of a similar amount, and there was every prospect of the new course starting under very favourable circumstances. Another matter in which the influence of the Chamber had been felt, had reference to a trade dispute. The Leeds Cloth Pressers' Society brought under the notice of the Council a complaint with reference to the excessive length of worsted coatings which had to be manipulated by two men, and, as a result of the conference with the officials of the Society, they recommended the acceptance by the trade of a limit of 70 yards warp as the length of worsted coatings, the recommendation having been agreed to. There had been three discussions on the German tariff, but the subject had not yet been exhausted. Canal navigation, which was of great importance to the commerce of the country, had also occupied their attention, and a bill was being promoted for the formation of canal trusts and for the development of the waterways of the country.

Speaking of Parliamentary procedure, the President remarked upon the increasing influence and power of Chambers of Commerce with Government departments. The action of Chambers of Commerce had been distinctly felt in regard to underground telegraph wires. By the storm of a few weeks ago there was great interruption to telegraphic work. Several bodies addressed the Postmaster-General, and it looked from Lord Londonderry's letter as if the question was likely to be shelved. The Chambers again took the matter up. If the Press did not initiate the movement, at any rate it backed it up well. The result was a second letter from the Postmaster-General, the tone of it being very different from the first communication. They were told that the underground wire had been laid as far as Birmingham, and that the Post Office were going to push with all possible speed the work of connecting Liverpool, Manchester, and Leeds. In 1901 trade was not so easy to do as in the previous year, and prices were lower, yet there was only a falling off in our imports of £836,000 and in our exports of £6,028,000, the decline being accounted for by the difference in values.

Mr. J. Pente observed that they were all aware of the inability of the House of Commons, on account of present arrangements as to procedure, to satisfactorily deal with the subjects brought before its notice by Chambers of Commerce. There was no doubt that if the suggestion considered by the Chamber, on the initiative of the president, was put into operation, there would be a reform which would enable the House of Commons to carry out the wishes of Chambers of Commerce more effectively than they had been able to do in the past. With regard to the German tariff and the statement in the report that the Council "have not seen fit, having regard

especially to the export trade of this country, to recommend that retaliation should be resorted to," remarked that the subject of retaliation, directly or indirectly, had been considered by the Council and the committee appointed to consider the German tariff, and the action of the Germans would undoubtedly compel a greater amount of attention on the part of the commercial community to the question. The report indicated that we should have to look more to our colonies than we had hitherto done to make up for what had been taken from us through the operation of hostile tariffs. The time was coming when hostile tariffs would not be viewed in the light in which they had been regarded in the past.

Liverpool.—At a special meeting of the Liverpool Chamber on the 17th ult., Mr. G. H. Cox presided, in the absence of Sir A. L. Jones, when the subject of consideration was England's fiscal policy. Mr. Cox said that a very useful purpose might be served by a full and free discussion of the question, and even an attempt made to reach a closer understanding as to tariffs with their colonies. What he had seen and heard fully justified him in saying that protection was in the air, and it was most desirable that the subject should be ventilated. Bounties and subsidies were inimical to free trade and free exchange. They were justified in taking any necessary steps to restore freedom of exchange and to ensure, as Mr. Cobden said, that every source of supply was freely open to them. Mr. Alfred Bigland then read a paper on the subject indicated by the chairman. They should always be thinking of the future, he said, and not merely of to-day. He had drawn up a proposed contract with the colonies, in which he suggested there should be absolute freedom of interchange of all commodities, products, etc., as if the whole Empire were actually one great country. As this could not be done suddenly, it should be mutually agreed that the Government of every colony should for a term of years continue its present tariff, or a modification of it, but should in every item stipulate that goods grown or manufactured or obtained from any other part of the Empire should be admitted at half the fixed tariff. He further suggested the formation of a permanent council in London, with full colonial representation, to carry out the scheme. Councillor Austin Taylor concurred in what was said against bounties, but saw some difficulties. He elicited from Mr. Bigland the explanation that cotton and grain were not touched in his policy. Mr. A. Armour thought that Mr. Bigland's scheme would raise prices here, and would not be accepted in the colonies. Colonel Goffey said that he had been a free-trader all his life, but could not help seeing that in recent developments questions had arisen to necessitate reconsideration of the arguments held 50 years ago. No Englishman feared competition on fair and straight lines. How could any one meet the competition shipowners now had to meet? He referred to the bounties, for instance, the French Government gave to ships. British shipping could not fight against such competition. If the American Bill passed next year, all the energy and skill of British shipowners would not enable them to meet the Americans, backed up by an immense bounty and subsidy.

Manchester.—Mr. John Thomson, presiding at the annual meeting of the Chamber on the 5th ult., said that the future of the cotton trade looked more hopeful than it was a year ago. A discussion arose upon the following paragraph in the annual report of the directors, which referred to the new German tariff:—"Isolated suggestions have been put forward in this country favouring some sort of retaliatory tariff action on the part of the British Parliament in the event of the tariff being enacted. To such a course the board of directors is entirely opposed. No such action could be effectively taken by this country without the introduction of Customs duties which would confer in greater or less degree the privilege of protection upon British industries. It is the conviction of the board that any step of this nature would be fraught with the most momentous consequences, and that it should be resisted by the Chamber with the utmost earnestness and energy." Mr. H. E. Wollmer moved that this paragraph be struck out. Mr. Burges, who declared himself a protectionist, seconded the motion, which was in the form of an amendment to the resolution to adopt the report. Mr. Fogg opposed the amendment, and in the course of his speech claimed that the German imports were of benefit to our trade, a large proportion of them helping us in cheap manufacture, while our own production was not displaced by them, nor the employment of our people injured. The amendment received four votes and was rejected by a large majority. The report was then adopted. Mr. Marshall Stevens, one of the original promoters and the first manager of the Manchester Ship Canal, laid before the Chamber a series of tables dealing with the position of the port of Manchester in comparison with other ports.

Sheffield.—The annual meeting of this Chamber was held on 30th January last, at Sheffield, Mr. W. F. Beardshaw (the president) in the chair. After some remarks by Sir Howard Vincent on the proposed German tariff, and other matters, Mr. Batty Langley, M.P., said that, with reference to the suggested increase and revival of trade in South Africa, he was not so hopeful about it. South Africa, for three or four years, would be in a very quiet state so far as trade was concerned. There was a falling-off in the demand for labour in this country. There might be a boom in trade for a few months, but he believed there would be a reaction, and that there would be a very great disappointment after the war was closed. Mr. J. F. Hope, M.P., strongly supported the importance of commercial knowledge of foreign languages, and urged the Associated Chambers not to put forward long programmes, but to push strongly some one matter of the first importance, such as the adoption of the metric system. Mr. F. W. Beardshaw was re-elected president and Mr. Herbert Hughes was re-appointed secretary.

Walsall.—At the twentieth annual meeting of the Chamber held on the 24th ult., Mr. H. D. Clark presiding, the report of the Council stated that the membership of the Chamber had increased from 135 to 195. A large amount of the work undertaken had been of much interest and advantage to local industries and to the trade of the country generally. The saddlery, harness, and other leather industries had again during the past year benefited in a considerable degree by the demands of the War Office, but not to such an extent as in the previous year. The chairman, in moving the adoption of the report, expressed regret that the president (Mr. F. Rathbone) was unable through absence abroad to fulfil this duty, particularly as the success of the year's work was in a great measure the result of Mr. Rathbone's initiative. He believed they would all agree that the trade of the town, although not equal to the previous year's trade, was of a satisfactory nature. The War Office favoured the town with a large number of contracts, the effect of which had no doubt been to enhance the prosperity and wealth of the community. A reference to the Board of Trade's returns showed that the exports of saddlery and harness reached the largest total since the year 1890. The turnover for the twelve months was £585,225, as against £477,000 in the previous year. This, he believed, was the best trading record they had been able to point to, except in one instance, for twenty years, and it showed that not only had local manufacturers and merchants been busy upon War Office contracts, but that they had also been alive to giving attention to the other orders which had been received. This was particularly

gratifying, inasmuch as in every case the colonies had taken an increased amount of these commodities. Canada, Australia, British East Indies, and South Africa, all had augmented their demands, and the only falling off had been in regard to the Continent and South America, in each of which cases a satisfactory explanation for the decrease could be given. The trade of the country, as a whole, had also maintained a high standard. Twelve months ago they had to report that the United Kingdom did the largest volume of trade ever recorded, the total amounting to 877 millions. During last year there was a decrease of 6 millions, but compared with three years ago there had been an increase of over 100 millions in the general volume of trade; this was a most satisfactory state of things. The chairman afterwards reviewed the work of the Chamber during the past twelve months. Mr. T. A. Smith said the war had opened the eyes of the world to the fact that the horse was not likely to become such an extinct animal, with such disastrous results to Walsall trades, as some people thought would be the case when the motor-car was introduced. He thought the trade returns proved that the country had to look to the colonies for an expansion of trade rather than to foreign nations. Mr. A. W. Hutton said that as a result of the action of the Chamber progress was being made with the standardisation of tests of iron and steel. The resolution was carried unanimously.

GENERAL INTELLIGENCE OF THE PAST MONTH.

February, 1902.

UNITED KINGDOM.

FEB. 1st: The London Water Bill was issued. The Sanitary Inspectors' Association held their annual meeting. Small-pox increased in London. New transatlantic freight rates were announced.

2nd: Death of the Earl of Munster.

3rd: Alderman S. Roberts (C.) was elected M.P. for the Ecclestone Division of Sheffield. In the House of Commons a supplementary vote of £5,000,000 was passed for war charges, including cost of remounts. Lord Hamilton made a speech on the condition of India. The Queen and Princess Victoria left London for Sandringham. Death of Sir J. B. Mouclton.

4th: In the House of Commons a motion for the disestablishment of the Church of England in Wales was rejected. The Queen Victoria Memorial Fund amounted to £187,600. Sir W. Harcourt addressed a meeting of the National Poultry Organisation Society.

5th: The Chamber of Shipping held their annual meeting. Lord Salisbury was entertained at dinner by the Junior Constitutional Club. Princess Louise, Duchess of Argyll, distributed prizes at the Battersea Polytechnic. In the House of Commons, the Deceased Wife's Sister Bill passed the second reading.

6th: The Prince of Wales was formally admitted as a Fellow of the Royal Society. Mr. J. Wood (Land Purchase Candidate) was elected M.P. for East Down. Death of Col. W. A. J. Wallace, C.I.E.

7th: Sir C. P. Ilbert was appointed Clerk of the House of Commons in the room of Sir A. Milman, resigned. The Ven. Archdeacon Pryce was appointed Dean of Bangor. Death of Mr. T. Sidney Cooper, R.A., in his 99th year.

8th: A medallion of John Ruskin was unveiled in Westminster Abbey. Death of the Rev. G. Blunt, rector of St. Luke's, Chelsea.

9th: Death of the Rev. Sir George W. Cox. Death of Col. the Rt. Hon. W. Brownlow-Forde.

10th: The annual meeting of Governors of the Clergy Orphan Corporation was held. Small-pox increased in London. In the House of Lords it was announced that Wei-hai-wei was not to be fortified as a military and naval station.

11th: The King held the first levée of his reign at St. James's Palace. The London County Council adopted the report of the Water Committee on the London Water Bill. The National Education Association held their annual conference. Mr. J. Daly (N) M.P. for Monaghan, resigned his seat. Death of Sir Herbert Croft.

12th: Death of Lord Dufferin. The new entrance lock of the South-west India Dock was opened. A conference on Anglo-Russian trade was held at the London Chamber of Commerce Offices.

13th: Mr. Chamberlain was presented with an address from the Corporation of the City of London.

14th: Lord Rosebery addressed a great Liberal meeting at Liverpool. Death of Sir Archibald Milman. In the House of Commons, Mr. Jeffrey was elected Deputy Chairman to act as Speaker when required.

15th: The Army Estimates for 1902-3 were issued, amounting to £69,000,000. Death of General J. G. Touch.

16th: Death of Capt. W. T. Mainprize, R.N., C.B.

17th: In the House of Lords the Vaccination Act (1898) Amendment Bill was thrown out, and the Remounts question was discussed. Lieut.-Col. J. H. Eden was appointed an Inspector of Constabulary. Death of Sir Robert Micks. Death of Field Marshal Sir Neville Chamberlain.

18th: Death of the Rev. Dr. Newman Hall. A deputation waited on Mr. Chamberlain asking for transport for 500 Welsh settlers from Patagonia to Canada. In the House of Lords the Shops (Early Closing) Bill was negatived on the second reading. Death of Colonel E. C. Knox.

19th: The National Liberal Federation held its annual meeting at Leicester. A monument to the late Lord Leighton was unveiled in St. Paul's Cathedral. In the House of Commons the Urban Site Value Rating Bill was rejected. Death of Mr. P. W. Clayden.

20th: Death of Sir W. C. Leng. The Queen left Marlborough-house for Sandringham. Death of Earl Fitzwilliam. The National Labour Committee opened their annual conference in Birmingham.

21st: The King left London for Burton-on-Trent on a visit to Lord Burton. The Civil Service Estimates were issued.

22nd: The King visited Messrs. Bass & Co.'s brewery at Burton. The Consecration of Canon Gore as Bishop of Worcester took place in Lambeth Palace.

23rd: Death of Dr. S. R. Gardiner. Death of Lady Herschell.

24th: The King returned to London from Rangemore, Lord Burton's seat. Lord Tweedmouth addressed a Liberal meeting at Camberwell. It was resolved in Belfast to erect a memorial to the late Lord Dufferin. In the House of Lords the Cremation Bill was passed. Death of General Sir P. Penrose. Death of the Dowager Countess of Dundonald.

25th: The Bishop of Worcester was enthroned in Worcester Cathedral. Mr. Hebert Hart resigned the Chairmanship of the Liberal Imperialist League. The Shire Horse Show was opened at the Agricultural Hall. In the House of Commons the Navy Estimates were passed. Death of Lord John Hervey.

26th: A National Service League was established under the presidency of the Duke of Wellington. The metropolitan water companies issued a memorandum denouncing the Government Bill as violating the rights of property. Mr. M. D. Chalmers, C.S.I., was appointed to succeed Mr. C. P. Ilbert as First Parliamentary Counsel.

27th: The King visited the Shire Horse Show. The Duke of Devonshire presided at a meeting of the Liberal Unionist Council.

COLONIES.

Australia.—19th: Mr. Barton suggested that large horse-breeding stations should be established in Australia to supply the Army.

New South Wales.—10th: A patriotic demonstration took place at Sydney to support the Government policy with regard to the war in South Africa.—21st: It was proposed to establish works on the Parramatta river for the manufacture of steel rails from native ore.

Victoria.—24th: It was reported that Sir John Forrest would leave for England in May, and that he would become High Commissioner for the Commonwealth in London.

South Australia.—6th: The death of Sir John Colton, a former Premier, was announced.

Queensland.—4th: The Parliament was dissolved. In his election manifesto the Premier condemned the policy of the Commonwealth Government.

New Zealand.—1st: The 8th contingent left Auckland for South Africa.

British West Africa.—12th: More fighting with the Aros occurred. Major Heneker captured Ikarodaka, near Akweta, a stronghold of the Igas.—21st: The Aros were reported to be submitting and surrendering their rifles.

Canada.—6th: It was announced that Mr. David Mills, K.C., would resign the Ministry of Justice. It was reported that Ontario manufacturers were about to establish sample rooms in London, England.—8th: Mr. G. B. Hunter, of Newcastle-on-Tyne, stated that Canada would beat the world in the manufacture of steel ships.—11th: Mr. C. Fitzpatrick, K.C., was appointed Minister of Justice in succession to Mr. D. Mills, and Mr. H. Carroll became Solicitor-General.—13th: The Dominion Parliament was opened.—20th: The British Empire League of Canada held its annual meeting.—24th: Sir Charles Tupper advocated the principle of a mutual preferential trade policy as a means of consolidating the Empire.—25th: Senator Templeman, of British Columbia, became a Minister in the Dominion Cabinet without portfolio.

Cape Colony.—6th: The weekly mail train service to the north was resumed. Sir W. Hely Hutchinson returned to Cape Town.—8th: A meeting was held in Cape Town to protest against the slanders on British troops.—10th: Death of the Bishop of Pretoria.—18th: Commandant Judge Hugo was captured near Hangfontein.

Malta.—8th: A proclamation was issued formally withdrawing the announcement that English would become the official language of the Law Courts.—10th: The Governor announced that a change in the Constitution would have to be effected, if the Council persisted in refusing to vote the taxes necessary for the Administration.—16th: The elected members of the Council resigned as a protest against the Governor's notification.—19th: The official members of the Council passed the education vote and other necessary estimates.

Natal.—26th: The Parliament was opened.

Newfoundland.—11th: The winter herring fishery was reported to be one of the best on record.—20th: The Legislature was opened.—26th: The Bill for renewing the *modus vivendi* was read a second time.

Orange River Colony.—7th: De Wet broke through the blockhouse line near Liebenberg Vlei, and escaped with about 30 followers: 283 Boers were killed, wounded, or taken prisoners, and 700 horses were captured.

Transvaal.—2nd: Colonel Byng routed a Boer force under Commandant Wessels.—4th: Further large captures of Boers were reported.—5th: A number of mines on the Rand were permitted to resume working.—10th: Lord Kitchener reported further Boer casualties and captures. The strength of the Boer forces in the field was stated to be 12,000.—15th: Twenty-five additional Boer leaders were banished. 3,000 Boer refugees were removed from Pietersburg to Colenso.—17th: The first meeting of the new Town Council of Pretoria was held; it was announced that the seat of Government would not be changed.—20th: A Boer force of 164 men was captured on the Botha Berg near Middelburg.—21st: The Transvaal Customs returns for 1901 showed a total of £500,444, on imports to the value of £3,664,149. The Gold Commission concluded its sittings at Johannesburg.

INDIA.

4th: The number of persons on famine relief was 223,000.—9th: The Afridis raided a village near Jamrud.—11th: The number on famine relief was reported to be 280,000.—15th: The number of persons on famine relief increased to 307,000.—24th: The Mahsud Waziris paid their fine and delivered up 60 rifles.

FOREIGN COUNTRIES.

Afghanistan.—18th: It was reported that the widow of the late Ameer and her younger son, Nasrullah Khan, were likely to give trouble to the Ameer Habibullah.

Argentine Republic.—22nd: Sir T. Holdich arrived at Buenos Ayres.

Austria-Hungary.—15th: Labour riots occurred at Trieste.—17th: A number of anarchists were arrested in Trieste.—21st: Death of Dr. Emil Holub, the African explorer.

Belgium.—22nd: The Sugar Conference re-assembled in Brussels.

Bulgaria.—6th: M. Kantcheff, Minister of Public Instruction, was assassinated in his office.—23rd: Miss Stone, the American missionary, was released by the Bulgarian brigands at Strumetza in Macedonia.

China.—1st: The Dowager Empress gave audience to the ladies of the Legations.—2nd: Yung Lu was appointed Grand Secretary. Edicts were issued legalising marriages between Manchus and Chinese, and urging the abandonment of the custom of foot-binding among females.—6th: The Germans acquired exclusive mining rights over a large area in Shan-tung. The British and Japanese Ambassadors protested against the Manchurian agreement.—8th: The Government dismissed all European professors at the Imperial University.—10th: It was reported that a German mission in Kwantung had been destroyed.—14th: The Anglo-Japanese treaty of alliance was cordially welcomed by the Chinese.—22nd: The Russian Government declared that Manchuria would never be closed to American trade and commerce.—24th: The New Year's reception of the Diplomatic Corps by the Dowager Empress

took place.—25th: The United States proposed that the indemnity total should be kept within the amount of 450,000,000 taels.

Cuba.—1st: The condition of the island was reported to be alarming.—24th: It was announced that the Cuban Electoral College had selected Señor Palma and Señor Estevez as President and Vice-President respectively, of Cuba.

Denmark.—14th: Many protests were made against the sale of the Danish West Indies.

Egypt.—16th: Lord and Lady Cromer visited the Assiut barrage works, and Lady Cromer laid the coping stone of the works.

France.—1st: President Loubet signed a decree curtailing the powers of the head of the Naval General Staff.—8th: Prince Victor Napoleon issued a manifesto to the Imperialists condemning the Parliamentary system.—14th: The Chamber voted the abrogation of the Falloux law, guaranteeing liberty of instruction in France. M. Santos Dumont's balloon fell into the sea near Monte Carlo.—21st: The Senate voted 80,000fr. for the celebration of the Victor Hugo centenary.—26th: The Victor Hugo centenary was celebrated at the Panthéon.

Germany.—7th: The Navy Estimates were adopted by the Reichstag. Steps were taken to suppress faith-healing and so-called Christian science in Germany.—10th: The Agrarian League opened its annual congress in Berlin.—11th: Herr von Walzdorf, Finance Minister in Saxony, resigned.—14th: The Tariff Bill Committee carried a resolution that the new tariff must come into force not later than January 1, 1905.—15th: Prince Henry of Prussia left Bremerhaven for New York.—20th: The annual congress of the Navy League was held in Berlin.

Holland.—5th: Conferences were held at Utrecht between the Boer delegates, Dr. Leyds, and Mr. Kruger.—13th: The Boer delegates left the Hague for New York.

Italy.—20th: Parliament was opened.—21st: Signor Zanardelli's Cabinet resigned.—23rd: At the instance of the King the Ministry withdrew their resignations. Strikes of gas-work artificers and railway workers occurred in Turin.

Japan.—12th: An important treaty between Great Britain and Japan with regard to China and Korea was announced in the Diet.

Morocco.—23rd: The Sultan gave his approval to the proposed railway line from Duvyrier to Djenan-ed Dar.

Roumania.—23rd: A serious disturbance took place in Bukharest.

Russia.—1st: Count Tolstoi was reported to be seriously ill.—4th: It was announced that no foreigners would be allowed to travel by the Port Arthur-Petersburg route without special authority.—7th: The Archduke Franz Ferdinand of Austria arrived in St. Petersburg, and was met by the Tsar and the Grand Duke.—15th: A severe earthquake occurred in the Schemacha district in Transcaucasia.

Spain.—7th: The Chamber of Deputies passed a Bill proposing that the Customs duties on certain articles should be paid in gold.—17th: Serious labour riots occurred at Barcelona.—21st: Martial law was proclaimed in Zaragoza and Tarragona.

United States.—1st: Mr. Shaw became Secretary to the Treasury, in succession to Mr. Gage.—9th: A great fire occurred at Patterson, New Jersey.—17th: The Senate ratified the Treaty with Denmark for the cession of the Danish West Indies.—21st: The final ratifications of the Hay-Pauncefote treaty were exchanged in Washington.—23rd: Prince Henry of Prussia arrived at New York.—24th: Prince Henry visited Washington, and was received by the President at the White House.—25th: The President and Prince Henry travelled to Jersey City, where the Emperor's new yacht *Meteor* was launched. The Senate passed the Philippines Tariff Bill.

Uruguay.—14th: Dr. Juan Carlos Blanco was re-elected President of the Senate and Vice-President of the Republic.

Mexican Sugar.—The sugar industry of Mexico (states the *Board of Trade Journal*) is beginning to be largely developed. In all parts capitalists are forming companies for the cultivation of the sugar-cane. There is, it is said, a marked tendency among Mexican cultivators to abandon the cultivation of maize for the more remunerative one of the sugar-cane. It is estimated that the area of sugar-cane plantations has increased by about 22 per cent. during the past season.

Turkestan Silk Industry.—It is stated in the *Journal de la Chambre de Commerce de Constantinople* that the entire supply of silk required in Russia will probably in a few years be furnished by Turkestan. In recent years as much as 400,000 pounds (pound = 36 lb. avoirdupois) of raw cocoons has been produced, although the rearing of silkworms is still conducted on the most primitive principles. The chief silk-rearing centres are Khokand, Andischan, Samarcand, Tashkent, etc. Eggs of French origin are chiefly used, mixed with some raised in the country itself. The price of cocoons varies at present from 8 to 9 roubles per pound.

Steel Chain Making.—A demonstration of the advantages claimed for a new steel link belting and the method of its manufacture has recently been given. The ingenious machine, which at a single process converts a ribbon of steel into a connected link chain without any waste of the metal, is the invention of Mr. Sylvanus D. Locke, and is said to have been for some time successfully worked in the United States. It is now intended to erect plant in this country, and to exploit the belting on the English and European markets. It is said that the invention will bring about the introduction here for the first time of link-belting made of high-grade tempered steel instead of malleable iron. The difference between the new and the old is, indeed, primarily the substitution of steel for iron.

Russian Trade with Persia.—The Russian Minister of Finance has authorised the total remission of the excise duty on matches manufactured in Russia and imported into Persia through the Russian Customs post at Sarakhs, in South-west Turkestan. In the case of sugar exported from Russia into Persia through Sarakhs the excise duty will be collected in the ordinary way, but refunded to the Russian exporter on verification of the bills of consignment by the excise authorities at Astrakhan, Petrovsk, or Baku. The match trade with Persia, though a comparatively trifling item in Russian exports, is none the less instructive, furnishing as it does under these new conditions a striking example of the latest prohibitive methods of Russian competition in Persia. The total remission of excise on matches renders it possible to deliver Russian matches into Persia at the cost of less than one farthing per hundred, a figure 20 per cent. below their retail price in Odessa, while the average inhabitant of Northern Persia can buy 10 lb. of Russian sugar for less than a Russian can buy 6 lb. in the town of Kieff, in spite of the fact that the latter lives in the leading centre of Russian sugar production, while the former has his sugar delivered to him by rail, steamship, and caravan at a distance of over 1,200 miles from the Russian sugar manufactory.—*Times*.

FORTHCOMING EVENTS.

UNITED KINGDOM.

Bristol.—On the 5th inst. the PRINCE and PRINCESS OF WALES will visit Bristol and cut the first sod of the new dock at Avonmouth.

Dartmouth.—On the 7th inst. the KING and QUEEN will lay the foundation stone of the new Naval Cadet College.

Devonport.—On the 8th the QUEEN will launch the battleship *Queen* at Devonport.

London.—On the 4th inst. the annual meeting (three days) of the ASSOCIATION OF CHAMBERS OF COMMERCE will begin.—On the 7th inst. the London Committee of the WOLVERHAMPTON ART AND INDUSTRIAL EXHIBITION will meet at the Mansion House, the Lord Mayor presiding; in the evening Sir George Hayter Chubb will entertain the London Committee and the Executive at the Whitehall rooms.—On the 11th, at the Royal Colonial Institute, Lord Lamington will read "SOME NOTES ON QUEENSLAND."—On the 14th the KING and QUEEN will hold a Diplomatic and Official Court at Buckingham Palace.—On the 19th the PRINCE OF WALES will open the NATIONAL PHYSICAL LABORATORY at Bushey House.

An INTERNATIONAL EXHIBITION OF MOTOR-CARS, etc., will be held at the Royal Agricultural Hall from the 19th to the 26th April.

A COLONIAL EXHIBITION, consisting of the colonial exhibits which were at the Glasgow Exhibition, will be opened at the Royal Exchange on the 10th inst., by the Lord Mayor in state. Among the colonies represented in the exhibits will be Canada, including Ontario, Quebec, Nova Scotia, New Brunswick, Manitoba, Prince Edward Island, British Columbia, the North-West Territories, and the Yukon, and also Australia, South Africa, and British North Borneo. The exhibition will remain open for six weeks.

Manchester.—On the 12th inst. the PRINCE and PRINCESS OF WALES will visit Owens College, Manchester.

COLONIES.

Cape Colony.—A *Reuter* telegram, dated February 21, states that a BRITISH COLONIAL AND INDUSTRIAL EXHIBITION will be opened at Cape Town in November, 1903.

FOREIGN COUNTRIES.

France (Aix-en-Provence).—An INTERNATIONAL AND COLONIAL EXHIBITION will be held at Aix-en-Provence from the 27th April to the 28th July next, under the auspices of the municipality of that town. The exhibition will comprise commercial, industrial and agricultural products, and also include sections relating to teaching and the arts. An area of about 25,000 square metres will be utilized. Applications for permission to exhibit will be received up to the 17th March next at the offices of the Administration, Rue de l'Opéra 9, Aix-en-Provence.

French Indo-China.—The Acting British Consul for Siam and Mengtse, in a recent report to the Foreign Office (No. 2,741), draws the attention of all British manufacturers having dealings with the Far East to the exhibition that is to be held at Hanoi during 1902. Every facility will be offered by the promoters to intending exhibitors, and it is hoped to make the exhibition thoroughly representative of the Far East.

Japan (Osaka).—Intending exhibitors at the FIFTH DOMESTIC EXHIBITION, to be held at Osaka from the 1st of March until the 31st July, 1903, should send in their applications to the Vice-President of the Fifth Domestic Exhibition Bureau, Osaka, before the 30th June next.

NAVAL AND MILITARY INTELLIGENCE.

NAVAL.

Admiral Sir C. G. Fane has been placed on the retired list, to date from January 25.

Commander W. V. Anson has been placed on the retired list with the rank of Captain, to date February 6.

The Admiralty have ordered blocks to be laid in No. 4 dock at Sheerness Dockyard for building a new sloop of the *Odin* class of 1,096 tons displacement.

The *Diadem*, cruiser, Captain Henry Leah, of the Eastern Division of the Channel Squadron, was paid off at Chatham on the 18th ult.

The *Goldfinch*, gunboat, was commissioned at Sheerness Dockyard on the 4th ult. by Commander F. C. Larnmouth, for surveying service abroad.

The King's yacht has been ordered to be ready to leave Portsmouth for Plymouth for His Majesty's use there on March 3.

The new cruiser *Hogue*, at Devonport, will be ready for her gun trials early next month, and can be prepared for commission by the end of June.

The Devonport Dockyard officials have informed the Admiralty that the refit of the battleship *Hove* will occupy at least a year, owing to the serious defects of her machinery.

Rear-Admiral Lord Charles Beresford, lately second in command of the Mediterranean Squadron, arrived in London on the 20th ult.

Vice-Admiral Sir C. E. Domville has been promoted to be Admiral, Rear-Admiral A. D. Fanshawe to be Vice-Admiral, and Captain Sir Edward Chichester, C.B., to be Rear-Admiral; to date from January 25.

Major H. W. L. Holman, R.M.L.I., attached to the Naval Intelligence Department at the Admiralty, has been appointed A.D.C. to the new Governor of New South Wales, Vice-Admiral Sir Harry Rawson.

On the occasion of the visit of the King and Queen to Dartmouth on March 7, the cruiser *Australia* will act as guard-ship, and several destroyers will line the river from Kingswear to Dartmouth.

Extensive preparations are being made at Chatham Dockyard for the launching of the battleship *Prince of Wales*, the naming ceremony of which vessel is to be performed by Her Royal Highness the Princess of Wales, on the 25th inst.

The cruiser *Good Hope*, the gift of the Cape Government, which is also to figure prominently at the Coronation Review, is now to undergo trials which will be of an unusually interesting character, and more severe than those to which new cruisers are generally submitted.

The new battleship *Bulwark* will be commissioned at Devonport on March 18 for service on the Mediterranean. She will probably replace the *Ramillies* as flagship of the second-in-command. The *Bulwark* will have a complement of 780 officers and men.

The *Irresistible*, battleship, was commissioned on the 4th ult., at Chatham by Captain G. M. Henderson and 870 officers and men for service as port guardship at Gibraltar, in the place of the *Devastation*, battleship, Captain F. G. Kirby, which is to return to England to be paid off.

Rear-Admiral Sydney M. Eardley Wilmot has been appointed Superintendent of Ordnance Stores, in the Department

of the Director of Naval Ordnance, from the 25th ult., in succession to the Storekeeper-General of Naval Ordnance, Colonel Sir Thales Pease, K.C.B.

In order to maintain the efficiency of torpedo-boat destroyers the Admiralty have pointed out to local naval authorities the necessity of leaving a nucleus of the engine-room staff in each vessel when the crews are changed. Such nucleus should consist of an engineer officer, one engine-room artificer, and two chief or leading stokers.

The armoured cruiser which is to be built at Chatham is to be named *Devonshire*. She will have a length of 450 ft., a breadth of 67 ft., and a displacement of 10,200 tons. The new vessel will be the longest that has ever been built at Chatham. She is to be constructed on the slip which is at present occupied by the *Prince of Wales*, battleship.

The second-class cruiser *Doris*, late flagship at the Cape, whose ship's company took a prominent part in the early part of the South African campaign with the Naval Brigade, will shortly be commissioned at Devonport for a further term of service on the same station. The *Doris* will relieve the cruiser *Gibraltar*.

The *Thistle*, gunboat, was commissioned by Lieut. and Commander E. S. Houseman at Devonport, on the 18th ult., to relieve the *Buzzard*, sloop, Commander L. F. G. Tippinge, on the North America and West Indies Station. The *Thistle* arrived at Devonport in 1899, but this is her first commission. She was built for river service.

Admiral Sir John Fisher, Commander-in-Chief of the Mediterranean Squadron, has been appointed Second Naval Lord at the Admiralty in the room of Admiral Douglas, who is to be appointed to the North America Station. Admiral Sir Compton Domville will succeed Sir J. Fisher in the chief command in the Mediterranean.

Experiments in wireless telegraphy have taken place between the Admiralty station at Dover at a point known as Spion Kop, near Shakespeare Cliff, and a cruiser steaming down the Channel. By the use of a special mechanism, which is stated to be a new invention and was tried for the first time, messages were successfully transmitted to a distance of about 40 miles further than had previously been obtained. The object of the authorities is to have wireless communication from Dover with Portsmouth on the west and Sheerness on the east.

Experiments have been conducted with regard to coaling ships at sea, while under way, between the battleship *Trafalgar* and the specially fitted collier *Muriel*. In the trials which have recently been concluded, the *Trafalgar*, while towing the *Muriel* at the rate of ten knots, managed to ship an average of 30 tons of coal per hour. While steaming at a slower speed, he amount of coal transported from the *Muriel* to the *Trafalgar* was 40 tons per hour. This performance is eminently satisfactory, considering that the system is almost in its initial stage.

The largest floating-dock in the world was launched on the 8th ult., at Wallsend-on-Tyne by Messrs. Swan and Hunter for the Admiralty, to supersede the old floating-dock at Bermuda placed in 1869, which is now obsolete. The new dock will accommodate for repairs the largest battleships and cruisers up to 17,500 tons. The launch was very successful. The rocky nature of the island of Bermuda made a floating-dock more suitable than a graving-dock of the ordinary kind. The dock will be towed to Chatham, thence to Bermuda. It is 545 ft. long and 100 ft. wide. It has been built specially strong in view of its passage across the Atlantic.

The second of the flotilla of submarine boats building by Messrs. Vickers, Sons, and Maxim, Limited, at Barrow, was launched on the 21st ult. The new boat is about 60 feet long, the dimensions being similar to those of the experimental boat now undergoing her trials. It has been found necessary, however, that certain alterations should be made in its construction, rendered advisable by defects which have been discovered during the testing of No. 1 boat. It is expected that three of the remainder of the flotilla will be ready for launching within a very short time, and the sixth, which is of a new type, may be completed in time to take part in the Coronation Naval Review.

The *London*, battleship, which left Portsmouth on the 3rd ult., for her 30 hours' trial at four-fifths power, returned at the end of a 26 hours' run and reported that the trial was satisfactory, but that it had to be curtailed because thick weather set in. As the results of these trials are calculated on the mean of the best consecutive 24 hours rather than upon the complete run of 30 hours, sufficiently good averages were obtained to allow the trial to be accepted as successful. The ship drew 26 ft. 3 ins. forward and 27 ft. 3 ins. aft, and had 262 lb. of steam in her boilers. The vacuum, starboard and port, was 26 ins., and the revolutions were 101.4 starboard and 100.7 port, produced by a mean i.h.p. of 11,718. There was no air pressure, and the speed by patent log was 16.4 knots on a coal consumption of 1.8 lb. per unit of power per hour. The *London* was brought into Portsmouth Harbour on the 13th ult., in order that she may be completed for sea. She has successfully undergone her machinery, torpedo, and gun trials, and is to be ready for commission by the end of April. The *London* will eventually relieve the *Majestic* as senior flagship of the Channel Squadron. She is expected to fly the Prince of Wales's flag as Admiral of England at the Coronation Review in June next.

Italy.—On the island of San Paolo, near Taranto, an armoured tower has been constructed by the Italian Government which has a weight of 5,000 tons, and has cost £480,000. It is armed with two hydro-pneumatic guns having a length of 42.65 ft. and a range of rather more than 11 miles.

Russia.—The work at the Russian Admiralty yards at Sevastopol and Nikolaieff is being pushed on with undiminished vigour. The latest addition to the battleship strength of the Black Sea fleet, the *Potenkin Tauritchsky*, is having her armour plates fixed in place. The work on two new cruisers and two sea-going torpedo-boats at Sevastopol and Nikolaieff is also well advanced. The *Novoe Vremya* states that the Russian Admiralty has ordered that during the present year the four new deep sea torpedo-boat-destroyers *Pavlin*, *Phazan*, *Lebed*, and *Pelikan* shall be transferred from the Baltic to the Black Sea fleet. An extraordinary vote of £1,650,000 will be made shortly for the purpose of building new warships for the Russian Navy during the present year. The Marine Technical Committee is already engaged in deciding upon the type of the projected vessels, not one of which is to be built abroad. The transport vessel *Ocean*, which was built recently at Kiel for the Russian Navy, is to be set apart specially for training assistant-engineers for the Navy.

MILITARY.

Major W. A. C. Denny, Army Service Corps, has been appointed D.A.A.G. at Hong Kong.

Captain Duncan, D.S.O., 1st Royal Scots, has been appointed Brigade Major of the Infantry Brigade at Malta.

Captain R. V. H. Alpin, 6th Battalion Lancashire Fusiliers, has been appointed Aide-de-Camp to Sir Cornelius Moloney, K.C.M.G., Governor of Trinidad.

Lieut.-Colonel T. D. Foster, Army Service Corps, lately serving in South Africa, has been appointed Deputy-Assistant Adjutant-General for Supply Inspection from the 1st prox., succeeding Major C. W. King.

Colonel W. S. Clarke, formerly commanding the 2nd Worcestershire Regiment, has been appointed to succeed Colonel De Berniere in command of the 29th Regimental District.

Brevet Lieut.-Colonel Lempriere has been appointed second in command of the 2nd Middlesex Regiment, *vice* Major Barnardiston, appointed Military Attaché in Holland and Belgium.

Colonel Scott, R.A., who has of late been employed at the India Office, has been appointed Director-General of Ordnance in India, in succession to Major-General R. Wace, C.B., appointed Ordnance Consulting Officer in London.

The War Office has notified that the South African medal is to be granted only to the militia units who volunteered for service abroad during the South African war, and whose services were accepted.

Brigadier-General Sir Hector MacDonald, D.S.O., now in command of a second-class district at Belgaum, Madras, has been appointed to succeed Major-General F. T. Hobson in command of the forces in Ceylon.

Official notification of the change in the composition of cordite has been made to contractors who supply the Government with ammunition. The charges with the improved cordite for the various service weapons will be as follows:—4.7-in. quick-firing gun, 5 lb. 7 oz.; 12-pr. quick-firing gun, 1 lb. 10 oz.; 6-pr., 7½ oz.; 3-pr., 6½ oz.; and the 303 service rifles, 30 grains.

The present type of ambulance waggon in use in the army does not appear to be altogether satisfactory, and the War Office are desirous of obtaining a new model. They are therefore offering two prizes—one of £500 and the other of £250—for the two best models sent in. Any British subject may compete, and the entry list will be closed on March 15. The waggons, however, need not arrive at the Woolwich Arsenal before the middle of July. There are certain qualifications which the waggons will be expected to possess. They must, of course, be light, strong, and capable of running smoothly over rough roads. In the matter of accommodation they must have room for four patients lying down, or twelve sitting, one hospital orderly, and a driver.

Navy Estimates for 1902-3.—The amount of the navy estimates for the year 1902-3 is £31,255,000; besides the construction of new ships, there is a plan of modernisation of the armament of many of the older armoured and protected vessels at present with the fleet. The aggregate expenditure is an increase over last year (including supplementary vote) of £179,500. New construction takes up £9,058,000, and embraces: 2 battleships, 2 armoured cruisers, 2 third-class cruisers, 4 "scouts," 9 destroyers, 4 torpedo boats, 4 submarines—total, 27 of all types. Twenty-five ships are to be "improved." Eight battleships of the *Royal Sovereign* class are to have secondary batteries on upper deck (comprising six 6-in. quickfiring each) placed in armoured casemates. Battleships *Barfleur* and *Centurion* are each to have their ten 4.7 guns, firing a 50 lb. shell, replaced by 6-in. quickfiring, firing a 100 lb. shell. Cruisers *Powerful* and *Terrible* are each to have four more 6-in. quickfiring in casemates added, increasing the total number of these weapons to sixteen. Thirteen cruisers of the *Arrogant* and *Talbot* classes are each to have six 6-in. quickfiring in place of 4.7 in. weapons. Between April 1st, 1901, and March 31, 1902, inclusive, the following ships will have been completed and passed into the Fleet Reserve:—Battleships: *Formidable*, *Implacable*, *Irresistible*, *Bulwark*, *Vengeance*. Armoured cruisers: *Aboukir*, *Cressy*, *Hogue*, *Sulej*. First-class cruiser (protected): *Spartiate*. Third-class cruiser (protected): *Pandora*. Royal yacht: *Victoria and Albert*. Sloops: *Mutine*, *Rinaldo*, *Espiegle*, *Fantome*. River steamers: *Teal* and *Moorhen*. 22 destroyers, 4 torpedo-boats, 5 submarines. A new class altogether is to be created in the "Scouts," which are to be destroyers of "greater sea-keeping power." Seamen throughout the fleet are to have a new dietary.

For the use of these tables the following explanation is necessary:—The figures in heavier type represent either of the columns beside it, as the case may be; viz., with hectares and acres in the first set of columns, 1 acre=0.405 hectare, and vice versa, 1 hectare=2.471 acres, and so on.

STATISTICAL NOTES.

Ceylon.—TEA EXPORTS, 1901.—The following table, taken from Gow, Wilson and Stanton's report, shows the distribution of tea exports from Ceylon, from 1st January to end of December, during the four years, 1898-1901:—

COUNTRIES.	1901.	1900.	1899.	1898.
United Kingdom	105,734,570	113,760,193	103,948,124	96,133,833
Austria	50,958	24,633	8,231	14,873
Belgium	17,781	22,954	14,424	13,590
France	317,866	326,800	98,952	100,001
Germany	586,104	402,717	346,959	352,252
Holland	19,041	2,000	30,211	26,351
Italy	13,924	8,332	13,521	6,730
Russia	9,653,896	8,917,185	3,949,740	2,714,003
Spain	250	17,730	18,700	44,650
Sweden	65,104	71,300	78,088	42,471
Turkey	40,978	47,009	18,733	73,974
India	1,139,113	1,144,013	567,616	1,091,559
Australia	20,652,804	17,606,912	15,606,833	15,126,891
America	4,502,131	3,980,680	3,080,002	2,180,188
Africa	395,730	280,699	288,239	372,242
China	2,694,819	1,262,463	1,384,490	1,185,445
Singapore	147,560	119,178	83,813	59,867
Mauritius	55,376	17,323	100,248	33,299
Malta	312,633	419,518	257,232	196,852
Total lb.	146,310,638	148,431,639	129,894,156	119,769,071

Natal.—TRADE IN 1901.—The following table showing the values of the imports into and the exports from Natal, and the Customs revenue of the Colony for the year ended 31st December last, as compared with the preceding year, is based on official figures published monthly in the *Natal Gazette*:—

	1900.	1901.
Imports	£5,911,518	£9,822,686
Exports—		
Colonial	571,346	1,205,973
Non-Colonial	563,976	3,062,844
Total exports	1,135,322	4,268,817
Customs revenue	655,042	812,375

NOTE.—The figures for 1901 are approximate only.

Included in the non-colonial exports is raw gold to the value of £1,150 in 1900, and £764,993 in 1901.

The imports as shown in the above table include the value of goods imported overland (i.e. overland from the Transvaal, Orange River Colony, and other places), as well as those imported by sea.

Sweden.—IRON INDUSTRY.—The following table shows the quantities of the various kinds of iron, etc., exported from Sweden during the year 1901, as compared with the preceding year:—

EXPORTS OF IRON, ETC.

	1900.	1901.
	Tons.	Tons.
Pig-iron	84,500	84,600
Scrap-iron	—	8,100
Ingots	9,000	5,900
Bloom-iron and rough bars	21,900	18,200
Bar-iron	164,200	142,100
Bar ends	5,100	3,200
Iron wire in coils	5,500	4,400
Sheet-iron	2,500	1,500
Tubes and parts of tubes	—	6,000
Drawn wire	1,000	900
Nails	2,700	3,000
Total	296,400	277,900

The following table shows the production of iron in each of the years 1900 and 1901:—

PRODUCTION OF IRON.

	1900.	1901.
	Tons.	Tons.
Pig-iron	520,600	513,300
Bloom-iron	189,500	164,700
Bessemer ingots	91,500	77,300
Siemens Martin ingots	200,400	181,100

British Fuel Exports.—In spite of the influence of the coal tax, the total quantity of coals and coke sent out of the Tyne last year was above that of the preceding year. The exact shipments were from the River Tyne in 1901, 14,933,635 tons of coal and coke; in 1900, the quantity was 14,520,929 tons. There was thus an increase of 412,706, which is a substantial increase. The total includes fuel exported, fuel sent coastwise, and fuel shipped for the use of the steamers themselves. It is noteworthy that the coals sent out of the river increased by more than 518,000 tons, but there was a decrease in the coke exports of over 105,000 tons, so that the net increase was that above stated. The shipment of coals and coke is now one of the greatest of the industries of the North, and it is satisfactory from that point of view to find that there was, in a year of trial to the trade, the very large increase on the figures of the preceding year, though the shipment has been one that has been at a lower value on the average.—*Newcastle Chronicle*.

IMPERIAL INSTITUTE JOURNAL.

VOL. VIII. No. 88.

LONDON.

APRIL, 1902.

GENERAL NOTICES.

"THE IMPERIAL INSTITUTE JOURNAL."

Fellows resident in the United Kingdom, the Colonies, India, and Foreign Countries, are supplied with the JOURNAL free by post each month.

The Subscription to the JOURNAL from other than Fellows, both at home and abroad, is as follows, including Postage, and Posted Monthly:—

Yearly . 8s. 6d. | Half-yearly . 4s. 6d. | Quarterly . 2s. 6d.

Subscribers to the JOURNAL can have it forwarded by post on each day of publication by payment in advance. Post Office Orders or Cheques should be made payable to the Editor, at the Imperial Institute, South Kensington, S.W., to whom also all communications relating to the JOURNAL should be addressed.

The JOURNAL may also be purchased for Sixpence each copy at the Ticket Office of the Institute and at the railway book-stalls of Messrs. WILLING & Co.

The City Agents for the JOURNAL are Messrs. WILLING & Co., 17, Royal Exchange, London, E.C. It may also be obtained at the offices of the printers, WATERLOW & SONS LIMITED, Blomfield-house, London-wall, London, E.C.

Communications respecting Advertisements should be addressed to the ADVERTISEMENT MANAGER, 6, Arundel-street, Strand, London, W.C.

 This JOURNAL is distributed (by post) throughout the United Kingdom, India, and the Colonies of the British Empire, and to the following Foreign Countries:—Argentine Republic, Austria-Hungary, Belgium, Bolivia, Chili, China, Colombia, Costa Rica, Denmark, Egypt, France, Germany, Greece, Hawaiian Islands, Holland, Italy, Japan, Mexico, Montenegro, Morocco, Norway, Persia, Peru, Portugal, Russia, Siam, Spain, Sweden, Switzerland, Tripoli, Turkey, United States of America, Uruguay, and Venezuela. The JOURNAL is also placed in the Reading Rooms of CHAMBERS OF COMMERCE, CLUBS, and HOTELS, both at home and abroad.

SPECIAL NOTICE.

EXHIBITION OF GIFTS AND ADDRESSES PRESENTED TO THE PRINCE AND PRINCESS OF WALES, DURING THEIR COLONIAL TOUR IN 1901.

His Royal Highness the PRESIDENT of the IMPERIAL INSTITUTE has decided that an EXHIBITION shall be held in the North Gallery of the Institute of the GIFTS and ADDRESSES presented to their Royal Highnesses the PRINCE AND PRINCESS OF WALES on the occasion of their visiting the Colonies in 1901. The Exhibition will be open to the Public (Admission 1s.) on the 15th May, from 11 a.m. to 7 p.m., and until further notice. The PRINCE OF WALES has also decided that the proceeds of the Exhibition shall be added to the "CORONATION GIFT" to KING EDWARD'S HOSPITAL FUND.

FELLOWS' DEPARTMENT.

The Reading, Writing, and News Rooms, are open for the use of Fellows every week-day from 10 a.m. till 11.30 p.m., and on Sundays from 3 p.m. to 10.30 p.m. The Library (on the First Floor), is open from 10 a.m. to dusk on Week-days; and from 3 p.m. to dusk on Sundays. The Map Room (First Floor) is open from 10 a.m. to 5 p.m. on Week-days.

The Poste Restante is open every week-day for receipt and delivery of letters and parcels. Letters addressed to initials only are not received, except in reply to notices in the JOURNAL, under "Requirements" Registry. The General Post Office Pillar Box is cleared daily twelve times, between 10.10 a.m. and midnight. Light refreshments only are, for the present, provided in the Fellows' Rooms and at the bar of the Ceylon Kiosk.

EMIGRATION INFORMATION OFFICE.

The Office of the British Women's Emigration Association (see page 106), in the West Corridor, First Floor, is open daily from 10 a.m. to 4 p.m., and advice and information respecting emigration and openings in the Colonies may be obtained there free of charge. Enquiries of all kinds relating to the Colonies from intending Emigrants are dealt with in the Commercial Intelligence Department, and special information respecting Canada and the Cape Colony may also be obtained from the Curators for these Colonies, on application personally at their offices, or by letter.

SCHOOL OF MODERN ORIENTAL STUDIES.

An "Ouseley" Scholarship of £50 per annum, tenable for two years, will be awarded, should sufficient merit be shown, for proficiency in PERSIAN. No person will be admitted to competition for a Scholarship in a language which is his own mother tongue, nor for a Scholarship in a language allied to his mother tongue. The examination will take place early in July next. Full particulars may be obtained of the Secretary to the School, Imperial Institute. (For further information see page 104.)

IMPERIAL INSTITUTE JOURNAL.

An ornamental Cloth Cover, for binding the numbers of the JOURNAL for the year 1901 into one volume, may be obtained at the TICKET OFFICE of the INSTITUTE, or from Messrs. WATERLOW AND SONS LIMITED, Blomfield-house, London-wall, E.C., price 2s. 6d. An index and title-page to the volume were inserted in the January issue of the JOURNAL. Bound volumes of the JOURNAL for the seven years, 1895-1901, may be had at 10s. each.

SCIENTIFIC AND TECHNICAL DEPARTMENT.

The Scientific and Technical Department of the Institute has been established to acquire information by special enquiries and by experimental research, technical trials and commercial valuation regarding new or little known natural or manufactured products of the various Colonies and Dependencies of the British Empire and of foreign countries, and also regarding known products procurable from new sources, and local products of manufacture which it is desired to export. This work is carried out with a view to the creation of new openings in trade, or the promotion of industrial developments.

In the extensive and well-equipped series of Research Laboratories occupying the West Corridor of the Second Floor, a staff of skilled Chemists, under the direction of Professor Wyndham R. Dunstan, M.A., F.R.S., carry out the investigation of the chemical constitution and properties of new dye-stuffs, tanning materials, seeds and food-stuffs, oils, gums and resins, fibres, timbers, medicinal plants and products; animal products, minerals and ores, soils, cements, and various other products, with a view to their commercial utilization. Whenever necessary these materials are submitted to special scientific experts, by whom they are made the subjects of particular investigation or practical tests. Reports are also obtained from technical or trade-experts in regard to the probable commercial or industrial value of any such products, whilst full information is collected from official or other trustworthy sources regarding the probable extent and cost of available supplies. All materials requiring scientific or technical examination, or commercial valuation, should be submitted to the Institute for examination either by, or through, the Foreign Office, the Colonial Office, the India Office, or the Board of Trade, or through the Colonial or Indian Government Authorities. Requests for the examination of such materials may also be submitted by Public Commercial Bodies and Institutions of the respective Colonies and Dependencies, or by the Representatives of H.M. Government in foreign countries.

COMMERCIAL INTELLIGENCE DEPARTMENT.

The Office of this Department, in the West Corridor, First Floor, is open daily from 10 a.m. to 5 p.m. (on Saturdays till 1 p.m.), for the purpose of answering enquiries and supplying information relating to the Commerce (Export and Import) and Industries of India and the Colonies. Applications may be made personally or by letter. Special information may be obtained from the Curators in charge of the Indian and of certain Colonial Collections. Arrangements have been made for the translation for mercantile firms of Trade Circulars, Price-Lists, and Catalogues into any Foreign Language, including the conversion of weights, measures and coinages, etc., at cost price, and application for such may be addressed to this Department.

COMMERCIAL COLLECTIONS.

The Galleries containing the Colonial and Indian Collections, and the Public Commercial and Industrial News Room, are open for free inspection by the public daily, except Sundays, and any days specially notified, from 11 a.m. until 5 p.m. Every information concerning the products, their supply, etc., can be obtained on application to the Curators of the Indian and Ceylon, Canadian, and South African Sections, to the general Curator, and to the Commercial Intelligence Department.

CITY BRANCH OF THE IMPERIAL INSTITUTE.

The Reading Room and Enquiry Offices, open to annual subscribers of £1, and free to Fellows of the IMPERIAL INSTITUTE, will be removed, towards the end of the month, from 112, Cannon-street, to larger premises at 49, Eastcheap, where a commodious apartment will also be opened early in May for the display, to merchants, manufacturers, etc., of raw and manufactured products received, from time to time, from the Colonies and from India, and for which it is desired to find openings in the British markets. Curators and other members of the Imperial Institute staff will attend at the office at stated times and by special appointment, to deal with enquiries and to assist in establishing or facilitating business relations with mercantile houses, etc., in the Colonies and in India. The City Branch will be in constant communication, by telephone and messengers, with the Imperial Institute, South Kensington. (For further information see page 104.)

THE NORTHBROOK SOCIETY.

The Northbrook Society is affiliated to the Imperial Institute, and has a special room allotted for the exclusive use of its members in the Institute buildings. Its primary objects are to watch over and promote the interests of natives of India, and to provide a system of guardianship or supervision over such as are sent to Europe for education. The Society is controlled by a committee consisting of an equal number of Governors of the Imperial Institute and members of the Society, presided over by the Earl of Northbrook. It possesses an excellent library. Indian members, who pay no subscription to the Society, have the especial advantage of becoming Fellows of the Institute at half the usual subscription payable by the ordinary Fellows. Applications for membership of the Society should be addressed to the Secretary of the Northbrook Society, Imperial Institute, London, S.W.

"REQUIREMENTS" REGISTRY.

With the object of affording Fellows of the Imperial Institute, and the General Public resident in the United Kingdom, an opportunity of making known special "wants" or "needs" in the British Colonies, India, and Foreign Countries, space will be regularly devoted to approved notices in a column reserved for this purpose. Advertisers may have their replies addressed to them direct, c/o the Imperial Institute, London, S.W., under a distinctive number and initials. The cost of postage will be charged for the transmission of replies delivered at the Institute. Residents in the Colonies and India, and Foreign Countries, can register in like manner. (For further particulars see page 101.)

LIVERPOOL, ENGLAND.

FINANCIAL AND COMMERCIAL RETROSPECT.

UNITED KINGDOM.—The trade returns for February show increases in both the imports and exports compared with the same month of last year, though the re-exports of foreign and colonial merchandise, worth £5,804,101, were less by £162,187. As regards the imports, which were valued at £41,691,591, and thus showed an increase of £1,977,152 or 4·9 per cent., there were improvements in almost every class of goods except duty-free articles of food and drink, living animals, and chemicals. In the first-named class the decrease amounted to £604,579. Among cereals, barley alone was greater in quantity and value, which increased by 29 and 26·4 per cent. respectively. In wheat, owing to smaller shipments from Argentina, there was a decline of 9·3 per cent. in quantity and 11·6 per cent. in value. In wheat-flour, of which there was a diminished supply from the United States, the fall was 12·9 per cent. in quantity and 16·5 per cent. in value. Oats fell by 53·7 and 43·8 per cent. in the two respects, and Indian corn by 29·5 and 17·6 per cent., the United States sending over 3¼ million cwt. less. There was a large increase in rice—140·6 per cent. in amount and 102·5 per cent. in value. In sugar a big rise was recorded; the refined exactly doubled in weight and its value increased 27·3 per cent. to £1,304,060, while the quantity of the raw article rose by 58·7 per cent. and its value by 21·2 per cent. to £907,479. In raw materials for textile manufactures, larger shipments of cotton from the United States, Egypt and Brazil increased the weight by 33·9 per cent. to 492,473 cwt., the value, £4,722,358, being higher by 17·4 per cent. or £702,168. Cotton manufactures also increased in value by 22·2 per cent. to £489,204. Flax was less in quantity and value, hemp improved 13·9 per cent. in the former and 36·6 in the latter, jute was higher both in amount (36·3 per cent.) and value (24·3 per cent.), while in raw silk the rise in quantity was 173·3 per cent. and in value 147·1 per cent. Wool again showed considerable improvement—an increase of 15·9 per cent. in quantity and of 4·8 in value to £2,267,118; larger shipments arrived from South America, British South Africa, New Zealand, France and India, though Australia sent less. In the exports, which were worth £21,312,276, there was an increase of £274,821 or 1·3 per cent. The quantity of coal was greater by 9·1 per cent. (253,900 tons), but its value was less by 10·3 per cent. (£221,530). Iron and steel were better by 3·7 per cent. in quantity, but the value was fractionally less. In machinery there was a loss in value to the extent of 5·9 per cent.; new ships exhibited an improvement of £193,800. In yarns and textiles, cotton yarn increased 5·8 per cent. in quantity but fell off 9·1 in value, China taking more while Japan took much less. Cotton piece-goods were better by 13,262,300 yards (3·1 per cent.), but the value decreased by £29,070 or 0·6 per cent.; here, also, China was mainly responsible for the increased exports, the Indian demand being smaller. The quantity of wool increased by 122·4 per cent., but its value only about half that percentage. Woollen and worsted yarns were less in value by 9·1 per cent., though their quantity was higher by 2·5 per cent.; woollen and worsted tissues, however, were better in all respects, the former by 4·3 in quantity and 10 per cent. in value, and the latter by 17·2 and 18·4 per cent. In chemicals, all articles were higher, except sulphate of copper. Soda compounds increased 22·9 and 29·7 per cent. in quantity and value, while chemical manures were better by 27·6 and 34·3 per cent.

COLONIES.—In the course of his Budget speech the Treasurer of the Dominion of Canada estimated the revenue for the current year ending in June at \$56,800,000 or \$4,000,000 more than in last year. The total surplus he put at \$5,800,000. He spoke cheerfully of the future, and hoped for a broadening of the treaty with France, and a satisfactory treaty arrangement with Germany. In regard to the latter, he urged that it was a mistake to suppose that Canada had discriminated against her. Canada had indeed withdrawn some commercial privileges from Germany, but they were such as should only be granted to the family circle of the British Empire, and no foreign country should expect to enjoy them. Canada was quite ready to allow Germany as favourable treatment in her markets as was allowed to any other foreign country. This argument, it may be mentioned, is not accepted as convincing in Germany.

The increase in the Customs revenue of the Australian Federation for the current financial year is £578,000. New South Wales showed an increase of £351,859, Victoria of £14,000, South Australia of £18,000, Tasmania of £8,000, and Western Australia of £307,000. Queensland reported a decrease of £122,000. The reductions in the Tariff made by Parliament amount to £300,000, and the increases to £85,000. Queensland showing a decrease of £208,000 on the State Tariff of 1900, and Tasmania one of £110,000, the Government intend to adhere to the revenue duties proposed in the Tariff Bill—6s. per quintal on rice, 2d. a lb. on imported starch (besides an excise duty of 1d. per lb.), 3d. a lb. on tea, and 3d. a gallon on kerosine.

The gold yield of New South Wales in February was 10,952 oz. (scarcely more than half the amount in the same month last year), of Queensland 60,800 oz., of Western Australia 158,108 oz., and of New Zealand 41,632 oz.

According to the Natal Budget statement, the revenue of the colony for the past year was £683,000 above the estimate, and there was a surplus of £489,809 over the expenditure. The revenue for the current year is put at £3,400,000, and the surplus at £316,000. Customs are expected to show a large increase, but a diminution of £60,000 is expected in the railway receipts. The Budget statement of the Orange River Colony states that for the six months ending 31st December last, the total receipts were £131,000, and the expenditure £99,000. The surplus thus amounts to £32,000, although nothing has been received on account of railway profits, which in normal times vary from £400,000 to £500,000 a year. Among the items of the revenue are: Customs, £61,000; licences, £14,500; post-office, £12,000; dividends, £8,400; transfer duplicates, £1,000; agriculture, £14,600; and quit rents, £1,095. On the expenditure side, education cost £12,000; municipal police, £8,500; district administration, £7,800; prisons, £7,500; post office, £11,000; public works, £8,000; and agriculture, £3,000. In addition £400,000 has been spent on the refugee camps, including £30,000 on native camps, but the whole of this sum has been recovered from the army funds. The financial position of the colony is regarded as highly satisfactory, considering that many sources of revenue are at present locked up. For example, nothing is included in the Budget on account of claim-licences, which normally produce at least £8,000 a year, and quit-rents, which figure for only £1,095, in ordinary times yield something like £15,000 annually. The gold output of the Witwatersrand mines that have restarted crushing amounted in February to 81,405 oz. of fine gold; in January the amount was 70,340 oz. The Rhodesian mines yielded 13,204 oz. in February; this is in advance of the output (12,237 oz.) for February of last year, but considerably less than that for January last (15,954 oz.).

The Egyptian accounts for 1901 were closed at the beginning of last month. The revenue was £E12,160,000 against £E11,663,000 in the previous year, an increase of nearly £E500,000. The actual expenses incurred in 1901 were £E9,924,000, or £E24,000 more than in 1900. The balance of £E2,236,000 was distributed as follows: £E64,000 was paid into the Sinking Fund, £E265,000 into the Economies Fund, and £E1,143,000 to the General Reserve Fund controlled by the Caisse of the Public Debt. The residue, £E764,000, represents the surplus at the disposal of the Egyptian Government. Testimony is borne to the flourishing condition of Egypt's finances by the balances standing to the credit of the various reserve funds at the end of 1901; these were as follows: Economies Fund, £E4,491,000; General Reserve Fund, £E3,795,000; Special Reserve Fund, £E1,287,000. The total of these sums is £E9,573,000.

The following table shows the variations which have occurred in certain Colonial Government securities during the last three months:—

	28th Jan.	25th Feb.	26th Mar.
Canada 3 per cent. . . .	101¼-101¾	101-101½	101-101½
Cape 3 per cent. . . .	94-94½	96-96½	96½-97
Natal 3 per cent. . . .	93½-94½	93-94	93½-94½
New S. Wales 3 per cent. . .	95¼-96¼	96½-97	95-95½
New Zealand 3 per cent. . .	94½-95	95-95½	93½-94
Queensland, 3 per cent. . .	93¾-94¼	94¾-95¼	95-95½
South Australia 3 per cent. .	93-93½	93½-94	94-94½
Tasmania 3½ per cent. . .	103½-104½	103½-104½	103½-104½
Victoria 3 per cent. . . .	96½-97	96½-97	96½-97
West Australia 3 per cent. (May-Nov.)	92½-93½	93¼-93¾	93½-94½

INDIA.—The financial statement for the present year was made in the Legislative Council on March 19th. The accounts for 1900-1901 show an improvement in revenue over the revised estimate of £106,000. The gross railway receipts improved by £197,000, and the net railway profits were £325,000. An increase in revenue of £4,355,000 is shown by the revised estimate for 1901-1902, as compared with the estimate in last year's budget. The chief increases are under the following heads:—Land revenue, £299,000; opium, £311,000; stamps, £147,000; excise, £119,000; Customs, £644,000; mint, £515,000; railways, £1,750,000; military receipts, £115,000; other sources, £454,000. Under other heads there is a decrease of £2,000. The expenditure is less by £1,027,000. The heads under which reductions occur are direct demands on the revenue, £320,000; interest, £144,000; civil departments, £295,000; other public works, £417,000; army services, £1,006,000; and various minor groups, £131,000, the total being £2,213,000. On the other hand, there are increased expenses in connection with the mint, £431,000; with railways, £768,000; minor heads, £87,000; and provincial surpluses and deficits, £1,400,000. The net result is an increase of the surplus by £3,982,000 to £4,673,000. The Budget estimate for 1902-1903, as compared with the revised estimate for 1901-1902, shows the following decreases in revenue, amounting in all to £2,445,000:—Land revenue (explained by remission of arrears), £680,000; opium £625,000, owing to lower prices estimated for; Customs £232,000, a continuance of the abnormal importation not being expected; mint £482,000, no allowance made for coinage of new rupees; railways £229,000, the inflation of traffic not being expected to continue; and various minor decreases, £198,000. The increases amount to £269,000, made up of irrigation £121,000, and minor items £148,000. On the expenditure side there are the following increases:—Direct demands on revenue, £546,000; civil departments, £965,000, including law courts £118,000; police, £147,000; education, £358,000; medical, £157,000; political, £222,000; irrigation works,

£253,000, including special grant of £167,000 for minor irrigation works; railways £294,000, due to interest charges; other public works, £848,000; army services, £1,535,000, no allowance being made for continued absence of troops; minor increases, £231,000. These increases make up a total of £4,673,000. Against this sum must be set decreases of £388,000 on the mint and £40,000 interest, making the net increase in expenditure £4,244,000. There is, therefore, a surplus of £838,000, after taking into account a net decrease of £2,585,000 in provincial surpluses and deficits, as compared with the revised estimate. The estimated capital outlay of 9,809,000 is made up as follows:—Railways and irrigation works, £8,152,000; deposits and advances, £979,000; net advances by Imperial Government and provincial governments, £341,000; and payment of Council Bills, £16,837,000, against drawings by the Secretary of State, £16,500,000. On the capital receipt side appear the items:—Imperial surplus, £838,000; amount to be raised through railway companies for State railways £2,200,000, and to be raised and deposited by railway companies, £1,613,000; permanent debt increase £1,041,000, including £1,000,000 to be raised in India; addition to unfunded debt, £543,000; remittances, net, £562,000; reduction of combined cash balances in India and England, £3,011,000; closing balances on March 31st, 1903, in India £10,832,000, in England £4,051,000. The railway programme includes the expenditure of £3,672,000 on open lines, £2,432,000 on lines under construction, £832,000 on lines recently begun, and £398,000 on those to be begun during the next cold weather—total, £7,334,000. The special grants include £1,321,000 for the assistance of the agricultural classes and remission of arrears of land assessments, £738,000 being the immediate charge during the next financial year; £167,000 for minor irrigation works; £267,000 for education; £213,000 for public works; and £120,000 for sanitary and administrative provincial requirements. In all the above figures the pound sterling has been taken as equivalent to 15 rupees.

The variations which have occurred in the securities of certain Indian railway companies are shown in the following table:—

	29th Jan.	26th Feb.	27th Mar.
Bengal and North Western . . .	130-134	131-135	130-134

AGRICULTURAL RETROSPECT.

UNITED KINGDOM.—Substantial progress was made during March with spring work. Tillage operations were continued with but little interruption, and the seeding of spring corn was completed in good time. The growing crops made steady progress. A continued improvement was seen in the young wheat and also in winter barley, whilst pastures and grass lands had, by Easter, fully regained their verdure. The lambing season has so far proved a most favourable one, though there has been some difficulty as to keep. It is to be hoped, therefore, that there will be no recurrence of severe weather to check the spring forage crops.

A trustworthy guide to the scale-insects of this country has long been needed, and there has now appeared the first volume of Mr. Robert Newstead's *Monograph of the Coccidæ of the British Isles*, issued by the Ray Society. This volume deals only with the sub-family *Diaspine*; the remainder will occupy the second volume, together with a bibliography. The volume is valuable not only from the scientific standpoint, owing to its detailed discussion of individual species, but equally from the economic point of view on account of the eminently practicable methods which are described for the suppression of scale infestation. The chief natural enemies of scales are other insects and also birds. The story of the victory obtained by the fruit-growers of California over the fluted scale by the acclimatization from Australia of an insect—a ladybird—that preys upon it, has often been told. Of natural enemies of scale in this country the author directs special attention to the titmice, notably the blue tit, and he bases his evidence upon repeated examinations of the contents of the stomachs of these birds. The chief artificial methods of coping with scale-attack are fumigation with hydrocyanic acid gas and spraying with various insecticidal solutions, the modes of preparing which are described. Special methods are indicated for the suppression of root-feeding species.

COLONIES.—Under the presidency of Dr. Morris, the Imperial Commissioner of Agriculture, the fourth West Indian Agricultural Conference was held at BARBADOS on January 4 and 6 last. In his presidential address, Dr. Morris passed in review the various industries of the islands, from sugar to bee-keeping and onion-growing. With regard to the question of central factories, he expressed the hope that in some of the smaller sugar islands it had approached a stage when the details may be submitted to the consideration of the planting community. In Barbados the opinion is not unanimous that central factories would materially improve the condition of all classes of the community. It is only proposed to introduce factories gradually, but so long as nothing is done it is difficult to look forward with any degree of comfort to the future of the sugar industry of the island. Papers on various subjects were read and discussed, sugar, naturally, taking the foremost place. There were communications on sugar-cane experiments in Barbados, Antigua, St. Kitts, Trinidad, and British Guiana. In Guiana an important feature has been the trials of canes on an estate scale, in addition to the necessary small plots. Reliable facts have just been obtained with regard to many industrial questions which cannot be satisfactorily answered from small plot experiments alone. In a paper on the Jamaica sugar industry, it was stated that under specially favourable conditions, canes could be produced at six shillings per ton. At the Conference Dinner, Sir Frederic Hodgson, the Governor of Barbados, speaking of the sugar industry of that island, stated "while bounties affect us very considerably, yet apart from bounties a great deal could be done by ourselves in placing our industry in a better state. If we are to hold our own in the struggle for existence, it is absolutely necessary that we should have factories which are equipped with the latest machinery and all modern appliances." Mr. Sydney Olivier pointed out some important differences between Barbados and Jamaica. The former seems to be cultivated on a complete system, but "in Jamaica we have a large peasant population still widely maintaining an almost African system of agriculture. The African system is not to make two blades of grass grow where one grew before, but to cut down and destroy by burning large areas of forest growth to grow a few yams or tanniers, or a little ginger. We have to grapple with this primeval habit. We have to transform a system of wasteful agriculture into a modern system which must be productive of better results." It is fully realised by the officials of the Imperial Agricultural Department, that a strenuous attempt must be made to raise the general standard of intelligence amongst all classes: and it is in contemplation shortly to commence the publication of a fortnightly paper, the *Agricultural News*, containing hints and advice in regard to all points of interest in the islands.

Agriculturists in QUEENSLAND have entered upon the present year with hopeful prospects. According to the *Queensland Agricultural Journal*, the official organ of the State Department of Agriculture, the year 1902 has opened with great promise. The wheat harvest has been a record for Queensland. With reduced railway rates and fair prices for wheat and barley, with genial rains and absence of pests, the outlook for the year is full of hope. The yield of sugar has been most satisfactory, and the young cane gives evidence of vigorous growth, foreshadowing a large return by the end of the year. Fruit culture is extending in all parts of the State. Coffee- and rice-growing are making rapid strides in the North and South respectively, and in a very few years Queensland will be quite able to supply its own requirements of these two staples. Regret is expressed that cotton-growing should not again have been added to the industries of the State, as there seems to be no reason why this should not pay as well as wheat, maize, and other crops mainly cultivated by the farmers. If locally-grown cotton could be obtained in sufficient quantities to keep a mill going, an incentive would be provided to re-establish the manufacture of cotton goods in Ipswich. The dairy industry is expanding year by year, and is no longer conducted in the slipshod fashion that formerly prevailed. Factories and creameries have sprung up on all sides. Cold storage is provided on at least two of the coast steamers, and Queensland butter more than holds its own in the British markets, as is evidenced by a comparison of the product of Denmark and that of the Australian States. The opportunity afforded to intending settlers by the throwing open of the rich lands repurchased from the squatters has been so freely availed of that these lands, devoted not long since to the raising of sheep and cattle, now constitute the homes of hundreds of thriving farmers. There is, of course, the other side of the picture, sufficiently indicated in the following words:—"We would that we could congratulate the Western pastoralists on a final break-up of the disastrous drought which has wrought such dire ruin in many parts of Queensland. Unhappily, the wished-for consummation has not yet come to pass; and even when luxuriant grass and herbs once more cover the plains of the Warrego and elsewhere in the West, a long time must elapse before the flocks and herds are made up to their original numbers."

INDIA.—From the final general report on the cotton crop of India, issued at Calcutta by the Statistical Department, it appears that, although the crop has proved deficient in Bombay, Madras, and the Nizam's Territory, the production is so satisfactory in most other Provinces that the total is expected to be but little below an average, and is estimated at fully two million bales. The area planted with wheat in Bengal this year is estimated at only 1,404,700 acres, a total considerably below the normal area. It is explained that the falling off is due to the want of rain at sowing time. The Director of Land Records and Agriculture reports that

he is unable to estimate a higher out-turn than 75 per cent. of a normal crop, and even this will not be obtained unless there is rain to swell the grain.

FOREIGN COUNTRIES.—The complete returns of the foreign trade of the ARGENTINE REPUBLIC for 1901 are now available, and from them the following figures relating to the exports of the principal articles of agricultural production are taken. The corresponding totals for the two preceding years are added for comparison. The majority of the totals for 1901 will be found to exceed the corresponding ones for 1900, whereas the reverse is the case when the comparison is between 1900 and 1899.

AGRICULTURAL EXPORTS FROM ARGENTINA.

	1899. Head.	1900. Head.	1901. Head.
Live cattle . . .	312,150	150,550	119,189
Live sheep . . .	543,458	198,102	25,746
	Tons.	Tons.	Tons.
Frozen mutton . .	56,827	56,412	63,013
Frozen beef . . .	9,079	24,590	44,904
Jerked beef . . .	19,164	16,449	24,296
Wool	237,111	100,913	228,358
	Lb.	Lb.	Lb.
Butter	2,594,891	2,322,663	3,322,391
Cheese	18,161	1,883	2,968
	Tons.	Tons.	Tons.
Wheat	1,713,429	1,929,676	904,289
Maize	1,116,276	713,248	1,112,290
Linseed	217,713	223,257	338,828
Hay	105,598	102,836	95,120

A great shrinkage is seen in the exports of cattle and sheep. The closing of our ports against Argentine cattle and sheep during the whole of last year, and part of 1900, as a safeguard against foot-and-mouth disease has ruinously affected the trade in cattle, and brought the export of sheep from the River Plate almost to the verge of extinction, inasmuch as for every 20 sheep shipped alive in 1899 only one was so shipped in 1901. The enforced restriction in the shipment of live animals has, it will be seen from the figures, given an impetus to the frozen meat industry of the Argentine, the expansion of the frozen beef trade being greater than that of the frozen mutton trade. The export trade in butter is making steady progress. The shipment of 3,322,391 lb. in 1901, or 43 per cent. more than in 1900, is the largest yet recorded, and seems to indicate serious efforts on the part of the dairy farmers of the Plate Valley to compete with Australasia in supplying us with butter. The erratic nature of Argentina's supplies of wheat to the world's markets is illustrated in the circumstance that the exports of wheat in 1901, returned at 904,289 tons, were less than half of those in the preceding year. On the other hand, maize nearly recovered the level attained in 1899, and the exports of linseed, 338,828 tons in 1901, were 50 per cent. larger than in the previous year. The exports of hay (lucerne or *alfalfa*) have been slowly declining for several years.

An Insular Bureau of Agriculture has been established in the PHILIPPINE ISLANDS by the United States Government in order to remedy the deplorable condition of agriculture there, and Professor F. Lamson-Scribner, an accomplished botanist, who for nearly eight years has been agrostologist of the American Department of Agriculture, is appointed chief with headquarters at Manila. The current annual report of the American Secretary of War states, with reference to the Philippines, that "the methods of cultivation are primitive and ineffective; the ordinary vegetables, notwithstanding the fertility of the land, are small and poor, and the stock is evidently run out and should be renewed. Many grains which are unknown to the people can undoubtedly be raised. They live chiefly on rice, and raise less than they consume." The main object of the new bureau is "to promote the development of the agricultural resources of the archipelago," and it will take charge of and conduct the model farms and experiment stations which were established in a number of provinces under the Spanish *régime*. In view of the agricultural importance of the islands, and the great opportunities for development along many different lines, the field for research and economic work is considered to be exceedingly attractive, and it is anticipated that in course of time the bureau will develop into one of the strongest and most useful branches of the Insular Government.

The Railways of New South Wales.—The New South Wales Railway Commissioners recently submitted their report to the Minister for Railways for the quarter ended December 31. This quarter of the year is the summer season at the antipodes, and the principal portion of the wool is moving within that quarter from the inland districts to the seaboard, while grain is also carried to a considerable extent. The revenue for the three months was £1,071,789 and the expenditure £599,014, the former giving an increase of £19,390 and the latter of £65,207, so that the net revenue fell to the extent of £45,817. Various causes are put down as accounting for the reduction, principally the increased cost of material, higher wages to the staff, greater proportion of relaying and renewal work carried out, while the goods business suffered by reason of the reduction of rates which was made prior to the quarter, and which did not lead to a corresponding increase in business, and also by reason of the fact that there was a great proportion of low-freighted goods carried. The railway business is also said to have been affected by the fiscal question. New South Wales has to share the new tariff which came into operation on October 5, and no doubt in its incidence it has had a prejudicial effect upon the returns. In regard to the trams, the electric system continues to give the utmost satisfaction, and it is being extended.

A Motor Fishing Boat.—The first completely equipped motor fishing boat has just made her trial trip most satisfactorily at Lowestoft. There have previously been boats fitted with motors for propulsion merely, but this is the first fishing craft which will rely upon petrol to generate the force required for all purposes—hauling her nets, hoisting sails, working the capstan, and driving her pumps. The motor is of 24-h.p., and is fitted in a case 4 ft. by 2½ ft. It is only 3 ft. high, and the top cover serves for a table. The motor is of the three-cylinder, two-cycle type, and self-starting and reversing.

LABOUR RETROSPECT.

UNITED KINGDOM.—The *Labour Gazette* for March reported a slight improvement in the general state of employment. Compared with a year ago, a better tone prevails in the coal, iron and steel, and cotton industries, but the engineering, shipbuilding, building, and certain other groups of trades have not shared the betterment. On the Tyne and Wear, trade prospects are good, but at Liverpool and Birkenhead fresh orders are awaited with some anxiety. The Boiler Makers' and Iron and Steel Shipbuilders' Society, in their report, give some sensible and straightforward advice to their members. "During the extreme busy time of the past three years, some have grown careless, conducting themselves as if such a thing as bad trade was only an unpleasant dream and not a reality. The inclination to cease work without justifiable reason on the part of a few of our members has also had its ill-effect, and brings discredit upon us all when the Society's undertaking with the employers is that, pending the settlement of disputed jobs, work should be proceeded with. A pledge given should at all times be kept. A manly course should be adopted by a chance being given to your officials to settle."

The development which has recently taken place in the tin-plate trade is worthy of special mention. The *Labour Gazette* for March states that employment is good and much better than a year ago. At the end of February 386 mills were at work (including those engaged in the manufacture of black plates) compared with 278 a year ago. It is now reported from South Wales that there are but two works idle on the list, and that one of these, which possesses 8 or 10 mills, will be shortly restarted. All are fully booked for some months ahead.

In the recent discussions respecting trade unionism and its effect on the industries of this country, the question of the conditions prevailing in the building trade entered largely, it being stated that 400 bricks per day was as much as London builders could get out of their bricklayers. In this connection, Mr. J. C. Stewart, building manager of the British Westinghouse Electric and Manufacturing Company, has written a letter in the *Times* upon the work of bricklayers in the construction of the new building in Trafford Park, Manchester. In building the pattern shop the average performance per man per day was 1,800 bricks, and the average includes the facing work. On common work an average was reached of 2,250 bricks per man, per day. These, and similar results, were got out of English bricklayers, members of the union, directed by members of the union, and paid 11½d. per hour, or 1½d. more than the union rate. But these results are not attained without intelligence and liberality on the part of the employers. Facilities are provided for the rapid supply of bricks, and a soft mortar is used which spreads easily and allows the bricks to be imbedded with much greater ease than the stiff mortar used here. Mr. Stewart's experience is that if British workmen are to be successfully handled they must know that they are to get good wages, and the man who has charge of the work must know his business, and must have the work done in his own way, in his own time, and by his own methods. This does not only apply to bricklayers. Mr. Stewart gets his work done by British carpenters just as quickly and as cheaply as he has ever accomplished similar work in America. As he gets on with the workmen so he gets on with the unions. They do not seem to interfere with him or to want to take the management out of his hands. On the contrary, he acknowledges that his progress has been "greatly due to the interest that has been taken by the representatives of the unions in securing for him the best men that could be obtained." "What is Mr. Stewart's secret?" asks the *Times*. "Is it anything beyond the power of British masters to find out? We should say not."

COLONIES.—In the report of the Department of the Interior of CANADA, Mr. Smart says with regard to the important question of immigration, that the general result of the work for the past year has been satisfactory. There has been a substantial increase in the number of arrivals, and, according to the reports of the agents of the Department at the ports of landing and in the west, the class of settlers who have come to Canada with a view to settling on the vacant lands is a very desirable one. Although only a comparatively small proportion of the large influx of European emigration to America is directed towards Canada each year, there is no doubt that as a result of the careful selection exercised by the officers of the Department, Canada receives more than a fair proportion of the European agriculturists who arrive in America with sufficient means and experience at their disposal to locate on vacant Dominion or Crown lands and become self-supporting. As to the settlement of Manitoba and the North-West Territories only by the sons of Canadian farmers or by British settlers, Mr. Smart disapproves of the scheme. When the extent of the territory is taken into account, and also the proportion of the country which is being settled year by year, there need be little fear but that there will be plenty of land left for a number of generations of Canadians and British immigrants. The fact is that in a few years to come the various nationalities—Mennonites, Icelanders, Galicians, Doukhobors, Scandinavians, and Germans—will undoubtedly be lost in the great Canadian nationality. Over 55,000 United States settlers, with their families, settled in the North-West during the last five years, the accuracy of these figures

being fully borne out by the large percentage as shown by the returns of the persons from that country who have entered for free homesteads during that period. It is also highly satisfactory to know that the United States settler who crosses the boundary to permanently settle on Canadian soil soon becomes a fervent admirer of Canadian institutions, and fully appreciates the advantages the same offer. Commissions have been investigating the subject of Chinese and Japanese immigration into Canada, and their reports have now been made public. As was anticipated, it is recommended that the further immigration of Chinese labourers into Canada be prohibited, and a treaty is suggested to accomplish this end. In the meantime, it is proposed that the capitation tax be increased to \$500. The Commission on Japanese immigration is of opinion that if the Japanese Government puts in force its Inhibition Act, preventing emigration from Japan, this will meet all objections; if not, further legislative action by Canada will be needed, as it is held that the presence of Japanese immigrants is as detrimental to the best interests of the country as that of Chinese. Legislation on the lines of the Natal Act is suggested.

Regarding the immigration into NATAL, the Premier has announced that the Government is preparing a scheme for the settlement of suitable Europeans, and stated that he hoped the Legislative Assembly would pass a Bill this Session for the compulsory acquisition of land suitable for such a settlement. The strikes of carpenters and railway workmen continue at Durban. The railwaymen demand an increase of one shilling a day, which would involve an increased expenditure of £50,000 a year. The railway workmen agreed to return if arbitration were conceded, but the Government declined, refusing to be forced into this step. The native labour question on the Rand has taken an improved aspect, the arrangements for bringing up natives from the East Coast having worked uniformly well. During the past month they have been arriving at the rate of 1,000 a week, a good proportion coming from Northern Zoutpansberg, from which the mines drew a large supply in time past. The natives appear very willing, and prefer, it is stated, working in the mines at one shilling per diem to entering the service of the municipality at 1s. 8d. per day. The mining industry is now well on the way to its normal rate of production, but white labour is plentiful.

FOREIGN COUNTRIES.—In an exhaustive report on labour conditions in MEXICO, published by the Department of Labour at Washington, Dr. Weyl deals very thoroughly with the immigration question. Hitherto the total result of the attempt to promote immigration has been inconsiderable. No great movement of labour from Europe has taken place, and the agriculture, mining and other industries of the country have been compelled to rely practically upon the native labour force. The demand for labour, however, has rapidly increased with the activity in all branches of industry, and this demand for labour and the small result attained by attempting to stimulate the Indian to increased effort, have caused the need for immigration to become particularly acute and urgent. The problem of inducing immigration from Europe is one of the greatest difficulty. The would-be immigrant, unless he belongs to the class of skilled workmen, is confronted with the prospect of competition with a population with a lower standard of life than his own, and earning wages which (expressed in gold at least) are considerably below what he can earn in the home country. The wages paid to agricultural labourers in Mexico are not apt to be much of an incentive to the prospective immigrant from Germany or Italy. Mexico has a greater probability of obtaining immigrants from the latter country, however, than from any other European country. Italy, with its prolific population, is turning out immense numbers of emigrants, and is peopling, to a considerable extent, the available territory in Latin America, the bulk, at present, going to Argentina, which offers more attraction. Employers have turned their attention to China as a source for obtaining unskilled labour, but opinion is divided as to the advisability of this course of action. At all events, Asiatic immigration is more likely to occur than European. While, however, no great immigration of unskilled labour may be anticipated, it is probable that a certain number of foreign workers will always be in demand for the more skilled occupations. In the Republic there is quite a number of Americans, Spaniards, Frenchmen, Germans and Italians employed in occupations which require a certain degree of skill, and the demand for such labour as cannot well be done by Mexicans, while not great, is at all events intense. According to the reports of the Italian Minister in Mexico, the field for employment of comparatively cheap Italian labour is very good, especially if the persons who go there, whether agriculturists, horticulturists, miners, railway employees or persons engaged in trade, are good workmen and specialists. The field, however, is not entirely attractive, since the wages at start are not very high, and all reports agree that no one should be encouraged to go to Mexico unless he is satisfied to commence with a small salary, and endure discomforts, if not privations, to which he may not have been accustomed at home. There is demand, however, for mechanical operatives—blacksmiths, masons, stonecutters, electricians, and other persons engaged in skilled work of any sort. In concluding his report, Dr. Weyl states that, upon the whole, the most encouraging view of Mexican labour is to be obtained by considering not the actual conditions, but the probable effect of tendencies now at work. These tendencies appear to be almost entirely in the direction of an improvement in the conditions of the labouring population, and while the progress which has been made has been exaggerated by many writers, and while the real wages of the population have not increased as rapidly as many persons have stated, there can be no doubt that all the tendencies at work are favouring the growth of an independent and intelligent working class.

SCIENTIFIC AND TECHNICAL DEPARTMENT OF THE IMPERIAL INSTITUTE.

REPORT ON SPECIMENS OF FIVE KINDS OF WOOD FROM LAGOS.

(By MR. HERBERT STONE, F.L.S., F.R.C.I.)

The following report on specimens of Lagos woods has been received from MR. HERBERT STONE, one of the Imperial Institute expert referees on timbers:—

Through the kindness of the Governor of Lagos I have received specimens of five different kinds of wood from that neighbourhood, a few notes upon which may be of interest. The specimens were sent in response to a memorandum of mine which was transmitted to the Governor of Lagos by the Secretary of State for the Colonies whose support I was fortunate enough to secure. As the specimens were intended for a scientific purpose, *i.e.* the placing on record of the anatomical characters in order that the species may be identified when required, they are not of sufficient dimensions to permit of a thorough examination from a technical point of view, yet, as all but one are new to the English market, even the meagre information I am able to afford may be of service.

EKKI.—This is the well-known "African oak," a wood of great hardness and density, and of a deep red colour. The pores on a vertical section are filled with a white deposit which contrast sharply with the deep colour of the ground and on transverse section appear as scattered whitish dots; amongst these are great numbers of concentric rings of light-coloured tissue which make their appearance on the vertical section as fine loops and zigzag lines. It is a first-class heavy fancy wood and, as there is a market for it already, it may be sent here without risk.

IROKO.—This is possibly a species of *Psychotria*, to which genus the structure points. It is a brown wood, uniform in colour, being only relieved by the pores which appear hoary from their borders of lighter coloured soft tissue. It weighs 39½ lb. per cubic foot, is straight, coarse and open grained, and has a little lustre. It is easy to work, a trifle hard to saw and plane. The grain during planing picks up one way of the grain, but a smooth surface can readily be obtained the other. It will not take a good finish, owing to the unusual circumstance that ridges arise along the pores which become more prominent the longer the polishing is continued. Apart from merits which it may possess for structural purposes (of which the specimen is insufficient to permit one to judge), it may be said that this wood will meet with considerable difficulty in getting a footing on the English market, as there is little in its appearance to recommend it as a furniture wood.

OGANWO, and another unnamed species of mahogany closely allied to the Genus *Cedrela*. Both these are practically indistinguishable from Assinee or Axim mahogany and would readily be accepted here as "African mahogany." In both working and appearance they resemble that wood. The weight per cubic foot of Oganwo is 34½ lb., and that of the other 35 lb.; both are very deep in colour, their surface is lustrous and their pores are free from white deposit. They are two very excellent woods which should prove remunerative to import.

OPEPE is a curious wood, unlike any other, both as regards structure and appearance. It is of a beautiful gold colour, most agreeable to the eye; rather coarse and open grained, but extremely compact, dense and rather hard. Its surface has no lustre and feels smooth and rather cold as does boxwood. This compactness and smoothness makes it easy to polish to a fine finish; spirit polish does not spoil the colour. Weight 47½ lb. per cubic foot. I think it would meet with a welcome here, but there is not the same certainty as in the case of the foregoing species of mahogany; it depends so much upon taste. I think that it would eventually find a place after undergoing the same probation as other furniture woods having no striking merit, that is, to be imported for a time at a loss. Opepe is an excellent wood to work and leaves the tools quite smooth; even the saw leaves a clean surface, while it scarcely requires touching after the plane. It cuts and saws much more easily than its hardness would lead one to expect. I imagine that its breaking point would be low, as it appears to be short-grained and brittle.

THE ELECTRO-CHEMICAL AND ELECTRO-METALLURGICAL INDUSTRIES.

The extent to which electrical methods are at present being utilized in manufacturing operations has already been indicated in this JOURNAL (Vol. VII, p. 96), where a review of the most important electro-chemical and electro-metallurgical industries was given. The information contained therein may be supplemented by a few details concerning the progress made during 1901, the necessary data for which are furnished by Mr. J. B. C. Kershaw, in *The Electrician* (Vol. XLVIII, pp. 421, 462). Before dealing with the individual industries, it may be stated that last year's operations resulted in varying success in the different branches, for while the works producing aluminium, alkalies and bleach, sodium and sodium peroxide, and nickel all show slight increases in number and capacity, yet, on the other hand, the chlorate, copper, hypochlorite and zinc industries are all stationary, and for the moment their development appears to be checked. As anticipated in the previous article, the production of calcium carbide showed a marked decline owing to the heavy fall in price, which occurred through the supplies exceeding the demand, and many of the works formerly engaged in the industry have either been closed or are being devoted to the production of other high temperature products, such as ferro-chrome, ferro-silicon and similar alloys.

Aluminium.—The number of works producing this metal has been increased from eight to nine by the completion of the works at Shawinigan Falls, Canada. The latter, which has been erected by the Pittsburg Reduction Company of Niagara, possesses generating plant equal to 6,000 h.p. and is employing the Hall process, utilizing the Canadian deposits of corundum for raw material. The total production of aluminium during the year is a little uncertain, as the European manufacturers still refuse to furnish figures of their output, but it probably amounts to 7,500 tons. The selling price has remained practically unaltered in America during the year at about £150 per ton, but the British Aluminium Company have greatly reduced their price, and in November last quoted ingot metal of 98 to 99 per cent. aluminium at £130 per ton. No very striking development occurred in the utilization of aluminium, but the employment of the metal and its alloys is steadily growing. The recent fall in the price of copper, if permanent, will, however, probably check the use of aluminium for electrical transmission, since, if the cost of the two metals is about the same, copper will be generally preferred. The use of aluminium in foundry work still remains one of the most important of its applications, while plates of the metal are being largely employed in place of stone for lithographic purposes in Germany and America, and there is an increasing demand for the alloys for motor-car construction. It may be noted that the Goldschmidt method of producing high temperatures for welding, by means of a mixture of aluminium and ferric oxide, (IMP. INST. JOURN., Vol. VI., p. 293), has undergone further improvement and is now available for repairing broken propeller shafts in mid-ocean, an application which will probably prove of considerable importance. The most important of the new patents relating to the manufacture of aluminium are (1) a new method, introduced by Hall, of preparing the raw bauxite for the electrolytic bath, and (2) an electrolytic method of purifying the crude metal. The application of the British Aluminium Company for an extension of the life of the British Héroult patent has been refused, and their monopoly of production will therefore cease during the present year.

Copper.—The heavy fall in the price of copper which occurred during the year, owing to the collapse of the American syndicate, had the effect of diminishing the output, and, in consequence, the amount of the metal electrolytically refined will show a slight decrease from that of the previous year, when 210,000 tons, or 44 per cent. of the total, were thus treated. There were 37 refineries in operation during the year as against 42 in 1900. The works at Papenburg, in Germany, and in New Jersey, U.S.A., where copper is being extracted electrolytically direct from the ores, are still in operation, but the success of the processes is not yet fully established.

Nickel.—Considerable development has taken place during the year in connection with the nickel industry in the Sudbury district of Canada, where three mining companies are now at work. Of these the Canadian Copper Company and the Mond Nickel Company ship the concentrated matte to New Jersey and Swansea respectively, and in the latter case works have been erected at Clydach for the extraction of the metal by the Mond process. The Lake Superior Power Company are, however, treating the ore on the spot, and large works have been erected at Sault Sainte Marie, where the Clergue process of manufacturing ferro-nickel alloys direct from the ores by means of an electric furnace will be tried. In connection with this a nickel steel rail and plate mill is also being built for an output of 1,000 tons per day. In 1900 the Sudbury district produced ores containing 3,212 tons of nickel, but during last year the output of 3 per cent. ore was 700 tons per day, equal to a total of 6,000 tons of nickel. The Frasch nickel process is still undergoing trial at Hamilton, Ontario, but no information has been published concerning the progress made during the year. The only new development in connection with the working of the nickel ore of New Caledonia has been the erection of smelting and refining works at Newcastle, New South Wales, and in the latter colony itself extensive beds of ore are said to have been discovered.

Zinc.—There is very little to be recorded concerning the electrolytic zinc industry during 1901, as the fall in price of all the metals usually associated with zinc in its ores has checked development. The Hoepfner process is still in successful operation at Winnington, in Cheshire, and the method of Swinburne and Ashcroft is now to be tried upon a manufacturing scale at Weston Point. A new method of treating zinc ores is reported from Italy, by which the metal is volatilised by smelting in an electric furnace, the yield being given as 1 kilogram of zinc per 2 E.H.P. hours.

Calcium Carbide.—During 1900 there were over 100 carbide works in existence, but, as already stated, the large over-production has resulted in many of these being closed or devoted to other purposes. On the Continent, however, the price of carbide has continued low—at a little above £10 per ton, so that the accumulated stocks have not yet been disposed of—but the Acetylene Illuminating Company, who control the English market, still quote £19 per ton for delivery in the United Kingdom. The low price of carbide has given a considerable impetus to the acetylene gas industry and the number of lighting stations for small towns and villages is steadily increasing, both here and on the Continent. Another application to which calcium carbide has been put is as a germicide in the vineyards of Italy and France, where tests extending over three years are said to have proved its value for combating phylloxera. Carbide dust, which is sold at 10 f. per 100 kg., is used for the purpose, and that prepared from lime containing a high percentage of phosphates is found to be most effective, since it gives off a greater quantity of phosphoretted hydrogen on exposure, and the latter appears to be the real germicide.

Chemical Products.—The works engaged in the production of alkalis and bleach were increased by one during the year, now numbering 31, and in several cases extensions were made. The Castner-Kellner mercury process and the secret process of the "Electron" Company appear to be the most successful methods in operation on a large scale and, together, produce two-thirds of the total output of electrolytic soda. A new method known as the "gravity" or "bell" process is, however, being tried in Germany and Austria and, up to the present, has given very promising results. It is said to be a simple process in which diaphragms are entirely done away with and a current efficiency of 86 per cent. is obtained in the cells. The production of chlorates by electrical processes has not showed much development, as the low prices which now obtain (3½d. per lb. for potassium chlorate and 3¼d. per lb. for sodium chlorate) have made the manufacture much less remunerative than formerly. The number of works remained stationary at eleven, and the output is estimated at 9,000 tons. There is little to be recorded concerning the production of hypochlorites and bleaching solutions by electrolysis. Such processes are almost entirely confined to Germany and Austria, and the trials which were being made at Bradford, with a view to the introduction of the method here, have been abandoned.

Miscellaneous Products.—Some of the other products obtained electrolytically are of growing importance, and are worthy of mention. Carborundum and artificial graphite are being produced in increasing quantities; the manufacture of compressed oxygen and hydrogen for industrial purposes by the electrolysis of water is also being taken up, and at present ten such installations are successfully at work. The Groth system of electrolytic tanning is in operation at Wem, in Shropshire, and at Wenersborg, in Sweden, while other large tanneries are about to give it a trial. The electrolytic methods of refining silver and parting gold are now being used in many bullion refineries. The new methods of manufacturing sodium and sodium peroxide have almost completely superseded the older processes, and magnesium is now being produced in a similar way; and, finally, the electric furnace is constantly receiving further practical applications.

THE MINERAL PRODUCTION OF THE BRITISH EMPIRE.

The concluding section of the Report on Mines and Quarries (Part IV.—Colonial and Foreign Statistics) for the year 1900, which has just been issued from the Home Office, gives a general survey of the mining industries of the world and permits us to compare the mineral production of the British Empire with that of foreign countries. The similar report of the previous year was also summarised in this JOURNAL (Vol. VII., p. 68), and the account there given may be referred to for purposes of comparison.

In the United Kingdom itself there were 4,148 mines in operation during 1900, finding employment for 814,517 persons, an increase of 138 mines and 50,351 persons employed, over the figures of the previous year; the number of quarries under official inspection, *i.e.*, those more than 20 feet deep, was 6,959, employing a total of 93,895 persons, a decrease of 35 quarries and 4,100 persons employed from the figures of 1899. The death rate through accidents at all the mines was 1·29 per 1,000 compared with 1·27 per 1,000 for each of the two previous years, while that in the quarries was 1·39 per 1,000 against 1·19 and 1·00 for the two preceding years. The total value of all the minerals obtained from the workings is estimated at £135,957,676, while the value of the metals obtainable by smelting from the ores raised is given as £21,030,719, compared with £97,470,296 and £18,314,750 in 1899, or £77,415,063 and £13,717,512 in 1898. The large increase in the value of the minerals raised during 1900 over that of the previous year was principally due to the higher price of coal, for while the output of this was increased by a little over five million tons the value rose no less than £38,171,469. The exports were, however, in no way checked by the rise in price and amounted to 44,089,197 tons, exclusive of two million tons of coke and patent fuel, being an increase of nearly three million tons over the previous year. Compared with coal, which now represents 89 per cent. of the total value of all the minerals raised, the other mining industries are of little importance. It may be noted, however, that the production of iron ore in 1900 shows a slight decrease in quantity, but an increase in value, while the out-

put of gold from Wales has risen from 3,327 oz., valued at £12,086, in 1899 to 14,004 oz., valued at £52,147, in 1900.

The contributions of the various parts of the British Empire to the world's production of coal and the most important metals during 1900 are shown in the following table, the quantities being given in kilograms and metric tons for comparison with the world's output, but it must be borne in mind that the figures do not represent the amount of the different metals actually produced in each country, but the amount represented by the ore mined in that country.

	Fine Gold.	Fine Silver.	Coal.	Iron.	Copper.	Lead.	Tin.	Zinc.

* Exclusive of the Transvaal.

Gold.—The gold production of the British Empire is now very much larger than that of any other country, amounting to nearly one-half of the total, and it will probably increase. Excluding the Transvaal, which appears in the table for the first time, and the figures for which give the output from November, 1899 to May, 1900, the production of gold during 1900 was 3,500 kilos. greater than in the previous year. The most notable increases are those of Canada, from 31,670 to 41,700 kilos., and of India, from 12,616 to 13,852 kilos., while, on the other hand, the total output from the Australian colonies diminished, the largest decrease being in New South Wales, from 12,827 to 8,746 kilos.

The large increase in the Canadian production is chiefly due to the working of the Klondike goldfields, the output from which rose by 303,580 oz. to a total of 1,077,649 oz., or more than four-fifths of the output of the Dominion. British Columbia also shows a substantial increase, yielding 231,089 oz., and the production in Nova Scotia is also higher. There is also reason to believe that gold-mining will become an important industry in Ontario, though at the present time the production is not very large. During 1900 Canada occupied the second place among the gold-producing colonies, its output being only 1,529 kilos. below that of Western Australia, and the importance of the industry is indicated by the fact that gold represented 43·8 per cent. of the total value of the entire mineral production. In India gold-mining is almost confined to the mines in Mysore, the amount obtained elsewhere being insignificant, and the value of the output is nearly double that of the coal. Of the Australian colonies Western Australia is still the largest producer, but the remarkable increase which has occurred during the two previous years has been checked, and the returns show a decrease of 3·8 per cent. in the output. As some of the newer fields are increasing their returns, however, it is hoped that the diminution is only temporary. The East Coolgardie field produced 737,971 oz., or nearly half the total; the Mount Margaret field 145,689 oz., and the Murchison, North Coolgardie and Coolgardie fields each produced rather more than 100,000 oz. Victoria occupies the second place among the Australasian colonies, for although its output of bar gold was less than that of Queensland, the latter has a lower degree of fineness and represents a smaller amount of fine gold. The most important Queensland field is that of Charters Towers, producing nearly half the total output, but the metal obtained here is of poor quality, only averaging 62 per cent. of fine gold, whereas the Mount Morgan field, which comes next in importance, yields a far purer gold. The returns of the other colonies call for no special notice, but it may be mentioned that the method of dredging river-beds for gold, which has been so successfully employed in New Zealand, is now to be tried in several other places. In New Zealand at the end of March 1901, there were 145 of these dredges at work, and 122 under construction; at the end of 1900 there were 22 dredging plants in operation in New South Wales, and the method is being applied in British Guiana, British New Guinea and in Canada. Outside the British Empire the chief gold-producing country is the United States, with an output of 119,913 kilos., leaving 84,792 kilos. as the production of the rest of the world.

Silver.—The production of silver in British possessions has diminished by 38,000 kilos. during the year, and now only forms one-tenth of the world's total. Canada and Tasmania have increased their output, the former to a large extent, but there has been a large decrease in the production of New South Wales which has more than counterbalanced the other gains. Mexico and the United States are the largest producers of silver, the outputs being 1,923,331 and 1,862,829 kilos. respectively, or together nearly two-thirds of the world's total.

Coal.—The British Empire as a whole still produces more coal than any other single country, although the United Kingdom itself now occupies second place to the United States. During the year under review the total British output was 247,938,725 metric tons, nearly one-third of the whole, but of this the colonies only contributed 19,143,806 tons. The total increase over the previous year was 7,943,577 tons, of which however the colonial share was 2,775,432 tons, representing an increase in their production of nearly 17 per cent. during the year. India, New South Wales, Canada and New Zealand are the largest contributors, together producing more than 17,700,000 tons. The output of India is increasing rapidly and now stands at 6,216,882 metric tons, of which about three-fourths are mined in Bengal. The imports of coal, chiefly British, only amount to 333,000 tons annually, so that the production is nearly sufficient to supply the wants of the country. The other three colonies also show substantial increases in their coal production; New South Wales possesses the most important Australian coalfields, and its output is over five-and-a-half million tons; in Canada the most important fields are situated in Nova Scotia and British Columbia, which produce about 64 and 29 per cent. respectively of the Dominion's output, while in New Zealand, where 167 collieries were at work in 1900, the largest mines are near Westport on the west coast of Middle Island. The amount of coal obtained in the other colonies is

small, and the only feature of note is the fact that Western Australia has more than doubled its output since the previous year. This was due to the opening up of the Collie coalfield, where three collieries are now at work. Of foreign countries the largest coal producers are the United States and Germany, which furnish 244,901,839 and 149,788,256 metric tons respectively.

Iron.—The amount of iron ore obtained in the colonies is small and the total shows a decrease, owing to a diminution in the home production. Out of a total of 4,987,641 metric tons the colonies only supplied 245,806 tons, this being a slight increase on their contribution of the previous year. The output from Newfoundland showed a considerable increase, but that from Canada was much less than in 1899. The countries producing more iron than the United Kingdom are the United States and Spain, their outputs being 14,014,475 and 5,626,410 metric tons respectively.

Copper.—The British Empire does not produce a large quantity of copper, its output being only one-thirteenth of the total, but the amount was considerably increased during 1900, owing probably to the high price of the metal. The quantity rose from 34,507 metric tons in 1899, to 41,456 tons in 1900, and for this increase Canada and Tasmania were chiefly responsible. In the latter colony the most important source of copper ore is the Mount Lyell Mine on the west coast, and the output increased from 6,157 metric tons in 1899 to 9,766 tons in 1900. The United States is by far the largest producer of copper, yielding 275,000 metric tons in 1900.

Lead.—The amount of this metal supplied by British Possessions was increased in 1900 by over 20,000 metric tons, owing to a large increase in the Canadian production, and formed a little less than one-tenth of the world's supply. Great Britain also supplied 24,755 metric tons, and the other chief contributor is Tasmania with an output of 13,347 tons. The world's chief producers are the United States, Spain and Germany, with outputs of 245,757, 203,744 and 121,513 metric tons respectively.

Tin.—Of this metal the British Empire contributed more than five-eighths of the world's supply, the chief source of ore being the Federated Malay States, which supplied 43,123 metric tons of tin out of a world's total of 80,643 metric tons. The greater part of the ore raised there is treated at Singapore, which has now the largest tin-smelting works in the world. Great Britain produces more than any of the other colonies and the Tasmanian output has slightly declined. Of foreign countries the chief producers of tin are the Dutch East Indies, Bolivia and Siam.

Zinc.—The production of this metal in the British Empire underwent a decrease of nearly 50 per cent. during the year under review, owing to a drop in the output of New South Wales from 16,272 metric tons in 1899, to 4,100 tons in 1900. Great Britain itself produced 9,211 tons, but the supplies obtained from the other colonies are insignificant. The world's chief producers are Germany and the United States, with outputs of 153,350 and 112,419 metric tons respectively.

ALUMINIUM AND ITS ALLOYS.

The production of pure aluminium upon a commercial scale has opened a wide field for investigation, since not only the metal itself but also its alloys possess properties which render them of great value for many purposes. The metal gives rise to an enormous number of alloys, some of which, containing one or two per cent. of other metals, combine the lightness of aluminium with greater hardness and strength, while, on the other hand, many metals are greatly improved for certain purposes by the addition of from one to ten per cent. of aluminium. The former may be classed as light aluminium alloys; the latter as heavy aluminium alloys. At the present time the metal and some of its light alloys are being largely used, instead of copper, as electric conductors for long distance transmission; and consequently the determination of the tensile properties, the change in length due to differences of temperature and the electrical conductivity of these was of considerable importance, especially as the addition to aluminium of copper, zinc, nickel and iron, in quantities up to two per cent., increases the tensile strength at the expense of the conductivity. Prof. E. Wilson, M.I.E.E., of King's College, London, has carried out such an investigation on 24 light aluminium alloys and gave an account of his results, some of which had already been published, at a recent meeting of the Society of Arts (*Journ. Soc. Arts*, Vol. L, p. 54).

The purest commercial aluminium contains about 99.5 per cent. of the metal, the remainder consisting of iron and silicon, and its specific gravity at 15° C. varies from 2.56, when cast in sand, to 2.71 when hammered or drawn. Its colour is found to vary with the method of casting; if cast in chill moulds and cooled quickly or in green sand at a low temperature the metal has a bright white colour nearly like that of silver, but if cast too hot in dry sand the colour is grey, like lead, or bluish like zinc. It can be melted in plumbago or sand crucibles without becoming brittle or taking up silicon, provided the temperature does not greatly exceed its melting point, 626° C., and when used for castings the shrinkage is 0.2 in. to the foot, as compared with 0.187 in. for copper. The annealing must be done in a closed muffle, as it is very essential that the metal should not come in contact with the open fire. The hardness depends upon the purity, the purest metal being the softest, and ordinary 98 per cent. aluminium about as hard as copper, but may be increased by working.

The results of the tests are summarised in the following table, so that the influence of the different metals added can be easily seen, while the corresponding figures for hard-drawn copper are added for comparison. The breaking load and limit of elasticity were in each case determined with wire of .126 in. diameter.

—	Composition.	Specific resistance in legal ohms at 15° C.	Temperature coefficient.	Co-efficient of linear expansion between 16° & 100° C.	Breaking load in lb. per sq. in.	Limit of elasticity in lb. per sq. in.
Copper . . .	—	1.695 × 10 ⁻⁶	—	.000017	62,700	27,000 ¹
Aluminium . .	{ Containing .31 p.c. iron & .14 p.c. silicon }	2.762 × 10 ⁻⁶	.00393	.000023	28,200	19,376 ²
ALLOYS.—						
Copper . . .	1.5 to 2 p.c. of copper	3.3 × 10 ⁻⁶	.0030	.000024	40,000	33,000 ³
Nickel . . .	2.2 p.c. of nickel .	—	—	—	38,600	20,300
Nickel-Copper .	{ 1.29 p.c. nickel & 1.08 p.c. copper }	3.41 × 10 ⁻⁶	.00178	.0000252	45,900	36,600 ⁴
Nickel-Iron . .	{ 1.39 p.c. nickel & 2.6 p.c. iron . . }	3.24 × 10 ⁻⁶	.0032	.0000222	42,200	24,400
Nickel-Zinc . .	{ .83 p.c. nickel & .9 p.c. zinc . . }	3.03 × 10 ⁻⁶	—	—	—	— ⁵
Iron-Manganese	{ .56 p.c. iron & 1.78 p.c. manganese . }	—	—	—	35,300	24,400 ⁶

¹ Percentage extension of .10 with 7.2 tons applied per sq. in.
² Percentage extension of .19 with 7.2 tons applied per sq. in.
³ Little is gained in tensile strength by increasing the copper from 1.5 to 2.5 per cent.
⁴ Percentage extension of .146 with 7.2 tons applied per sq. in.
⁵ Five of these alloys were tested; the maximum breaking load was 36,000 lb., and the limit of elasticity remained low.
⁶ Specific resistance was high.

In addition to the above some zinc and copper-zinc alloys were also tested. In the zinc alloys the conductivity was greater than in those containing copper in the same proportion, and the co-efficient of expansion fell slightly with increase of zinc, whereas it rose with increase of copper; the alloy containing 2 per cent. of zinc has a lower conductivity than that containing only 1.2 per cent. The two copper-zinc alloys examined did not exhibit any noteworthy properties.

With reference to the use of aluminium for electric transmission it will be seen from the above figures that, as the specific gravity of copper is 3.37 times that of aluminium, the conductivity of equal weights of aluminium and copper is as 2 to 1, or for equal conductivity half the weight of the former would be required. The ratio of the diameters of an aluminium and a copper wire of the same total conductivity is as 1.27 to 1, or of the cross-sectional area as 1.61 to 1, and at recent prices the cost is slightly in favour of aluminium, besides which the reduction in weight involves a great saving in transport and for overhead wires fewer and lighter poles are required. When aluminium was first utilized as an overhead conductor some difficulty was experienced in several places owing to excessive breakages, but with improvements in manufacture this appears to have been entirely done away with and the most recently erected lines have successfully withstood very severe storms. As far as the effects due to gravity and temperature are concerned, aluminium is just as advantageous as copper, since its lightness and greater percentage extension counterbalance the effect of its greater linear expansion, and, in fact, with regard to the elastic limit the factor of safety is greater than in copper under the same conditions. For small single wires where great tensile strength is needed the nickel-copper alloys, which have a limit of elasticity exceeding that of copper, might be employed with advantage, though the conductivity is lower than that of pure aluminium, but for large, single- or stranded conductors the latter should prove sufficiently strong. Whether overhead aluminium wires are liable to corrosion on exposure is a matter of great importance, and careful observations are being made at many places in order to decide this. Professor Wilson exhibited a specimen which had been in use for four years at Foyers and was very little affected, but, on the other hand, some experiments made by Mr. Kershaw (*IMP. INST. JOURN.*, Vol. VII., p. 41) appear to show that the air of manufacturing towns has a much greater influence. Up to the present, however, no serious action has been observed on any of the established lines.

The employment of aluminium has in the past presented one great drawback, viz., the difficulty of soldering it, and many methods have been introduced for overcoming this, such as the use of a sleeve-joint for wires, a method of electric welding, and the Cowper-Coles process, of which details have not been given. The difficulty appears to be chiefly due to the slight film of oxide which forms upon the surface of the metal on exposure to air, and which must be broken up by scratching with a wire brush, while the surface is covered with the molten solder. If this procedure is followed the operation becomes quite easy with a solder of the following composition:—28 parts of block tin, 14 of phosphor-tin (10 per cent. phosphorus) 3.5 of lead, and 7 of spelter.

The chief heavy aluminium alloys at present in use are the aluminium bronzes, which usually contain from 8 to 12 per cent. of aluminium and 92 to 88 per cent. of copper. These possess a golden colour, are non-corrodible, and as strong as steel, being extensively employed for propeller blades, rudder frames and in hydraulic work. The breaking load varies from 34 to 44 tons per square inch, according to the composition of the alloy, and they have a high elastic limit and transverse strength. For forgings or stampings four classes of bronze are recommended, containing respectively 10, 7.5, 5, and 2.5 per cent. of aluminium (the rest being copper); the specific gravity of these varies from 7.6 to 8.3, and the tensile strength from 30 to 20 tons per square inch.

THE WORK OF THE GERMAN COLONIAL ECONOMIC INSTITUTE.

The colonies and dependencies belonging to the German Empire, although comparatively insignificant in total area and possessing at present but a small volume of trade, bid fair in the future to become important commercial centres, owing to the care with which their resources are being surveyed with a view to ultimate utilization to the greatest advantage of the colonies concerned. It will be sufficient in this connection to mention the systematic mineralogical and botanical surveys now being made in German West and East Africa, and the establishment in the latter colony of a State Department charged with the thorough investigation of new natural products of all kinds and the determination of their exact commercial value.

This anxiety to develop commercial relations with the colonies is not, however, confined to the German Government, as is shown by the formation a few years ago of the Kolonial-Wirtschaftliches Komitee of Berlin, on the initiative of a number of gentlemen connected with academic institutions in Germany. This body, which receives no financial help from the Government, carries out in Germany work similar to that of the Scientific and Technical Department of the Imperial Institute and of Kew Gardens, but of course on a very much smaller scale.

Its work is organised by an elected executive council, and the funds are provided by subscriptions from members who, in return, have the privilege of attending certain meetings and of receiving free the official publications of the society.

An idea of the work carried out by this body may perhaps best be obtained from the yearly report issued for 1900-1901. This commences with a concise statement of colonial development during the year, giving particulars regarding new companies formed for the exploitation of colonial products, dividends paid by companies already at work, and other similar matter.

The society employs a chemist and a botanist who examine and report upon products submitted by colonial correspondents. Among the materials so examined during last year may be mentioned rubber derived from a species of *Ficus* occurring in the Cameroons, gums from German W. Africa, which were found to be excellent substitutes for Soudanese gum, various gutta-perchas collected in S. America, tobacco cultivated in the Cameroon district, and maize and potatoes from German South-West Africa. In addition a number of substances were submitted to commercial experts, such as divi-divi pods from S.W. Africa, which were valued at 10s. per cwt., 'kapok' a fibre derived from *Calotropis procera* (this material has already been investigated in the Scientific Department of the Imperial Institute), the gums already referred to, which do not appear to have greatly impressed the experts to whom they were sent, a specimen of Manila hemp from Ponape, sisal hemp from New Guinea and ramie fibre from the Cameroons.

The chemical investigations so far undertaken appear to be of a very superficial nature, and comparatively few substances of unknown character are submitted for examination, a condition which is perhaps due to the fact that the German colonies are of recent acquisition, and attention is at present being devoted rather to products already well known than to materials for which some application may eventually be found. The work, therefore, differs somewhat in character from that of the Scientific Department of the Imperial Institute, where in addition to the examination of commercial products such as those mentioned above, which is constantly going on, investigations into more difficult subjects such as the invention of processes for the utilization of tan-stuffs, resins and gums which in their natural conditions present some objectional features from a manufacturer's or consumer's point of view, have

also to be undertaken. These often involve a determination of the chemical constitution of the substances present in the materials, from which definite and reliable results can only be slowly accumulated.

The botanical work done by the society consists in the importation of seeds and cuttings of plants likely to furnish useful products, into the colonies. A complete list showing the importations of such materials during the past year is given in the report already referred to, with the name of the country of origin and their destinations. Central and South America appear to have been largely laid under contribution last year, and among the better known plants obtained thence may be mentioned several gum-yielding species of *Acacia*, *Caesalpinias*, the fruits of which are used as tanning materials, *Capsicum annuum* from which chillies are obtained, quebracho, orange, chayote, pomegranate, as well as several rubber and gutta-percha plants. From India were obtained seeds of *Acacia catechu*, which yields the black catechu of commerce, *Acacia glauca* and *Modesia* which furnish gums of the Arabic type, *Albizia lebbek*, *Tectona grandis* (teak), *Casuarina species* and other valuable timber trees. A considerable number of medicinal plants, such as the castor oil, camphor, coca (yielding the valuable alkaloid cocaine), cinchona, curcuma (turmeric), cassia and tamarind, were also secured in India and Burma.

This branch of the Society's work is identical with part of that carried on in the British Empire by Kew Gardens and the various botanical gardens in the colonies affiliated to the former and in constant communication with it.

This work of the German Institute is organised almost on the same lines as those on which it is conducted in this country, but in the branch to which it devotes most attention there appears to be no counterpart in Great Britain, viz., in the equipment of expeditions to explore colonies for new products. Such work is done in this country by private firms for the articles in which they are interested, and the Foreign Office reports from certain countries occasionally chronicle the arrival of an expert sent by some enterprising firm to study the local supplies of certain materials. It is probable, however, that much help could be given to small manufacturers in this country if exact information on sources of supply were secured in this way by experts whose reports would be available for general use.

Several of these expeditions are organised by the German Society every year; thus, last year, a botanist spent two months in German S.W. Africa investigating the best methods of cultivating and preparing rubber obtained from the roots of certain trees, whilst a second expert explored the central portion of German East Africa for gum-yielding plants, fibres, tanning materials, and medicinal plants, especially strophanthus, and at the present time Dr. Stuhlman, director of Agriculture in this colony, is in India studying the cultivation of teak, cinchona, and sun hemp.

Similar expeditions are at present investigating the cultivation of cotton in the chief cotton-yielding districts of the world, with a view to the extensive cultivation of this staple in Togoland; and another left Germany in December, 1900, to study the cultivation of gutta-percha, rubber, sago, gambier, tapioca, etc., in the South Seas, and especially in Singapore and Malacca.

Full reports of several of the expeditions undertaken in former years have been published, such as that of Dr. Preuss to Central and South America, which resulted in the rich collection of seeds of economic plants, of which mention has already been made, and that of Mr. Schlechter, when the rubber-yielding plants of W. Africa were studied.

The collections made by the various expeditions are exhibited usually in Berlin, and are finally deposited with the Colonial Museum, although small collections of typical products are freely sent to schools and colleges for the instruction of students.

The results of the chemical, botanical, and other investigations are printed in the official journal, *Der Tropenpflanzer*, which appears monthly, and consists usually of about thirty octavo pages, and contains, in addition to the above matters, special articles on the German colonies, their management, and utilization, together with notes of progress. The current prices of most natural products at Hamburg are also given, though the value of such information is rather problematical, since prices a month old are of little use to dealers.

Supplements to this paper also occasionally appear dealing with specially interesting topics; for example, the supplement for January of this year, contains an excellent account of the climate, government and natural resources of Anatolia, the country through which the German railway, described in Turkish official circles as the *Chemin de Fer Ottoman d'Anatolie*, will run, and provides intending settlers with full information regarding the district.

An "address book" giving the addresses of German dealers in natural products in all parts of the world, is also published, and contains, in addition, particulars of the best routes to the colonies and freight rates, as far as these can be known, of most shipping companies.

Readers who are conversant with the work of the various departments of the Imperial Institute will see that the organisation of the German Society is planned on the same lines, the modifications introduced being such as are necessary in the cases of colonies whose resources are not so well explored as those of Great Britain.

TWO DISEASES OF CACAO TREES.

The occurrence of the disease known as "thrips" on the cacao trees of Guadeloupe has been reported upon by M. Aug. Eloit, who states that the insect causing the disease is widely distributed among the cacao plantations. The pest was the subject of an article in the *West Indian Bulletin*, Vol. II. pp. 175-190, where its occurrence in Grenada, St. Vincent, St. Lucia and Dominica was noted, with a description of its habits and distribution in Grenada. The damage to the cacao trees is sometimes insignificant, sometimes great, according to climatic conditions, drought and neglect rendering the trees very liable to an attack. Experience shows that while proper care of the trees will do much to avert the disease, ultimate reliance must be placed on spraying the trees with kerosene emulsion. The insect appears to be closely allied to the "thrips" affecting cacao in Ceylon, both the Grenada and Ceylon larvæ being characterised by a transverse crimson band.

Professor Giard, to whom an insect has been sent, has named it *Physopus rubrocincta*, though it has been hitherto regarded as belonging to the genus *Heliothrips*. The geographical distribution, as known at present, is Grenada, St. Vincent, St. Lucia, Dominica, Guadeloupe and Ceylon. It is not improbable that the insect will be found to occur in other parts of the West Indies and South America.

A short time ago, attention was drawn to another disease which attacks cacao trees in Surinam, producing bunches of malformed twigs called "witch brooms." In 1900, Professor Bos, of Amsterdam, discovered asci, or fruiting organs, of the *Exoascus* type, on the under side of two rudimentary leaves on the twigs of the "witch brooms," from which he concluded that the disease was due to a new fungus, related to those which produce "witch brooms" in other trees and which he named *Exoascus theobromæ*. Professor Went, of the University of Utrecht, has found that in cacao trees containing "witch brooms," the pods are attacked by a fungus which causes a swelling at the side, and finally produces a worthless, hard and woody pod. He considers that the fungus causing this malformation, may be allied to that which produces the swelling, but since, up to the present, no spores have been observed, the identification of the fungus has been unsuccessful. The planters in Surinam find it advisable to cut out the "witch brooms" as soon as they are observed. This method is sufficient to keep the disease from making much headway, but, if carried on to a large extent, will undoubtedly impair the productiveness of the trees.

LECTURES AND PAPERS.

"THE OBSTACLES TO DEVELOPMENT IN WEST AFRICA."

(By C. F. HARFORD-BATTERSBY, Esq., M.D.)

Admiral Sir JOHN DALRYMPLE HAY presided on the 17th February at a lecture given at the Institute by Dr. C. F. HARFORD-BATTERSBY, Principal of Livingstone College, on "The Obstacles to Development in West Africa."

Although the obstacles to development in West Africa were beyond the necessity of proof, the lecturer deprecated the adoption of a pessimistic attitude with regard to West African matters. The history of the British Empire was, to a great extent, but the record of obstacles surmounted, and he trusted that many of the difficulties that stood in the way of West African progress might, at any rate, be considerably mitigated.

Before giving an account of the two main obstacles—the liquor traffic and the malaria question—the lecturer referred to some of the minor impediments, one of the chief of which had been the apathy with which, in the past, West African matters had been regarded. This indifference, however, no longer existed. There were, at the present time, three weekly papers devoted entirely to West African interests, and, if only the divers forces which were at work in this great region could unite, there was good hope of beneficial results. Reference was here made to the African Society, recently founded in memory of the late Miss Kingsley.

One of the initial difficulties which struck the traveller on his first voyage to West Africa was that of landing. With the exception of Sierra Leone, there was not a good harbour on the coast, and, on account of the surf, landing could only be effected by means of special boats known as surf boats.

Away from the great rivers the only method of transport, in most parts of the country, was still that of human carriers. Roads and railways were, therefore, of the utmost importance, and attention was now being given to the matter. Three lines—the Sierra Leone, the Gold Coast, and the Lagos—were being constructed, and several views were shown illustrating the difficulties, arising out of the nature of the country, with which the contractors had had to contend.

The labour question had been another source of trouble, and this was important with regard, not only to the building of railways, but also to the general development of the country. It was clear that the African must be encouraged to work by making him appreciate the advantages that would accrue to himself therefrom. The lecturer here referred to the recent action of Lord Milner in South Africa in this connection, and hoped that those in authority in West Africa would profit from the experience that they might derive from South Africa.

Beside the need of unskilled labour, West African progress was hampered by the dearth of trained workmen in various industrial pursuits, and the lack of suitable industrial schools had been a serious drawback. Happily, however, this want was being remedied by the establishment of training schools, notably the industrial mission set on foot by Bishop Tugwell on the Niger; which promised to have far-reaching results, and where, in addition to carpentering and building, it was hoped that an agricultural department would be instituted. The Government were also taking up this question of agriculture.

The matter, however, which vitally affected the whole prosperity of the African Continent was the introduction of the liquor traffic among the native races. Only ten years ago this traffic formed a very considerable proportion of the trade of England with her West African possessions. Since then, however, a considerable improvement had taken place. In Lagos, for example, in 1891 20 per cent. of the imports had consisted of liquor, in 1901 the proportion had fallen to 9 per cent. Even from a business point of view, the liquor traffic among the native races did not pay. Where the natives got drink, in most cases they wanted nothing else. Desire for articles of civilised life absolutely did not exist in those who drank imported spirits, and such men would not work longer than would suffice to enable them to get the amount of spirits they required. A diminution of the drink-bill did not, therefore, necessarily mean a loss to the British traders, as it might, and indeed statistics had proved that it had done so, be accompanied by a more than proportionate increase in the demand for other articles. A number of views were shown illustrating the demoralising effect that spirits, chiefly gin, had on the natives. Perhaps, said the lecturer, the best way to make his audience realise how inimical the trade was to all real progress, moral or material, in that part of the world was to draw attention to the fact that gin, in many parts, was still almost the only currency, and that labourers, until quite recently, had usually been paid in spirits.

A general improvement, however, was taking place with regard to the drink traffic. The practice of paying wages in liquor was rapidly decreasing, other kinds of currency were being introduced, and people generally were beginning to recognise the advantages of other kinds of trade. Doubtless many agencies had been at work to bring about these results. The Native Races and Liquor Traffic United Committee, at whose request the Brussels Conference had been called, was one of the chief. This Conference had resulted in the Brussels General Act of 1891, which provided for the absolute prohibition of liquor to natives in various parts of Africa and for the general imposition of a duty of 6½d. a gallon on gin. This duty had since been advanced to 2s. 9d. and would, it was hoped, be still further increased. No measure, with the exception of the decrees for the emancipation of slaves, had had such far-reaching beneficial effects upon the welfare of the native races as this Act.

It would, however, be a great mistake to rest content with the amount of success that had been already attained. On the contrary, the lecturer considered that there never had been a time when greater vigilance was required. Africa was now being opened up in a way absolutely unprecedented in previous history, and the increase of railways, and other methods of travel, would enable drink to penetrate to places as yet uncontaminated. He spoke very strongly on this subject, and concluded this portion of the lecture by quoting some words of the late Queen to King Khama, who visited her whilst in this country. "I approve the provision excluding strong drink from your country. I feel strongly on the matter, and am glad to see the chiefs have determined to keep so great a curse from the people."

The greatest obstacle of all, however, was the unhealthiness of the country. The answer to the question "Why is West Africa unhealthy?" could be given in one word, "Malaria." Happily, however, the persevering labours of a number of scientific men of different nationalities were grappling with the ignorance that had surrounded this mysterious disease, and malaria was now as well, if not better, understood than any other important fever. What was now required was the dissemination of the knowledge thus gained as widely as possible, in order that all might join in putting into practice the methods of prevention suggested by our experts.

Dr. Harford-Battersby here gave a most interesting account of the discovery of the part played by the *anopheles* mosquito in spreading the disease among human beings. This insect, in the act of biting, discharged into the human blood the malarial poison, which, when once it entered the system in appreciable quantities, never really left it, but remained dormant in some part or other of the body, always ready, under favourable conditions, to increase to a sufficient extent to give rise to the fever.

In this connection reference was made to Major Ross, and also to Dr. Manson, under whose leadership the London School of Tropical Medicine had done such useful work, both in educating a large number of medical practitioners proceeding to different tropical climates, and taking part in various expeditions organised for investigating the subject of tropical disease. The Liverpool School of Tropical Medicine had also conducted a series of

investigations into the subject of Malaria on the West Coast of Africa, and was now engaged in carrying through important sanitary operations, besides educational work. Dr. Harford-Battersby also referred to the instruction that was being given at Livingstone College to missionaries in questions of tropical hygiene, and to the facilities afforded by the "Travellers' Health Bureau," mainly by means of the quarterly journal *Climate*, to those who might desire information with regard to what precautions should be taken in entering a tropical climate. Reference was also made to the Colonial Nursing Association, which supplied nurses for hospitals in the tropics; and also, in various parts of the lecture, to Mr. Chamberlain, who in many ways, notably with regard to improved means of transport, regulating the liquor traffic, and the health question, had done so much for the benefit of West Africa. In conclusion, the lecturer hoped that the Governments of the different colonies would take up, in real earnest, the sanitary measures necessary to carry into practical effect the important discoveries that had been made by scientific experts.

Sir John Hay, in proposing the customary vote of thanks, for what he himself had found an extremely interesting lecture, said, in referring to his own experience in West Africa, that he could look back to the time when the Hinterland was unknown. He wondered that the pest that had been so instrumental in spreading malaria should have remained undiscovered for so long, and commented upon the useful work the Colonial Nursing Association was doing in sending out nurses to the tropics. He made eulogistic reference to Mr. Chamberlain (who, in spite of the great responsibilities and anxieties of the South African war, had found time to take such useful action with regard to diminishing the evils of the gin traffic. The Livingstone College must, said Sir John in conclusion, be happy in having such a Principal as Dr. Harford-Battersby.

"BRITISH COLUMBIA."

(By the Hon. J. H. TURNER.)

The Hon. J. H. TURNER, Agent-General for British Columbia, delivered a lecture at the Institute on the 24th February, on British Columbia. The chairman, Mr. WATERLOW, in his introductory remarks, mentioned that Mr. Turner had first gone to British Columbia some 40 years ago, had served the province in various capacities, had entered the first Volunteer British Columbia Regiment in 1864, had been Mayor of Victoria, Minister of Finance and Premier of the Province.

It would be a mistake, said Mr. TURNER, to consider the scenery and climate of the province other than as part of its resources; in fact they were both very important resources, and the beautiful scenery and healthy climate of the province had not only induced large numbers of travellers to visit the country, but had also proved of material consideration and benefit to the lumberman, miner, fisherman, farmer and sportsman. Any stranger visiting British Columbia could not fail to be impressed with the appearance of the children, their beauty, healthiness, vigour and splendid intelligence.

The forests were a great store of wealth to the province; for while the timber supply, generally, of the North American Continent was rapidly disappearing, that of British Columbia had, as yet, been hardly touched. The forest lands of the province were estimated to cover 160,000,000 acres, most of the timber being suitable for pulp-making. So far, however, but two companies had embarked in this industry; the demand for the product however, was daily increasing throughout the world, as the material was now being put to many other uses than that of paper-making.

Pulp-mills required very great power to run them in order to grind up the heavy timber; but in British Columbia this power could be obtained in abundance from the numerous mountain torrents and rivers of the country, although up to the present but limited use had been made of it. Some of the streams, however, had already been harnessed for supplying electrical power to run street cars, work compressors and drills in the mines, and light in the streets and houses, with the result that already these conveniences and comforts of modern life were to be found, not only in the towns but also in the villages and even in isolated houses.

Mr. Turner believed that this abundant energy for the production of electricity found in British Columbia would have a wonderful effect upon the development of the mines and other industries of the province. The mines were probably the most important resource of the country, but they had been even less developed in proportion than the timber.

An interesting account was given of the mines that were already at work, and of the discoveries that had been made of the occurrence of gold, silver, and copper in the various parts of the country. Mention was made of the hydraulic mines in the Cariboo district, and also of river dredging, a method of collecting gold which had not hitherto been successful, although the river beds were known to be highly auriferous. The cause of this non-success had been attributed to errors in the construction of the dredgers; however, the kind that had been so successful in New Zealand was about to be adopted. On the coast of Vancouver Island considerable deposits of auriferous black sand had been found, and a large number of "placer" miners commenced to work on these last year, with very good results to themselves.

The low price of copper was proving prejudicial to the inferior grades of copper mines, but with improved electrical or oil-process appliances, cheapening the charges for reduction, these mines would, Mr. Turner considered, in the near future be able to be worked profitably.

Little attention had, as yet, been paid to the abundant supplies of iron ore that the province possessed. Altogether, although the mining industry of British Columbia was only just beginning to run, Mr. Turner felt confident as to its ultimate prosperity.

Very important resources of the province were its agricultural and grazing lands, eminently suited for fruit-growing, mixed farming, and dairying. The fruit grown in British Columbia was equal to any in the world, and, although the industry had only been started a few years, it was proving very successful, and a considerable quantity of fruit was being exported to the North-West and Manitoba. With regard to cattle, the country was now practically supplying its own wants and was beginning to export; although sheep, pigs and poultry were still imported, a condition of things which would soon be remedied as settlement on the farm lands increased.

The great wants of the country were capital and population. The population was now nearly double what it had been ten years ago, and would increase at a much greater rate if only more capital were forthcoming to develop the timber, mineral, and other resources of the province. The development of so vast a country was, however, a matter of considerable difficulty, and great expenditure was required for making roads, trails, and bridges, for surveys and for building school-houses; as by such works only could the country be fairly opened up. A great deal, however, was now being done every year by these means. Thousands of miles of roads and trails had been built. Laws had been passed to grant bonuses to railways, and about a thousand miles of new lines had been so provided for, and these, if they were constructed, would greatly increase the prosperity of the province.

Standing as it did at the gateway of the Empire to the Western oceans, and possessing such enormous supplies of the resources of modern life, and having so healthy a climate, the future of British Columbia was, Mr. Turner maintained, to become the Britain of the Pacific.

A very interesting portion of the lecture was that devoted to the advantages the country afforded as a tourist resort. Many thousands of pounds were spent yearly by the British people among foreigners in visiting the Continent of Europe, or Egypt, or Palestine, and still more remote countries, on journeys costing as much or more than a round trip to the Pacific and back; a trip which could now be made in the most luxurious manner, owing to the

comforts of the Atlantic boats and the railways across the Dominion. Mr. Turner was most enthusiastic as to the scenery of Canada generally, and more particularly of British Columbia, especially round Vancouver, where a journey could be made in still water up the coast among islands, fiords, and inlets, which formed such a remarkable feature of the western seaboard of Canada. In support of this contention Mr. Turner quoted from the recent reports of the late Royal Tour as to the comforts of Canadian travelling and the beauty of the scenery, and he showed a number of views, notably those of the fine mountain and forest scenery.

In proposing a vote of thanks, Mr. Waterlow expressed himself confident with regard to the future of British Columbia. The mineral resources of the province were being more and more exploited, though little was known in this country about them, owing to the principal mines of copper, gold, silver, and silver lead having been exploited by American and Canadian capital. The progress of the country, during the last few years, had been very great, and it was astonishing how little was known about its vast resources in London and throughout Great Britain.

"TWO ANGLO-RUSSIAN PHILANTHROPISTS."

(By Miss VENNING.)

(ANGLO-RUSSIAN LITERARY SOCIETY.)

At a meeting on March 5, Mr. E. A. Cazalet in the chair, Miss Venning read an interesting paper entitled "Two Anglo-Russian Philanthropists."

In introducing the lecturer Mr. Cazalet said that the paper which the Society was about to hear, owed a double interest to the fact that John and Walter Venning, the two English philanthropists who had done so much for Russian prison reform, were both great-uncles of Miss Venning. The chairman had seen the monument erected at Kherson in memory of John Howard, and the Smolensky cemetery at St. Petersburg, where Walter Venning was buried, and he rejoiced to hear that a memorial in marble, executed by Miss Kathleen Shaw (who was present at the meeting), was shortly to be placed at Totnes, Devon, to the memory of the Venning brothers. He had heard of the enthusiastic way in which Prince Galitzine, who represented the Emperor at Walter Venning's funeral, had spoken of the disinterested and useful work done by John Howard and the Vennings.

The lecturer said that it was in 1793, just three years after the death of Howard, that John Venning first went to St. Petersburg, at the age of seventeen, as a member of an important Russian firm. In speaking of Howard, Miss Venning reminded the Society of the admirable monograph written by its president, Mr. Cazalet, in 1890 for the Prison Congress of St. Petersburg. The medal then conferred on him was the only distinction of the kind ever conferred on an Englishman for literary work in the Russian language.

Although Howard had done much towards bettering the state of Russian prisons, the shocking abuses which still existed aroused John Venning's indignation. It was impossible to gain any real improvement during the reign of the Czar Paul, but a new order came in with the kind and generous Alexander I. While John Venning's sympathy and interest for prison work was thus being aroused in Russia, his younger brother Walter became the friend and co-worker of Elizabeth Fry, William Allen and Samuel Hoare, as a member of the Prison Society of London, founded in 1815. He soon joined his brother in St. Petersburg, where he succeeded in establishing a Russian Society on similar lines. The Emperor appointed Prince Galitzine as its president, while the Metropolitan Philaret, the Archbishop of Tver, and Count Lieven, were among its vice-presidents. And the ladies' committee formed to visit the women prisoners consisted of representative members of Russian Society and the foreign colony.

It was sad to learn that, while still comparatively young, Walter Venning's useful work was cut short by his death from typhus, caught while visiting a prison. John Venning continued his brother's good work, but when Galitzine was replaced by the reactionary Arakcheeff, the Emperor's mind was poisoned against the Society and he was induced to withdraw his patronage, which rendered progress difficult. It was Doctor Leighton, the Czar's physician, father of Lord Leighton, who later on presented an appeal to Nicholas I. for permission to continue the work. The request was granted and the Emperor, moreover, himself became its patron.

Mr. DAVIDSON, who had lived for some time in Russia, said that he was glad to think that the labours of Howard and the Vennings had borne fruit. Immense improvements had been made in the conditions of prisoners since the days of these philanthropists. When the serfs were liberated and open courts of law established, corporeal punishment was also abolished, except in the villages where the commune system existed and the inhabitants elected their own peasant elders. He hoped that the present Emperor's new "Ukaz," abolishing banishment to Siberia, would also prove a great stride in the same direction.

Mrs. ARCHIBALD LITTLE, said that she had quite recently travelled in Russia and Siberia and had seen whole gangs of prisoners on their way to exile, although she had understood that the new "Ukaz" was supposed to be in force.

Mr. HAWES, who had but just returned from Siberia, said that he had also seen prisoners on their way from Russia. They might possibly have been convicted before the "Ukaz" had come into full force, or they might have been on their way to the penal settlement at Saghalien. The speaker had understood, however, that considerable latitude was to be allowed judges and other authorities in interpreting the meaning of the Act and in adapting it to special cases.

Mr. KINLOCH, while expressing his great appreciation of the admirable paper just read, reminded his hearers that the deplorable state of Russian prisons, so vividly described by Miss Venning, was not peculiar to that country. Howard, it should be remembered, had found just as much fault with our own prisons as with those of Russia. He also pointed out that the Emperor's new "Ukaz" was issued mostly out of consideration for the inhabitants of Siberia, in order to save them from the influx of convicts who contaminated the country.

A hearty vote of thanks to Miss Venning was passed.

It may be of general interest to state that the Anglo-Russian Literary Society has the following lectures in prospect, on the first Tuesday of every month, at three o'clock:—

April 1—"Russia and the Russians," with lime-light, by ALEXANDER KINLOCH.

May 6—"Life and Legend in Russian Pictures," by Mrs. ROSA NEWMARCH.

June 3—"A Journalist's Scamper through Siberia and Manchuria," with lime-light, by JOHN FOSTER FRASER.

July 1—Mereshkovsky's "Resurrection of the Gods," by Miss HELEN H. COLVILL (Katharine Wylde).

The Condition of Samoa.—Last year was not a prosperous one for Samoa, owing chiefly to a decline in the yield of copra and a consequent fall in the sales of goods by the local merchants. The total exports amounted to £35,760, against about £50,000 in 1900, while the imports were £69,655, against about £80,000. Copra is at present the sole export. Cacao cultivation is still in its infancy, and the export of this article cannot attain any importance for another five years. The native population of German Samoa is 32,000, and of American Samoa 6,000, while there are about 400 foreigners and 400 half-castes. The drawback to planting at present is that the German authorities only allow leases for ten years; but, in the opinion of the British Vice-Consul at Apia, if the term is extended to 40 years, or if purchase from the Samoans be allowed, a large field will be opened for the profitable employment of capital. Nearly all the imports are from Australia, New Zealand, and San Francisco, except soft goods, which are largely of German origin. The natives both in German and American Samoa seem to be satisfied with the new order of things; there is no good opening at present for either planting or trading, although much money is being spent by the authorities on public works. British shipping forms about six-sevenths of the whole tonnage trading to the islands.

PROCEEDINGS OF INSTITUTIONS.

THE ROYAL AGRICULTURAL SOCIETY OF ENGLAND.

The usual monthly meeting of the Council was held on the 5th ult., Prince Christian (president) in the chair. Three new governors were elected, and 32 candidates were elected members of the Society. Lord Wenlock was elected a member of the Council, in the room of Mr. C. S. Mainwaring, resigned.

Progress in the arrangements for the Society's meeting of 1902, to be held at Carlisle from July 5 to 11 next, was reported. The entries in the implement department close on the 15th ult., and the final date for the receipt of entries of stock, poultry, and produce at ordinary fees is April 15.

A scheme by the Society's consulting chemist for the experimental treatment of two acres of a field in Hertfordshire badly infested with wild onion, the experiments to extend over four or five years, had been approved, and a grant was made to the Botanical Committee for the necessary expenses connected with these experiments.

The Hon. Cecil T. Parker, from the Veterinary Committee, presented a report by Professor McFadyean, which stated that during the second four weeks of the year 68 outbreaks of anthrax had been reported, with 127 animals attacked, as against 53 outbreaks and 76 animals attacked in the corresponding period of last year. During the same four weeks the reported outbreaks of glanders had numbered 77 and the animals attacked 151, as against 97 and 169 respectively during the corresponding period of last year. The outbreaks for the same period of swine-fever had been 115, as against 159 in 1901. During the last four weeks two reported cases of rabies had been experimentally verified; making a total of three since the beginning of the year. All of these had occurred in Wales. The experiments on the possibility of infecting bovine animals with tuberculous material from the human subject had been continued at the Royal Veterinary College during the past month, and a final report regarding them would be presented at the next meeting.

The following resolution was passed and ordered to be transmitted to the Board of Agriculture:—"The Council of the Royal Agricultural Society of England, while approving the limit of 16 per cent. of water suggested to be prescribed for butter by the Departmental Committee on Butter Regulations, learn with much apprehension the view of the committee that butter containing a higher percentage of water will escape the operation of the above limitation if disclosure be made of the fact beforehand. They would especially regret the making of any regulation which would admit of 'milk-blended butter,' or similar mixtures not of the true nature of butter, being sold under any description implying that they were butter, or with the word 'butter' attached to them."

Various reports were presented, and the Council adjourned until Wednesday, April 9.

THE SOCIETY OF ARTS.

Mr. T. W. Holderness, C.S.I., secretary of the Revenue Department, India Office, read a paper at the Society of Arts, on the 13th ult., on "The Indian Famine of 1899, and the Measures Taken to Meet it." The chair was taken by Sir Antony MacDonnell, president of the recent Famine Commission, and formerly Lieutenant-Governor of the North-West Provinces.

Mr. Holderness, at the outset of his paper, said it was almost a truism to explain that, thanks to improved communications and to the development of irrigation in Upper and Northern India, a "famine" in modern India no longer denoted an absolute dearth of food. The drought of 1899 was the greatest in extent and intensity which India had experienced during the last 200 years. The official estimate which computed the crop losses of British India in 1899-1900 at about £50,000,000 was, if anything, under the mark, while those in the native States might be put at about £20,000,000. Describing the relief problem as it presented itself in the autumn of 1899, he said that, while in British India the situation presented some exceptional difficulties, in native States it was grave and complicated in the last degree. The direct expenditure on the famine in British India amounted, up to March 31, 1901, to £6,300,000. Agricultural loans and advances amounted to £1,200,000. Loss of revenue and indirect expenditure were estimated at £2,700,000, after taking credit for £700,000 accruing to the Government as additional receipts from railways and canals. The total expenditure and revenue losses of the native States might be placed at between £7,000,000 and £8,000,000. In regard to the question of mortality, the Famine Commission came to the conclusion that the excess deaths in British India due to the famine were about 1½ millions. In the native States affected by the famine there was a population of 42,000,000 in 1891, and there was now a population only of 36,000,000, while in the States not visited by the famine the population had increased by over 12 per cent. He thought the experiences of the late famine should suggest to native States the expediency of maintaining a financial reserve to meet the drain of similar future calamities.

The chairman, in opening the discussion which followed, said Mr. Holderness's remark that a famine in India no longer meant an absolute dearth of food connoted one of the most remarkable achievements of recent Indian administration. It was not long ago that an Indian famine meant an absolute dearth of food. It meant that in the famine in Orissa in 1866, and still more in that of Madras in 1877; but in the last two famines, those of 1897 and 1899-1900, there never was want of food in any famine-stricken district, only want of money with which to buy it. Owing especially to the system of protected railways, it was an easy matter now to transfer surplus stock from the granary districts to those where it was wanted. But no famine relief in India would be entirely satisfactory which, in preserving the people's lives, failed to preserve also their self-respect and their habits of industry, and he especially urged the importance of strict economy in relief distribution in the interest, not of the taxpayer, but of the people themselves. The real difficulties of India were not difficulties of taxation or climate, but those arising out of social conditions.

Sir William Wedderburn said the efforts of the Government should be directed to improving the economic condition of the cultivator.

In a paper on "Sound Signals at Sea," read before the Society on the 5th ult. LORD RAYLEIGH being in the chair, Mr. E. PRICE-EDWARDS gave some account of the experiments carried out last year by a special committee of the Trinity-house at the fog-signal station on St. Catherine's Point, in the Isle of Wight. The observations were begun on May 8 and were continued until June 13, and no fewer than 4,600 were recorded and tabulated. The committee decided to confine their attention to sound signals only, considering that the various electrical methods of communicating with befogged vessels proposed to them were not sufficiently developed for practical trial.

The lecturer remarked that the real value of a sound signal to the mariner in a fog was, that he could form a fairly approximate idea of the direction from which it proceeded, and was thus able to keep away from it. But with signals conveyed by ætheric vibrations or wireless telegraphy, though he might be informed of the name of the station, he could not tell in what direction it lay, nor could he get any idea of how far it was distant. The instrumental trials at St. Catherine's Point were largely devoted to comparisons of efficiency between the siren principle and the reed principle of producing sounds. The trial of a new form of 7 inch disc siren, with a very low note, gave some interesting results. On one occasion, in fine clear weather, with a light easterly wind, it was audible at a distance of over 20 miles, while the sounds of the higher-pitched cylinder sirens were lost at half the distance.

But, on another day, when the force of the wind was four and the sea was rough, the low-pitched note was at a disadvantage, and was lost at 1¼ miles.

The reed horn, as now developed, must be regarded as inferior to the siren as a sound producer, yet the committee thought it must be admitted that it had its advantages in situations where a sound signal of small range would be serviceable, or where there was no space sufficient for the machinery necessary for sirens. As regards the trumpets associated with the sounding instruments, the lecturer described the elliptical forms suggested by Lord Rayleigh, and pointed out the importance of using trumpets, the proper notes of which were in unison with those of the sound producers.

He went on to discuss the effect of certain atmospheric influences, such as wind and fog, on the propagation of sound, and mentioned the curious "silent areas" which were noticed on several occasions during the experiments, the sounds beginning to die away at a distance of about a mile from the siren or horn until they were very faint, or perhaps inaudible, and then recovering their strength when the three miles line had been passed.

In opening the discussion, Lord Rayleigh remarked that accumulated experience might in time enable the receiver of a signal transmitted by wireless telegraphy to tell from what distance it was being sent, while it was still an open question how far information could be gained as to the direction whence it came.

THE ROYAL GEOGRAPHICAL SOCIETY.

At the meeting held on the 10th ult., under the presidency of SIR CLEMENTS MARKHAM, PROFESSOR W. M. RAMSAY read a paper on "The Geographical Conditions Determining History and Religion in Asia Minor." He said that if geography was to be regarded as the study of the influence which the physical features and situation of a country exerted on the people who lived in it, then in no country could geography be studied so well as in Asia Minor. The physical features of the country were strongly marked; its situation was peculiar and unique; its history could be observed over a long series of centuries, and amid its infinite variety there was always a strongly-marked unity and certain clear principles of evolution, standing in obvious relation to the geographical surroundings.

He described the Anatolian peninsula, which stretched like a bridge between Asia and Europe, and referred in considerable detail to its history. The development had always been in the action and collision of forces moving eastwards or westwards; it had been simply the series of phases in the immemorial conflict between Europe and Asia. It was not merely armies or migration of peoples which had swept eastwards or westwards across Anatolia, but art, knowledge, new thoughts and new religions had trodden the same path in either direction. But there was a growing opinion among the most recent investigators, an opinion which Professor Ramsay said he strongly held himself, that Anatolia was not merely an intermediary, developing foreign ideas in a practical way, but a country which had also played a not unimportant part as an originator.

Anatolia was once the centre of a great empire exerting an influence on the outer world, and it was closely connected with the most fascinating and the most obscure historical problems which were at the present time under discussion. Every step that was being made in the discovery of the early Greek world and the history of early intercourse in the Eastern Mediterranean lands constituted at the same time, indirectly, an advance in the history of the ancient Anatolian world. Twenty years ago the Anatolian empire was not even dreamed about by anybody; even yet it was almost an unknown quantity. The subject now had an acknowledged place in every modern discussion about the early Mediterranean world, and after ten or twenty years it would occupy far greater space than it did now. An ancient system of writing in hieroglyphics, different from any other known system of expressing thought by visible and permanent symbols, was known in Asia Minor through a long process of development, and was dimly traceable as an influence on other countries. Characteristic Anatolian artistic forms had been studied and specified by several investigators.

Speaking of the influence of Anatolian religion on the Greek and Roman world, he said that one feature in the Anatolian religion was prominent and impressive at the first glance. The ordinary and familiar idea was that God was the Father of all mankind and all life. Such was the almost universal European and Semitic conception. But it was the motherhood of the Divine nature that was the great feature in the Anatolian worship. The male element in the Divine nature was recognised only as an occasional and subsidiary actor in the drama of nature and of life. In the social customs of Anatolia, even after it was overspread by Greek manners and Greek ideas, many traces remained of that primitive idea. Descent was sometimes reckoned through the mother; women magistrates were frequently found even in the Hellenized cities of the land. And in its history the same impression remained; it was everywhere the most pathetic of histories. The earliest known trace of the veneration of the Virgin Mary in the Christian religion was in a Phrygian inscription of the second century; and the earliest example of a holy place consecrated to the Mother of God as already an almost Divine personality was at Ephesus early in the fifth century. Of the many movements of thought that had occurred along the great bridge, the only one which could be traced in any detail was that by which Christianity was diffused over the country and into Europe.

COMMERCIAL INTELLIGENCE DEPARTMENT.

CORRESPONDENCE AND ENQUIRIES.

The following are given as specimens of some of the enquiries which have been addressed to, and satisfactorily answered by, the Institute during the past month (March).

** * All communications must be authenticated by the name and address of the writer. Enquiries which would involve special applications or expense will be a matter of arrangement with the correspondent.*

- E. S., *France*.—Names of cotton oil refiners in London.
- C. H. A., *Kent*.—Nin Oil.
- W. S. E., *Scotland*.—General information on Uganda.
- R. K. B., *India*.—Books on tobacco manufacture.
- H. D., *Yorkshire*.—Makers of fire brigade appliances and apparatus.
- L. A. F., *India*.—Ostrich farming.
- Verbal.—Trade in New Zealand.
- „ Brique-making machinery.

REQUIREMENTS REGISTRY.

In order to provide correspondents with an opportunity of making known special "wants" or "needs" in the British Colonies, India, and Foreign Countries, space will be regularly devoted to the publication of approved notices in the IMPERIAL INSTITUTE JOURNAL. Notices, as a rule, should not exceed 25 words in length, for which a charge of 2s. 6d. will be made for each insertion. Special arrangements can be made for longer notices.

SPECIMENS OF FOREIGN AND COLONIAL WOODS desired. Purchase or exchange. Names and localities must be well authenticated. Address—HERBERT STONE, BRACEBRIDGE-STREET, BIRMINGHAM.

THE CURATOR OF THE CANADIAN SECTION OF THE IMPERIAL INSTITUTE is prepared to furnish information about Canadian Trade and to supply names of importers, manufacturers, shippers, etc.

The following trade enquiries have been received at the Canadian Section of the Imperial Institute, from the Curator of which Section further particulars may be obtained:—

Home Enquiries.—A London firm wish to be placed in correspondence with Canadian saw mills which can supply packing-case shooks in quantity.

A Liverpool firm ask for the names of the leading Canadian mining companies who use cyanide of potassium.

An enquiry has been received from a firm of London merchants for the names of Canadian producers and shippers of high-grade feldspar.

A firm of merchants wish to be placed in communication with Canadian manufacturers of doors and mouldings in quantity seeking an export outlet. They are in a position to contract for the output of one or more factories.

A Liverpool firm desire the names of Canadian producers of black ash and basswood boards, also of birch chair seats.

A London firm wish to hear from Canadian lumber manufacturers who can contract for regular supplies of basswood boards cut to lengths and glued together.

An enquiry has been made for the names of Canadian manufacturers of excelsior.

Canadian Enquiries.—A Canadian manufacturer of cutlery asks to be placed in communication with United Kingdom firms importing foreign-made cutlery, particularly for export trade, who might be prepared to deal in Canadian scissors, knives, etc.

A Canadian manufacturer of flooring of various kinds invites correspondence from United Kingdom importers of same.

A manufacturer's agent, resident in Vancouver, British Columbia, wishes to secure the representation of a manufacturer of window and other glass.

A New Brunswick manufacturer of hard-wood of various sorts, who can supply same cut strictly to patterns rough finished, wishes to establish a connection in the United Kingdom.

A Canadian company dealing in grocers' and druggists' supplies, novelties, etc., is prepared to act as resident agent for United Kingdom manufacturers of these goods.

A Montreal manufacturers' agent, who can furnish good references, seeks a few agencies in groceries and provisions, etc.

Foreign Enquiry.—A firm in Brussels (Belgium) desire names of Canadian shippers of feldspar of good quality.

MAPS AND CHARTS.—RECORDS.

[The entire collection of maps (with the exception of a few atlases and maps issued by private firms) consists of authoritative publications of the various government cartographical departments. Such as: the One-inch Ordnance Survey of Great Britain and Ireland, a complete set of Admiralty Charts, and a selection from the maps compiled in the Intelligence Division of the War Office; the monumental "Indian Atlas," and a large number of the publications of the Surveyor-General's Office, Calcutta; the Geological Survey of Canada, and the Government Surveys of Victoria and New South Wales. In the arrangement of the collection, the geographical classification of the War Office Intelligence Department catalogue has, with some modifications, been followed.]

ADDITIONS TO THE COLLECTION OF MAPS DURING FEBRUARY, 1902.

AFRICA.

Egypt.

SUDAN SURVEY, No. 1489:—Musha, Akobo.

I.D.W.O.

Transvaal.

WITWATERSRAND GOLDFIELDS, showing the controlling interests held by the various South African Companies, 1 inch to a mile.

The Cartographic Company.

Presented by the Cartographic Company.

West Africa. No. 1539:—Nikki.

Presented by the Director-General of Mobilization and Military Intelligence.

Seychelles.

MAP of the ISLAND OF MAHE based on survey by Commander Balfour, 1890, and showing the principal landed properties as compiled by S. B. Hobbs, Island Surveyor, 1900.

Presented by the Government of Seychelles.

NORTHERN NIGERIA.

In his report on Northern Nigeria for the period from January 1, 1900 to April 1, 1901, Sir F. Lugard, the High Commissioner, after describing the location of the new headquarters near Wushih, on the Kaduna river, deals as follows with the question of railways:—

"So vast an area as Nigeria, comprising in all some 380,000 square miles (of which Northern Nigeria contains about 320,000), cannot be commercially developed except by railways. I do not here dwell on the political reasons which urge the construction of a railway in this vulnerable part of the Empire as a portion of the scheme of Imperial defence. By railway construction alone can we achieve the rapid concentration of troops and supplies which would supersede the necessity for a greatly increased local force (involving an immense and unremunerative expenditure) to guard our frontiers. Railways are also essential for purposes of internal administration, by facilitating communication. So vast a country cannot, it appears to me, be served by a single railway.

"The Lagos railway has reached Ibadan, 123 miles from the coast, and only about 150 miles of comparatively easy country now separate it from the Niger. It may be advisable to make a branch line from Ibadan to Sapele, where a good port is available (whereas it is calculated that it will cost nearly a million to remove the bar at Lagos), and the branch line would pass through a rich and populous country. In my view the question as to whether this branch line to Sapele should be made, or whether the port of Lagos should be improved, is a matter apart, to be decided by a comparison of cost and a balance of advantages, and it should not interfere with the forward progress of the line now that it has been completed as far as Ibadan. The line should be carried forward without delay to Ilorin, and whether it should be taken thence to Jebba or to Egbaji, must be decided by surveys as soon as possible. The Lagos railway, extended eventually to Kano and Katsena, would develop the western territories, and assist in their defence from possible aggression in that direction.

"An eastern railway, from the fine port of Old Calabar, would have Lake Chad as its ultimate objective, and would protect the eastern frontiers. Whether or not these views recommend themselves, it is, I think, of great importance that a railway policy should be settled, for much can be done in the way of surveys and road making to prepare the way for a coming railway, and such a definite policy would be of the utmost use to local administrators in determining the lines of development and progress. I have strongly urged the great importance of at once deciding at what point the Lagos railway shall cross the Niger, looking, on the one hand, to the magnitude of the task in bridging the river, and, on the other hand, to the comparative feasibility of alternative routes (from the point at which the line crosses) to the north towards Kano.

"No time, I think, should be lost in making these surveys, and in obtaining the best expert opinion as to the bridging work, for on that decision will largely depend the policy in the Protectorate. It may also be borne in mind that once the point at which the railway will cross the river is decided, railway material can, if desired, be more cheaply brought to that point by steamers direct from England at high river, than it could be by rail from Lagos, even when the Lagos railway reaches the river. Construction northwards and southwards (to meet the Lagos line) can be simultaneously undertaken from that point, nor indeed is it necessary to delay the forward progress till the bridge (which will be necessary eventually) is constructed. In fact, so far as the development of Northern Nigeria is concerned, the need is for a railway from the Niger banks to Kano, and not for connection with Lagos. The Lagos railway will, beyond doubt, benefit Lagos, but since Northern Nigeria has the waterway of the Niger for the export of its produce, and since water carriage is cheaper than rail, it is not clear what benefit to its trade the Lagos railway will confer. Every yard, however, of a railway from the Niger to Kano would, by superseding the present caravan transport, tend greatly to promote the development of trade."

With regard to trade competition, Sir F. Lugard says that its absence on the Niger has often been remarked, but it is necessary to bear in mind the distinction between European competition (a) in the native markets, and (b) in the supply of necessities to Government employees. As regards the former, the argument of those who hold that the policy of amalgamation of European interests in undeveloped countries is preferable to competition in the purchase of native produce deserves to be seriously considered. If fair dealing, enterprise, and energy be assured, an amalgamation of European interests may prevent the undue enhancement of prices, and enable the amalgamated trading corporation to set aside capital for the extension and development, which else would be absorbed in the struggle of competition. While the wants of a native in a primitive state remain few, enhancement of prices no doubt decreases supply, for the producers, having acquired all the goods they need, will not exert themselves to tap to the full the resources of the land. For a similar reason it would have an adverse effect upon the supply of labour, and would put up the price of the labour market, and Government being the chief employer, whether for public works, soldiers or transport, would be the principal sufferer; progress would become most costly, and the cost of administration greatly increased. Also, in spite of the clamour that the Niger should be thrown open to trade competition, Sir F. Lugard was unable, after enquiry, to discover any British firms who were willing to enter the field under the principles of free trade without bias or discrimination. The country is now open to them to reap the supposed benefits for which they have so long agitated, but none have come forward to introduce capital or competition, and, so far as could be ascertained, those traders who desired to enter Northern Nigeria have coalesced with the Niger Company, or are debarred, either by lack of capital or by pre-existing contracts, from becoming their rivals.

The competition of the small native trader is also an important matter. Sir F. Lugard was not of opinion that in Northern Nigeria the small trader from the coast would be of any great use, while he is quite certain to give much trouble in his dealings with the natives, and by his fondness for litigation. Experience has shown that, as a matter of fact, he does not travel in the interior and open up markets, but is content to remain to the full as stationary as a European. The immigrant black trader is by no means a desirable person, but every effort should be made to encourage natives of the Protectorate to become small traders and collectors of local produce.

SPONGE FISHING IN THE EASTERN MEDITERRANEAN.

An interesting report on the above subject has been transmitted to the State Department by the United States Consul at Beirut, Syria, from which we extract the following:—

SOURCES OF SUPPLY.—Greek and Turkish sponges have been known to the trade for hundreds of years. Syria furnishes, perhaps, the best quality, and shipments are made from Tripoli and Latakia to Paris, London, Trieste, Hamburg, New York and the Piræus. During the last fifteen years, however, the output has greatly diminished, owing to the introduction by Greeks, in the seventies, of diving apparatus, which proved ruinous alike to fishermen and fisheries. It is estimated that the annual exportation of Syrian sponges at present hardly exceeds \$85,000 in value. In the adjoining territorial waters of Cyprus, sponge beds are being worked with varying success. Sponges were exported from that island in 1898 to the amount of \$10,425, and in 1899 \$28,835 worth were shipped. Egypt, Barbary, Crete, Rhodes, Samos, Calymnos and other islands of the Turkish and Greek archipelagos also produce sponges for export. A large share of this trade was formerly in the hands of merchants, with headquarters in Smyrna and Trieste, but is now centred in London and the Piræus. The United States annually buys sponges abroad to the amount of about \$500,000, the principal shipments proceeding from Nassau (Bahama Islands), London and Piræus. The highest grades of sponges—the softest and finest in texture—are found principally in the Mediterranean. Some of the cheaper varieties are also found there, but none like those taken in Florida or Cuban waters. All through the Mediterranean, except the western half of the northern shore, three species of sponges prevail at a depth of 2 to 100 fathoms, viz.: *Euspongia officinalis*, *Hippospongia equina* and *Euspongia zimocca*.

METHODS OF COLLECTION.—In collecting the sponges four methods are employed—harpooning, primitive diving, dredging, and diving with special outfit. With harpoons, one of the chief difficulties is to see the bottom clearly through a troubled sea. To obviate this a wooden or zinc plate cone, like a water bucket, open at the top and with a glass bottom, is used. On looking through this water glass, which is partly submerged, the bottom of the sea may be clearly studied, even at thirty fathoms, and the proper sponges picked out by the harpoonist. The primitive method of diving, with no other apparatus than a slab of stone as a sinker and a cord to communicate with the surface, is most popular in the Levant. On reaching the bottom the diver hastily snatches up as many good sponges as possible, and, after remaining under water from one to two minutes, tugs violently at the cord and is drawn to the surface. The sponges are collected in a net which the diver carries around his neck.

At greater depths, particularly along the coasts of Asia Minor, dredging is employed usually in winter, when storms have torn up the seaweeds which cover the bottom. To these simpler operations was added, some twenty-five years ago, the "skafander," or diving apparatus, which enables the diver in his submarine dress to spend an hour under water at a depth of from ten to fifteen fathoms. Experience has shown that the employment of the last two methods is a severe tax upon the sponge banks, as everything in sight—sponges large and small—is gathered. Germs and seeds also suffer greatly, and it takes years before a new crop matures. The fishermen who use the "skafander" are frequently stricken with palsy of the lower extremities, stricture, and other complaints. The abuses which so disastrously affect the Levantine sponge industry have prompted a Russian philanthropist, Professor Charles Flegel, to inaugurate a campaign for the abolition of diving apparatus in sponge fishing. Through his efforts, the authorities of Samos, Crete, and Cyprus have prohibited the use of the "skafander"; also the Governments of Italy and France, the latter acting in behalf of Tunis. The question is also being agitated in Egypt. It is said the matter will be taken up and discussed at the International Fisheries Congress, which is to be held in St. Petersburg in February and March. If the Turkish Government joins the crusade, the "skafander" will most likely have to go, and, in the absence of this "engine of destruction" a new era may dawn for sponge fishers and sponge fisheries in the Levant.

As far as known, no steps of importance have been taken to protect the sponge beds in Turkish waters. A close season has been proposed, but has not been established by law. The Government collects from each boat using the harpoon or the primitive diving system 319 piastres gold (\$14.03) a year. A skafander boat pays \$145.20 per season, and its operations are limited to eight months in the year, beginning April 1. From the drag-net boat a licence fee of \$22 is exacted.

MARKET.—At present only occasional shipments of Syrian sponges go direct to the United States. Considerable quantities, however, are bought in London and Piræus. Along the Syrian littoral the demand of merchants, especially for white sponges, exceeds the supply, and prices naturally have an upward tendency. This, in connection with West Indian competition, hinders trade with America. The introduction of antiseptic surgery has also decreased the urgent demand for the Turkish article. With the advent of regular, direct steamship facilities, however, it is likely that Syrian sponges will find a fairly responsive market in the United States. Importers are referred to Dr. Harris, United States consular agent, Tripoli, Syria.

Since making the above report, the Consul has learnt that the Egyptian Government has promulgated a decree (January 10, 1902), prohibiting the diving-bell in sponge fishing. It is also ordered that drag-nets must not be used in waters of less depth than eighty metres (292 feet). Licences for boats for harpooning and nude diving will be granted at \$25 per season, while dredging boats must pay \$50. Any vessel using diving apparatus will be confiscated and sold. Professor Flegel now announces that Samos, Crete, Cyprus, Tunis and Egypt, having banished the "skafander," Greece and Turkey will be invited to follow their example.

NEW BOOKS, etc.

GORDON AND GOTCH. (London, Melbourne, Sydney, Brisbane, Perth, Wellington, and Cape Town.) *The Australian Handbook, (incorporating New Zealand, Fiji, and New Guinea), Shippers', Importers', and Professional Directory and Business Guide for 1902.* Thirty-third year of issue, with maps, plans, etc. La. 8vo., pp. 652+191. (Price, 10s. 6d.) This useful and well-compiled year-book has acquired a wide reputation as a handy and complete work of reference on questions relating to Australasia, and the present issue has perhaps been more carefully edited than any of its predecessors. The Gazetteer portion of the work, descriptive of towns, has now been collated into one section, thus simplifying reference to any of the cities and places in the Commonwealth and New Zealand. General information, statistics of agriculture, minerals, trade and commerce, etc., are classified in connection with each of the States of the Commonwealth and New Zealand under their respective divisions. The flag and seal of the new Commonwealth will be found represented, and the names of the members of both Houses of the first Commonwealth Parliament are given. A copy of the Commonwealth Tariff Bill has been inserted with the latest amendments received. Some of the clauses of this Bill, affecting Shippers and Importers, will probably be considerably modified. The Colonial Buyer's Guide and Shippers' Directory, most useful portions of the book, have been carefully revised and, when necessary, extended. The work has become indispensable to commercial men and those having business connection with Australasia. The immense quantity and variety of information, given in a condensed form, testify to the enormous labour expended on its compilation.

HORACE MARSHALL AND SON. (London, 1901.) *India in the Nineteenth Century.* By DEMETRIUS C. BOULGER. 8vo., pp. 360. With illustrations and a map. This volume contains an account of the progress of India during the past century, a period during which the Empire has seen more changes and improvements than any previous century has brought about. The material progress of India has been enormous, and in every part of the country the benefits derived from British rule are most apparent. After preliminary chapters on the quest and conquest of India, the author describes the first epoch of reform under the Company, and our numerous wars with the Afghans and Sikhs, concluding with the annexation of the Punjab. Lord Dalhousie's administration as Governor-General, which effected many and lasting benefits to the country, receives due recognition, and this is followed by a brief, but well-written summary of the Mutiny of 1857-8, which caused so much misery, and greatly retarded the progress of the country. It, however, led to the disappearance of the East India Company and the proclamation of Queen Victoria as Empress of India. Twenty years of peace followed, interrupted by our last Afghan wars. After describing the rule of the last five viceroys, Mr. Boulger gives a summary of the material progress of India during the century, showing that there has been a great development and expansion in the resources and wealth of the country by means of railways, canals and irrigation. The social circumstances and condition of the people have greatly improved, and though famines are unfortunately still frequent, their effects have been mitigated by the improved means of communication. The author concludes with a "retrospect and a forecast" in which he advocates the formation of an Imperial council which would furnish a safe and sure mode of inter-communication between the Viceroy's Government and the responsible rulers, administrators and merchants of India. Mr. Boulger's opinions are deserving of the highest consideration, but it is to be hoped that his fears of a Russian invasion may prove groundless. He urges the raising of the Anglo-Indian garrison to the highest possible point of strength and efficiency. He says:—"We need not fear the result of any struggle with Russia if we are ready and prepared, but the desire to shirk the conclusion that such a struggle is inevitable is one of the chief reasons why Asiatics doubt our power and the issue of that contest when it comes. They do not understand our reluctance to face and admit the truth, and sometimes our forbearance is interpreted as cowardice. The safety of India depends on her being in a state of military preparedness to resist invasion, and the belief that is in that state is the best creative force of confidence and loyalty."

HORACE MARSHALL AND SON. (London, 1901.) *The Foundation of British East Africa.* By J. W. GREGORY, D.Sc. With maps and illustrations. 8vo., pp. 282. (Price, 6s. net.) This book contains a popular description of the geography, social condition and administration of British East Africa, a colony which, on account of its great natural fertility, is becoming more important every day, especially as the railway from Mombasa has now reached the Victoria Nyanza lake, and there is every prospect of new markets being opened up and trade greatly increased. Dr. Gregory's work will be read with interest, and his observations on the future of British East Africa are deserving of much consideration. He says that the primary need of our possessions in Equatorial Africa is a special service of men appointed by open competition as in the Indian Civil Service, but these men should know the country and understand its people. The separation of the management of East Africa from the ordinary work of the Foreign Office is therefore advisable, and it has been proposed to transfer it to the Colonial Office. "The main requirement for the successful administration of British East Africa is a Government that will curb militarism, raise a permanent staff of men whose hearts are in their work, scientifically develop the natural resources of the country, and enlist the systematic co-operation of the better elements of the native population." The maps and illustrations inserted in the volume will be found most useful.

JAMES M'KELVIE AND SONS. (Greenock, 1901.) *Notes on the Sugar Industry of the United Kingdom.* By JOHN M. HUTCHESON. La. 8vo., pp. 137. (Price, 5s. net.) The author of this book has been connected with the sugar trade in Greenock for fifty-three years, and this long experience has given him an intimate acquaintance with the progress and vicissitudes of the industry. The growth of the sugar trade during recent years has been very great; the consumption, as shown in a statistical table, having increased from 931,668 tons in 1880 to 1,571,357 tons in 1900. During this period the importation of cane-sugar has declined, while that of beetroot has increased enormously. Mr. Hutcheson draws attention to the great change that has taken place, since the abolition of the sugar duty in 1874, in the sources from which we procure our sugars, and in the relative weight of sugar imported. Though the sugar industry is in a declining condition, yet, with the abolition of foreign bounties, some resuscitation may be anticipated. These records of the growth of sugar-refining in the United Kingdom will be found most interesting, especially the personal notes relating to refining firms and families.

JOHN HEYWOOD. (Manchester.) *Handbook of Sierra Leone for 1901 and 1902.* Edited by A. B. C. MERRIMAN-LABOR, of the Colonial Secretary's Office, Sierra Leone. Sm. 8vo., pp. 206. (Price, 3s.) This little handbook is designed to be "a treasury of information" relating to the Colonial and Municipal Governments of Sierra Leone, its trade and commerce, religion and education, the army and navy, and every conceivable matter of interest connected with the Colony and its protectorate. It has been prepared from Government records, and may be regarded as official. The handbook will be found most useful to all who have business relations with West Africa. Some interesting and amusing particulars are given in the biographical sketches of natives of Sierra Leone.

A map showing the extension of the railway to Bo is inserted and also a view of Free-town from the harbour. Judging from the initial number this handbook is likely to have a good circulation.

JOHN MURRAY. (London, 1902.) *Speeches on Canadian Affairs.* By HENRY HOWARD MOLYNEUX, FOURTH EARL OF CARNARVON. Edited by SIR ROBERT HERBERT, G.C.B. 8vo., pp. xvi.+386. (Price, 7s. 6d. net.) This book contains speeches, mainly on Canada, by the late Lord Carnarvon, during the period from 1854 to 1887. In 1867, as Secretary of State for Colonies, Lord Carnarvon aided materially in bringing about the confederation of the provinces now forming the Dominion of Canada. Lord Carnarvon possessed an intimate acquaintance with colonial questions generally, and his speeches will be read with interest, especially that delivered in 1870, on the "Constitutional Relations of the Colonies with Great Britain," in which he expressed his views with regard to the unity of the Empire, and the necessity of closer bonds of union between the colonies and the mother-country. Lord Carnarvon's opinions and suggestions with regard to an Imperial policy have now been acted upon, and an Imperial confederation is likely to be formed. With regard to commercial relations with the colonies, he said that for many years they have been our best customers, and our Colonial Empire is one of such extent, fertility and variety of production that we could get everything we want from within its boundaries. "One of the best things we could do would be to see if we could not devise some form of commercial connection between the colonies and the mother-country." The issue of this volume at the present time is most opportune and it will well repay perusal.

KEGAN PAUL, TRENCH, TRÜBNER & CO. LTD. (London, 1902.) *The British Empire Series, Vol. v.: General.* With two maps. Large post 8vo., pp. 681. (Price, 6s.) This volume is the last of a very important series which has been designed to give reliable information regarding every portion of the British Empire. The subjects of the papers included in this final volume are of a more general and varied character than those in the preceding volumes, and embrace such topics as the "Negro in Barbados"; "The British Empire of To-day and To-morrow," by Sir C. E. Howard Vincent; "The British Navy," by J. C. Wheeler; "Naval Bases and Coaling Stations"; "The British Army"; "The Railway Systems of Greater Britain"; etc. The volume will be found most interesting, as many of the questions of the day relating to the Empire are dealt with. In an appendix there are statistics of the British Empire and colonising countries, a chronological table and census returns. The series will, no doubt, prove an admirable means of spreading a knowledge of the vast extent and the illimitable resources of our Empire.

"KNOWLEDGE" OFFICE. (London, 1902.) *Bird Hunting on the White Nile, a Naturalist's Experiences in the Soudan.* By HARRY F. WITHERBY, F.Z.S. Illustrated, 8vo., pp. 117. (Price, .) This little book, which contains some excellent and artistic photographic illustrations, gives a brief account of a recent tour in the Soudan, undertaken to add to the knowledge of the fauna of that country. It was found that mammals were exceedingly scarce, but 141 specimens of different kinds of birds were observed and collected. The account of the present condition of the country and its natives is interesting, and ornithologists will find the author's observations on the bird-life in the Soudan useful and valuable.

E. MARLBOROUGH AND CO. (London, 1902.) *Hindustani Self-taught, with English phonetic pronunciation.* By C. A. THIMM, F.R.G.S. Crown 8vo., pp. 110. (Price:—paper wrapper, 2s.; cloth, 2s. 6d.) This little book contains Hindustani idiomatic phrases and dialogues, travel-talk, military, legal, religious, commercial and sporting terms, together with tables of Indian money, weights and measures, which will be of practical service to tourists, commercial men, and others. The phonetic system of pronunciation given and the use of roman letters and spellings, instead of Hindustani characters, will help greatly in acquiring a knowledge of the language sufficient for ordinary conversational purposes.

C. MITCHELL AND CO. (London, 1903.) *The Newspaper Press Directory and Advertisers' Guide; and a Directory of Class Papers and Periodicals.* Fifty-seventh annual issue, 1902. La. 8vo., pp. 223. (Price, 2s.) This useful and well-compiled directory presents in its fifty-seventh issue all the excellent features that have appeared in previous editions. In addition this year some special articles have been added which enhance the value and interest of the work. Mr. Hugh Fraser, LL.D. contributes an article on "The Legal Year in its relation to the Press," and Mr. Moore has written one on "The Press Coronation," showing the progress made by the British Press during the reign of Queen Victoria. The Hon. W. P. Reeves, Agent-General for New Zealand, and the Hon. Sir John A. Cockburn, have written on Colonial questions, and there is also an interesting article on "The Commonwealth Tariff." Special articles will be found in the South African section and there are, in addition, the usual Trade Reviews. The compilation has been carried on with extreme care, so as to ensure accuracy. From the preface we learn that the number of newspapers now in existence in the British Isles reaches 2,457; magazines, including quarterly reviews, number 2,486, of which 508 are of a religious character. This will give some idea of the necessity of having a directory for such a vast array of publications.

SAMPSON LOW, MARSTON AND COMPANY, LTD. (London, 1902.) *Types of Naval Officers drawn from the History of the British Navy.* By A. T. MAHAN, D.C.L., LL.D., Captain United States Navy. With portraits. 8vo., pp. xiv+500. (Price, 10s. 6d.) In this book the writer of *The Influences of Sea Power on History* has supplemented his work by an account of the conditions of naval warfare at the beginning of the eighteenth century and its subsequent development during the period, as typified in the lives of six of the most distinguished British seamen who played a great part in the evolution of sea fighting and the improvement of the system which enabled Nelson to achieve his fame and save Europe from the grasp of the great Napoleon. These were the men who restored to the British Navy the supremacy of the seas, after the misadventure at Toulon in 1744, and Minorca in 1756; and the traditions handed down by them are still treasured as sacred in the British Navy. Capt. Mahan has, by this most readable volume, added greatly to his already widely known reputation and authority as a naval historian.

SONNENSCHNIG AND CO., LTD. (London, 1902.) *What's What: a Guide for To-day to life as it is and things as they are.* By HARRY QUILTER, M.A., Trin. Coll., Camb.; Barrister-at-Law. 8vo., pp. 1182. (Price, 6s.) This volume contains a vast amount of useful information concerning men, places and things in general, well selected and arranged in a handy form for reference. The criticisms and opinions of the writers are distinguished by their acumen and originality, and there is nothing dull or commonplace to be found in the pages of this work such as is frequently met with in many guide books. The "paragrams," of which there are no less than 2,500, are written in a vigorous and terse style; and include a great variety of subjects, so that ordinary readers, especially those whose reading does not extend much beyond the newspapers and magazines of the day, will find the book exceedingly interesting and instructive. The observations on art, literature and education are specially noteworthy. The illustrations, particularly the reproduction of a charming view of Amiens by David Cox, never hitherto published, enhance the attractiveness of this cleverly compiled and entertaining volume.

STUBBS' LTD. (London, 1902.) *Stubbs' Commercial Year-Book and Gazette Index, 1902.* Twenty-third Annual Issue. Containing the Registered Information for the year 1902. For subscribers only. 8vo., pp. 336. This year-book is intended for commercial men, as its chief feature is an index of the entries in the Gazettes for the year 1901. It also contains epitomes of the laws relating to cheques, payment of money, bankruptcy and partnership; the public legislation of 1901; statistics of commerce and trade, etc., which will be found useful.

THE "GAZETTEER OF INDIA."—The Secretary of State for India has appointed Mr. James S. Cotton, for many years editor of the *Academy*, to carry out the revision of the *Imperial Gazetteer of India* decided on some time ago. Mr. Cotton was the late

Sir William Hunter's chief assistant in the original compilation of the great work he is now to revise and bring up to date. His headquarters are to be at the India Office, and the writing of special sections will, as in the case of the first edition, be entrusted to expert assistants.

THE "FINANCIAL TIMES," LIMITED. (London.) *The Mining Year-Book, 1902.* Edited by A. N. JACKMAN. Introduction by J. W. BROOMHEAD. With Directories of Directors, Secretaries, Mining Engineers and Metallurgists; Glossary of Mining Terms. 8vo., pp. 1,317. (Price, 15s.) The second issue of this excellently compiled year-book shows a considerable improvement on the first edition as regards facility for reference and saving of time and trouble. The volume is prefaced by an able article on the rise and present position of mining in all the principal goldfields of the world, and a glossary of mining terms for the assistance of the general reader. An important addition to the book is the list of Mining Engineers and Metallurgists, their qualifications, the nature of their experience and where acquired, and their present addresses, telephone numbers, and telegraphic addresses. This information will be of great value to officials of mining companies. Another improvement is that a comprehensive analysis of the last statement is shown alongside the corresponding figures for the previous period. Every care appears to have been taken to make this Year-book complete, accurate, and up-to-date. The numerous additions have necessitated a considerable enlargement of the book, and the printing and typing are clear and effective. To all interested in mining, in any part of the world, the book will be of great service, and it should be very useful to mining and finance companies.

THE SCIENTIFIC PRESS LIMITED. (London, 1902.) *Burdett's Hospitals and Charities, 1902, being the Year-Book of Philanthropy and the Hospital Annual.* By Sir HENRY BURDETT, K.C.B. Thirteenth year of issue. 8vo., pp. viii+994. (Price 5s.) This useful year-book contains an exhaustive record of hospital work and a review of its position and requirements, with articles on management, expenditure, the nursing department, and special incidents and hospital construction in 1901. The book becomes more valuable each year, as the interest in hospitals and hospital work increases. The example of the King in initiating and bringing to a successful issue the Prince of Wales's Hospital Fund, now by his wish styled "King Edward's Hospital Fund," has given a great impulse to the support the hospitals receive, and all who wish them to continue to be successful are invited to subscribe to a Coronation Gift to provide a sum equal to at least £100,000 a year, secured upon invested capital and annual subscriptions, which shall be placed to the credit of this fund. This would greatly aid the carrying on of the work of the hospitals, and relieve much of the anxiety with regard to their support. Sir Henry Burdett's year-book will be of great service in giving information as to the channels in which this assistance may be most usefully directed.

CITY BRANCH OF THE IMPERIAL INSTITUTE, AT 112, CANNON STREET, LONDON, E.C.

The CITY BRANCH OF THE IMPERIAL INSTITUTE embraces:—

1. A News Room, supplied with:—

- The chief British Industrial and Commercial Periodicals;
- Many United States, German, and French Commercial Periodicals;
- Commercial Periodicals of the principal Colonies and of India;
- Market reports, prices-current, and statistics.

2. An Enquiry Office, in telephonic communication with the Commercial Information Office of the Imperial Institute at South Kensington. Enquiries relating to industrial, commercial, and other matters connected with the Colonies, India, and Foreign Countries, are received and promptly dealt with, and samples of products from the Colonies and India, stored at the Imperial Institute, can be inspected or obtained. Expert valuation will be furnished of samples submitted for that purpose.

The News Room is *free to Fellows* of the Institute, as is also the Enquiry Office for obtaining such information as does not involve special research or correspondence.

A *subscription* of the sum of one pound per annum, payable in advance, secures the *free use* of the News Room, and the supply, free of charge, of information not involving special research or correspondence.

Subscribers of one pound per annum are also entitled to inspect, *free of charge*, any maps or charts included in the Map Room collection at the Imperial Institute, South Kensington, and to consult any works, or official papers, included in the Institute Library. Passes admitting to the Library or the Map Room for the foregoing purposes will be issued, as required, on application to the Clerk at the City Office.

Non-Subscribers to the City Branch can be supplied with information upon the following terms:—

- First* enquiry, not involving special research or correspondence, *free*.
- For each subsequent enquiry, not involving special research or correspondence, one shilling.
- For each enquiry, involving special correspondence, or interviews with home-experts, etc., five shillings.
- For each enquiry involving Colonial or Foreign correspondence, ten shillings; or by special arrangement, if likely to be voluminous.

Subscribers will have to pay the charges specified under (c) and (d) in the foregoing clause: *Fellows* will only be required to reimburse the Institute any out-of-pocket expenses incurred in connection with enquiries coming under those heads.

The Information Department will undertake to obtain analytical or other examinations of samples by competent Experts, upon payment, by

persons submitting them, of the usual professional fees, to be previously specified, and agreed to by the applicant.

The Institute will undertake to procure, and supply, at cost price, translations into any language, of trade circulars, prices-current, etc., and the conversion of weights, measures, coinages, etc.

The City Branch will shortly be removed to 49, Eastcheap, E.C.

SCHOOL OF MODERN ORIENTAL STUDIES.

Founded by the Imperial Institute in union with University College and King's College, London.

In 1887 it was suggested that a school of Modern Oriental Studies should be organised as a branch of the Institute, in imitation of the very efficient establishments of this kind which are carried on, with Government resources, in France, Germany, and Austria. The promulgation of this proposal led to negotiations with the authorities of University College and King's College, London, which resulted in their co-operation with the Institute in the establishment of the School. A Special Committee having been appointed to decide upon a system of work, it was arranged that classes for instruction in the Oriental languages required by students qualifying for examinations for the Indian Civil Service, should be held at University College, while modern Oriental languages, other than the Indian languages, should be taught at King's College, and that the Imperial Institute should undertake the general administrative and financial work. The School was officially opened in January, 1890, when an inaugural address was delivered by Professor Max Müller at the Royal Institution, in the presence of His Royal Highness the Prince of Wales. The daughters of the late Colonel W. J. Ouseley (Bengal Army) have established and endowed, in his memory, three scholarships, in Arabic, Persian, Hindustani, and other Oriental languages, in connection with the School, each one of the value of not less than £50 per annum. The following Scholarships have already been awarded:—

An OUSELEY SCHOLARSHIP of £50, tenable for two years, will be awarded this year, should sufficient merit be shown, for proficiency in PERSIAN. No person will be admitted to competition for a Scholarship in a language which is his own mother tongue, nor for a Scholarship in a language allied to his mother tongue.

The examination takes place early in July, 1902.

Competitors must give notice on or before July 1, 1902.

The ages of Candidates are to be above 17 and under 25 years on January 1 of the year of examination.

Further particulars may be obtained from the Secretary, S.M.O.S., Imperial Institute, S.W.

GENERAL INFORMATION FOR INTENDING STUDENTS AT THE SCHOOL.

The classes which the "School of Modern Oriental Studies" comprises, are divided under two heads.

DIVISION I. includes classes for all Oriental Languages especially required by Students qualifying for examinations for the Indian Civil Service, the instruction being of the same character as that provided for some time past at University College and at King's College. This Division includes instruction in Sanskrit, Bengali, Hindi, Hindustani, Tamil, Telugu, Punjabi, Pali, Marathi, Gujarati, Arabic, and Persian.

DIVISION II. consists mainly of classes for Modern Oriental Languages other than the Indian Languages.

The courses of tuition are of a practical rather than of an academic character; they have particular reference to commercial and official requirements and to the facilitation of colloquial intercourse with natives of Oriental Countries.

It is in contemplation, so soon as the number of students warrants the expenditure, to secure the services of native readers and teachers of conversation in connection with the classes of this Division.

The classes under this Division are conducted at King's College, where arrangements will also be made for the establishment of evening classes.

The Languages taught in Division II. comprise Colloquial Arabic, Armenian, Modern Greek, Colloquial, Persian, Russian, Turkish, Chinese, Burmese, Japanese, Malay, and Swahili.

Arrangements have been completed by the Managing Committee and approved of by the Governing Bodies of the Imperial Institute and of the two Colleges, for the pursuit of studies relating to the history, literature, commercial and physical geography, political economy, and the natural and industrial resources, of the countries and districts in which the various languages are used.

Special Lectures or courses of Lectures will be delivered from time to time, in connection with the School, by experts or specialists, in any of the foregoing subjects.

There are three terms, of about ten weeks, in each year, as follows:—

SPRING TERM—commencing about the middle of January.

SUMMER TERM—commencing early in May.

AUTUMN TERM—commencing about the middle of October.

A fee of THREE GUINEAS per term will have to be paid, in advance, by each Student for each Language taken up for instruction. This payment will entitle the Student to the use, within the College, of text books, dictionaries, and works of reference required in connection with the particular Language taught, and to the use of all the facilities which it is proposed to secure in the development of the School.

Accommodation is provided at the Imperial Institute to enable Students to pursue their studies at hours when the classes are not held. The Libraries of both Colleges will be open to Students in any of the classes of the School, during the usual hours of study.

Intending Students should communicate with the Secretary at the offices of the Imperial Institute, London, S.W., where the registration of Students will take place, and where all information regarding the School will be supplied.

MONTHLY COMMERCIAL AND INDUSTRIAL SUMMARIES.

GENERAL COMMERCE AND INDUSTRY. COLONIES.

Angora Goats in New Zealand.—Angora goats appear to be rendering a good account of themselves in New Zealand as destroyers of briars and brambles, which spread so freely as to become veritable pests unless kept in check. These goats are already running in several parts of the colony, and are found to be particularly well suited to rough country. The Agricultural Department recently imported a number from South Australia, and these, according to the *Wellington Post*, have been doing well on Somers Island, where they were sent to undergo quarantine. There exists throughout New Zealand a considerable demand for these animals, but much difficulty is experienced in supplying it. The Turks, it seems, have prohibited their export altogether, whilst in Cape Colony a heavy export duty has been imposed. Besides their value for keeping down brambles, briars, and similar pests of the land, the goats give a good supply of rich milk, whilst from each animal it is possible to cut every year from 4 lb. to 6 lb. of mohair, worth, it is stated, from rs. 4d. to 2s. per lb. It is estimated that there are at present about four million Angora goats in Cape Colony.

Camphor Production in Ceylon.—The production of camphor has increased in Ceylon since 1900. With the high price of £10 per cwt. which is obtained in the principal producing districts of Japan in consequence of the Government monopoly, the prospects of this new product in Ceylon are very favourable. Up to the present the camphor trees in some districts of the island are growing satisfactorily, and a series of distilling experiments gave very satisfactory results.

Quebec.—PROGRESS OF SETTLEMENT.—According to the recent report of the Minister of Lands, the total area of the unceded territory of the province of Quebec (at present subdivided into farm lots) available for concession is 6,777,287 acres. During the last fiscal year 183,728 acres were sold for \$95,026. Free grants to the extent of 1,700 acres were also made on certain colonisation roads, and 10,090 acres were conceded in the same manner to fathers and mothers of twelve living children. The Minister is pleased with the fact that the past year has shown an increase in the superficial area of the lands sold or granted for colonisation purposes, and in the number of patents issued in favour of settlers who have fulfilled all the settlement conditions, which indicate a marked increase in the number of farms in all those regions of the province where colonisation is in a flourishing condition. This improvement he attributes to the remunerative prices now obtained for farm produce, to the prosperous condition of the lumber trade generally, and to the great activity with which lumbering operations are being pushed all over the province, and especially to the manufactures of pulp wood.

Queensland.—TRADE IN 1901.—The total value of Queensland imports for 1901 amounted to £6,070,706, and the exports were £8,611,044, comprising—gold, £2,544,959; hides and skins, £419,331; preserved and frozen meat, £1,290,351; pearl shell and *bêche-de-mer*, £119,792; sugar, £756,150; tallow, £213,227; tin, £114,111; wool, £2,109,068; green fruit, £101,535; all other, £942,520. Compared with the previous year, the imports show a decrease of £1,009,967, exports a decrease of £456,931. The border Customs for 1901 shows imports £259,460, and exports £454,909.

South Australia.—DISCOVERY OF PHOSPHATES.—The Government geologist, Mr. Brown, has reported to the Government regarding the discovery of phosphates in the hundred of Clinton, York's Peninsula. His investigation of the deposits leads him to believe that the quantity of rock containing a sufficient percentage of phosphate of lime to render it of commercial value, is very large, and the configuration of the country most favourable to the opening of quarries, whereby rock can be raised cheaply and expeditiously, and shipments averaging 70 per cent. tri-calcic phosphate and less than 6 per cent. iron and alumina could easily be selected. Mr. Brown says that it is most probable that deposits of phosphatic rock occur in other portions of the districts where Cambrian limestone occurs. The discovery is important, not only to South Australia, but to the Commonwealth generally, as, up to the present time, no similar deposit so likely to prove of such great commercial value has been found on this continent.

Victoria.—TRADE IN 1901.—The Custom-house statistics for December enable the returns in Victoria for 1901 to be summarised. The increase in imports amounts to a little over 3 per cent., while the rise in exports is equal to nearly 7 per cent. The imports of gold were less by £250,000, owing to the Perth Mint's operations. Wool imports were £188,000 less, but wheat, owing to the large Riverina crop, more than doubled, the rise being £121,000. In all other merchandise there was an advance of £895,000. In exports, gold dropped by £823,000, but wool was £84,000 greater. Wheat and flour advanced by £563,000, but butter fell away by £245,000, and is still declining rapidly. All other exports showed a fair advance, and, on the whole, the return is a satisfactory one.

Western Australia.—MINERAL OIL.—It is reported that there have been important developments recently in connection with the petroleum and asphalt discoveries in the vicinity of the Warren River, and that arrangements have been made to test the country and to sink a trial bore to a depth of 1,500 feet. For many years past, it is stated, settlers in the vicinity of the Warren River, which is on the southern coast of Western Australia, have known that bituminous deposits were to be found along the coast between Capes D'Entrecasteaux and the Leuwin. Along the shore masses of asphaltum were found, apparently cast up by the waves. The analyst, Mr. S. S. Dougall, F.I.C., reports that this is a singularly rich asphaltum, being, for all practical purposes, pure, only a minute portion of foreign mineral matter (dry sea sand) being present. A little further inland traces of mineral oil were found in the sand dunes, and at a distance of about three miles from the shore sandstone, saturated with petroleum oil, was found in the water-course of the Warren River.

INDIA.

Cotton-seed Machinery.—The Upper Indian Chamber of Commerce at Cawnpore desires estimates from manufacturers of cotton-seed oil machinery for a small plant complete, including machines for stripping the lint from the seed, removing the shell, grinding the kernel, and pressing the meal for oil, and also for an oil-refining plant, to include the arrangements necessary to enable the wastes given off by the oil in the process to be utilized in soap-making.

Demand for Refrigerating Machinery.—Writing from Bombay an engineering correspondent of the *Iron and Coal Trades Review* sends the following particulars of the class of refrigerator which finds extensive demand among the Indian hotels. They are comprised in the specification sent by

Mr. Tata, who is building what will be one of the largest hotels in the Far East. "(1) The refrigeration machine is to cool a cold chamber on the ground floor, about 37,500 cubic feet in space, the chamber to be maintained at about 32 degrees; (2) The machine is to make a ton of transparent ice per day in 12 hours; (3) The machine is to be capable of cooling by, say 10 to 15 degrees, twenty suites of rooms at the western extremities of the building; (4) arrangements should be made with a view to extending the cold chambers in future to include the basement. The motors for driving the refrigerating equipment are to be shunt-wound, two in number. They are to work at a potential of 100 volts and to develop 40 horse-power each at normal speed.

Indian Textiles in Seistan.—According to a report of Captain Webb-Ware, the Political Agent at Chagai, a recent inspection of the Nasrabad Bazaar showed that, excluding a Russian cloth known as shikin maghut, the textiles sold in Seistan are almost wholly of either English or Indian manufacture. Shikin maghut is a kind of moleskin cloth, which is manufactured in Russia in various qualities and shades, and forms one of the most important Russian exports to Central Asia. That this cloth appeals to the native taste is undoubted, but it is difficult to say why this should be so, for the dyes used are bad, the material is second-rate, and the prices asked are high. The Political Agent goes on to say:—"There is little doubt that if Indian manufacturers were given a fair field, they could manufacture a similar article of higher quality and sell it at a lower price in Trans-Caspia. Indian manufacturers might do well to turn their attention to the manufacture of this cloth, as it commands a ready sale on the frontier." The Political Assistant at Chagai is prepared to supply patterns on application.

Rubber Growing in Burma.—It is satisfactory to read in the Administration Report that the experimental rubber garden at Mergui was worked profitably during the year. It has only recently been started, and the fact that it already shows a profit reflects considerable credit on Mr. Ryan, the forest officer, who is in charge of it. Judging from all appearance the demand for rubber throughout the world is likely to be an increasing one, and the Government acted rightly, we think, in starting a good sized plantation at Mergui of 10,000 acres, the climate there being apparently very favourable for its growth. It would have been hopeless to expect private capitalists to undertake such a venture at the outset. But if the Government venture pays they will no doubt be glad to follow suit, and a new industry will have taken root in the province which promises to be a lucrative one.—*Rangoon Gazette*.

FOREIGN COUNTRIES.

American Coal Depot in Messina.—An American syndicate has requested the Italian Government to grant them a large piece of ground at San Raineri on the east side of the harbour of Messina. The syndicate will establish a depot for requirements of the navy and trading ships, as well as for trade purposes. The stock of coals will average about 40,000 tons.—*Handels Museum*.

British Trade with Argentina.—The imports of all kinds into Argentina in 1901 were valued at \$113,959,749. Of the countries whence these were derived, the United Kingdom ranks first for \$36,460,808, or 32 per cent. of the whole. Next come Germany, \$16,724,549, or 14.7 per cent.; United States, \$15,533,639, or 13.7 per cent.; and Italy, \$14,736,103, or 12.9 per cent.

Commercial Museum and Intelligence Departments in Bulgaria.—The Austrian Consul in Rustchuk states that the Bulgarian Ministry of Trade and Agriculture proposes to establish in Rustchuk, as well as in other important towns in Bulgaria, branches of the Bulgarian Commercial Museum and to increase by these means the utility of this museum. The Chamber of Commerce of Rustchuk resolved to follow the example of Philippolis in opening a commercial intelligence bureau.—*Handels Museum*.

Demand for Machinery in Siberia.—According to the *Bulletin Commercial* there is now an opening in Siberia for many kinds of goods not formerly sent to that country. The classes of articles most likely to find a market in eastern Siberia are, according to this statement, agricultural implements, machinery and industrial material for flour mills, oil manufactories, butter factories, distilleries, tanneries, machinery for gold, iron and coal mines, saw mills, machinery for brick fields and salt works, and machinery for manufacturing rope, paper, etc.; while the demand for wines, spirits, silk goods, furniture, books, musical instruments and jewelry is apparently small. Commercial bodies desirous of seeking an outlet for their goods in Siberia should endeavour to get into touch directly with the consumers by the establishment of large deposit warehouses, where goods could be sold both wholesale and retail. The Siberian trader is accustomed to add a large percentage on the goods he sells, so that by passing the merchandise through his hands he would obtain the greater part of the profits.

German-American Competition in Cuba.—Exports from Germany to Cuba have largely increased since the United States, in the place of the different treatment of foreign goods which were imposed by the Spaniards, has given similar duties on all goods from different countries as those from the United States. North American commercial houses think the cause of this, to them, disquieting state of affairs is that there are direct steamship lines between Germany and the harbours of Cuba, whilst the centres of trade in the north-east of the Union have no such direct steamship lines. New York exporters, therefore, put themselves into communication with shipowners for relief from this want of communication, and, as a result, a new line of steamers has been established between New York and Havana, which will also touch the sugar-exporting ports of Matanzas and Cardenas.—*Handels Museum*.

Japanese Commercial Attachés.—The Japanese Government has decided to send commercial attachés to some of the principal towns and manufacturing places, and to commence with London, New York, Tientsin, and Shanghai. Those in London and New York will be concerned with financial and general industrial matters, whilst those in Tientsin and Shanghai will only have to look after the interests of Japanese exporters and traders. An expert is to be sent to a North American town, either Boston, Philadelphia or New York, in order to report to the Japanese Government as to the customs of trade there.—*Handels Museum*.

Joint Agents in Mexico.—American merchants deal with Mexico frequently through joint representatives. Producers of various goods form a group which is represented in Mexico by one representative, who receives a fixed allowance for travelling expenses, rents, taxes, and sample dépôts. These men work exclusively for their firms, and are in a better position to serve their interests than the agents of European houses who do not receive such an allowance. Under these circumstances, it is quite to be understood that agents who previously represented European firms, will only continue to do so if they receive a similar allowance. If this is refused then they will work preferentially for North American firms.—*Handels Museum*.

Openings for Capital in Foochow.—It is mentioned by the British Consul that, as a manufacturing and mining field, Foochow has not yet been exploited, and in both respects there

are great possibilities. The establishment of the match factory and saw mills was a move in the right direction, and indications are not wanting of a serious intention on the part of the provincial authorities to examine into and utilize the unquestionable mineral wealth of Fokien. Foreigners, too, are interesting themselves in mines, especially of coal, of which a good description of anthracite is to be found in the interior; while not far from Foochow deposits of coal of as yet doubtful quality are said to exist. It is also stated that there is clay of good brick-making quality not far from Foochow, and, with the cheapness of coolie labour, it will no doubt be utilized before long. Foochow granite, of which the quantity is practically unlimited, is occupying the attention of some enterprising minds, and building stone of a rough quality is abundant. The vast number of camphor trees in this province are rarely cut for camphor production, the timber being at present put to many other uses, boats even being built of it.

LABOUR MARKET.

UNITED KINGDOM.

Employment in the Coal Mining Industry in 1901.—Particulars have been issued by the Home Office regarding the production of coal and the number of persons employed in the principal colliery districts of the United Kingdom. It appears that last year the output of coal was 219,037,240 tons, as against 225,170,163 tons in 1900. The number of persons employed in and about mines under the Coal Mines Regulation Act, was 806,735 last year and 780,052 in 1900. It is interesting to note that during the past five years the output has increased 12.1 per cent. and the number of persons employed 16.5 per cent. The following table shows the numbers employed in each inspection district, comparative figures being given for 1900:—

District.	Number of Workpeople employed in Mines under the Coal Mines Regulation Act, in	
	1900.	1901.
Northumberland	39,728	41,145
Durham	112,835	113,934
Yorkshire	107,901	111,810
Lancashire and Cheshire	87,976	92,791
Derbyshire	46,788	49,913
Notts. and Leicester	34,108	35,322
Staffordshire	47,788	49,475
South Wales and Monmouth	147,652	150,412
West Scotland	73,400	75,732
Fife	16,339	17,420
Other Districts	65,537	68,781
United Kingdom	780,052	806,735

The considerable change which took place in the wages of coal-hewers is shown in the following table, which gives the percentage above "standards" at the end of the years 1900 and 1901 in the principal districts:—

Principal Districts.	Percentage above "standards" at end of		Increase (+) or Decrease (−) on "standards" compared with	
	1900.	1901.	A year ago.	Five years ago.
Northumberland	61.25	31.00	−30.25	+27.25
Durham	65.00	40.00	−25.00	+25.00
Yorkshire, Lancashire and Midlands	50.00	60.00	+10.00	+30.00
South Wales and Mon.	73.75	66.25	−7.50	+56.25
West Scotland	100.00	50.00	−50.00	+37.50
East Scotland	97.50	47.50	−50.00	+47.50

It may be added that the average value of coal at the pit's mouth rose from 5s. 10d. per ton in 1896 to 10s. 9d. in 1900. The corresponding average for 1901 is not yet available, but in Northumberland the mean of the ascertained quarterly averages fell from 10s. 3d. in 1900 to 8s. 9d. in 1901.

COLONIES.

The monthly report, compiled by the EMIGRANTS' INFORMATION OFFICE, states as follows:—**Canada.**—The report of the Dominion Labour Bureau for February states: "Except in those trades in which temporary cessation of employment is expected because of the nature of the season, industry and trade are active and few hands are idle." "In manufacturing and mining, work has for the most part been plentiful and steady throughout the month, and the condition of labour in most individual trades may be described as good." Persons emigrating to Canada this year should start in the spring. The principal demand is for competent farm labourers and female servants.

Australasia (New South Wales).—The building trade is not so brisk as it was, and less wages are being accepted. The engineering trade continues good, with full rates of pay. The strike among the tailors has been settled, and the minimum wage has been fixed at 17s. 6d. to 22s. 6d. a week. The wharf labourers are agitating for a rise in their wages to 1s. 3d. instead of 1s. an hour. Country districts are suffering much from the severe drought, and in some parts it is impossible to obtain employment owing to want of water and of feed for cattle. The coal trade continues busy, but silver-mining at Broken Hill is very slack, and many hands are out of work. The labouring classes generally are complaining of the increased cost of living, owing to the new tariff. (**Victoria.**)—There is a good demand for farm labourers, and especially for men able to milk, but employment is not always regular. The difficulty of getting good milkers has been one of the principal causes of the recent reduction in the output of butter, and is seriously hampering the dairying industry. There is no special demand for mechanics in Melbourne or other towns. (**South Australia.**)—Considerable numbers of mechanics and labourers, more especially those in the engineering trades, have been out of work at Gawler. Copper-mining has been very slack lately, owing to low prices, and many hands have been thrown out of employment at the Moonta mines and by the closing down of the Port Augusta smelters. (**Queensland.**)—According to the report of the Government Labour Bureau for the quarter ending December 31st, 1901, the only demand in the north was at Townsville, Charters Towers, and neighbouring places for female servants, general labourers, plantation labourers, and a few farm labourers and mechanics; in the central districts the only demand was for a few general labourers; in the south there was a large demand for farm labourers and general labourers, and some demand for plantation labourers. Miners were not in demand in any part of Queensland. (**Western Australia.**)—Reports received at the Government Labour Bureau in Perth at the end of last year show that there was a good demand for

men at Perth, especially for those in the building trades; that there was no demand at Fremantle, Geraldton, Collie, or Busselton; that there were many unemployed at Coolgardie, Kalgoorlie, Kanowna, and neighbouring goldfields; that at Northam, there was a very good demand for mechanics and unskilled labourers; and that in many agricultural districts in the south-west there was always a good demand for competent farm labourers, able to milk, work machinery, and take care of horses; female servants were wanted in nearly all districts. (New Zealand).—The clothing trade has been very busy at Auckland, Napier, Wanganui, Palmerston North, New Plymouth, Westport, Hokitika, Christchurch, Invercargill and elsewhere. The building trades have been busy generally, especially at Auckland, Gisborne, Napier, New Plymouth, Westport, Christchurch and Invercargill; but at Dunedin many men are out of work. The engineering trade is fairly well employed, especially at Westport and Timaru, and for blacksmiths and boilermakers at Auckland, but at Dunedin many are unemployed. Flax and saw mills have been busy in several places. There has been plenty of work for unskilled labour at shearing and harvesting.

South Africa (Cape Colony).—No one is now allowed to land in South Africa without a permit. This must be applied for at the Permit Office, 47, Victoria-street, London, S.W. The applicant must possess £100, or prove that he is in a position to maintain himself in South Africa. Applicants living within fifty miles of London must apply in person. These permits are no guarantee that the holders will be allowed to proceed inland. The Permit Office does not include persons wishing to go out to farm, without any definite farm in prospect, amongst those having knowledge of a trade or profession. There is a good demand for skilled mechanics in many places. (Natal).—With reference to the demand for mechanics in Natal, which was mentioned last month, the Agent-General has already received applications for passages from a far larger number of carpenters, bricklayers, plasterers, masons, and painters than he has authority to send to the colony. There have been disputes in the building trade at Pietermaritzburg on the question of wages. These have been settled by raising the wages of carpenters and joiners to 15s. a day, instead of 14s. Carpenters and coachbuilders in the railway workshops are agitating for increased pay, partly on account of the increased cost of living. There is still a large demand for labour in the colony, especially in the building trades, but emigrants must remember that they must pay their own passages, that the cost of living in Natal is now high, and that they will not be allowed to land unless they first obtain a permit from the Permit Office, 47, Victoria-street, S.W. (Orange River Colony and Transvaal).—Although the output of gold in the Transvaal is increasing, only refugees, Government employees, and persons engaged in a service of a public nature will be permitted to proceed to the Transvaal. Candidates for the South African Constabulary should apply to The Recruiting Officer, S.A.C. Recruiting Office, King's-court, Broadway, Westminster, S.W.; they must be good riders, good shots, single, strictly sober, and from 20 to 35 years of age; they will be given free passages to South Africa. Farriers also are wanted for this Force.

EMIGRATION AND IMMIGRATION.

**** The Imperial Institute acts in concert with the Emigrants' Information Office (which is under the direction of the Colonial Office), of 31, Broadway, Westminster, S.W.; and also with the British Women's Emigration Association, now temporarily carrying on its work in rooms at the Institute. The Handbooks and Quarterly Circulars issued by the Emigrants' Information Office may be obtained at the Commercial Intelligence Office. Special information and practical advice respecting Canada and Cape Colony will also be furnished by the Curators of these Sections.**

UNITED KINGDOM.

Alien Immigration (Royal Commission).—It appears from the *Gazette* that the Royal Commission on Alien Immigration is to enquire into and report upon:—

(1) The character and extent of the evils which are attributed to the unrestricted immigration of aliens, especially in the metropolis.

(2) The measures which have been adopted for the restriction and control of alien immigration in foreign countries and in British colonies;

And to advise what remedial or precautionary measures it is desirable to adopt in this country, having regard to the above matters and to the absence of any statutory power to exclude or expel any individual alien or class of aliens from its borders.

The Commissioners are Lord James of Hereford, Lord Rothschild, the Hon. Alfred Lyttelton, K.C., Sir Kenelm Edward Digby, K.C.B., Under Secretary for the Home Department, Major W. E. Evans-Gordon, M.P. for Stepney, Mr. Henry Norman, M.P., and Mr. William Vallance, clerk to the Guardians of Whitechapel. The Commission is invested with the usual powers to examine witnesses and call for documents.

British Women's Emigration Association.—The hon. secretary of the British Women's Emigration Association reports 497 applications in the month ended March 21. An alteration has been made in the dates of the Protected Parties to Canada for this season, as s.s. *Vancouver* has been transferred from the Atlantic to the Mediterranean service. After the special parties in s.s. *Dominion* on March 27 and s.s. *Colonial* on April 16, the monthly parties with the matron will be sent in s.s. *Dominion* on May 1, June 5, July 17, August 21, September 25, October 30.

Some young men have been advised to join the personally conducted parties to the North-Western Territories, planned by the Manitoba Government, for April 3, 15 and 22, May 1 and 13.

The fifth annual report of the Girls' Home of Welcome at Winnipeg has just come to hand. During the season 676 inmates passed through the Home. A party for Australia will sail under especially good escort in s.s. *Austral* at the 17 guinea rate, deck cabin. The next group for the Cape will leave by s.s. *Galatea*, April 19.

Progress is being made in the way of the reception of young women in Rhodesia by the provision of a hostel at Salisbury, where they can lodge on their arrival until suited with employment. A hostel is very much needed at Durban, and the South African Committee of the British Women's Emigration Association is anxious to help the local committee to open one there.

A well-attended meeting of the South African General Committee and their friends was held at 20, Arlington-street, by the kind permission of Lord Salisbury, on March 19. The Lady Knightley of Fawsley, chairwoman of the South African Expansion Committee, in her opening words, explained that the committee was the outcome of Mr. Chamberlain's speech at the annual meeting of the British Women's Emigration Association a year ago. It had worked hard during the ten months of its existence, and had formed sub-committees for each separate territory in South Africa, to obtain information, and keep in touch with leading persons in each colony.

Mrs. Fawcett said she had returned from South Africa strongly impressed with the importance of sending out British women.

Mr. Asquith, M.P., spoke of ignorance having been one of the chief causes of the difficulties we had had to contend with, and no greater boon could be conferred than to send out an increasing supply of well-qualified teachers.

Mr. Evelyn Cecil, M.P., one of the treasurers of the Special South African Fund, gave some statistics of the work done since the Committee was formed in May last, and mentioned that a donation of £500 had recently been received from Messrs. Rothschilds.

It was announced that the Annual Meeting of the British Women's Emigration Association would take place on Thursday April 24, at 4 p.m., Lord Selborne in the chair. The annual report to be presented on that occasion gives the following details:—The number of applications in the year, 3,851; the number of persons who emigrated through the Association during 1901 was 458; these were distributed as follows:—To Canada, 141; South Africa, 196; Australia, 85; New Zealand, 13; United States of America, 5 (the balance, 18, is children included in families). Sixty-five cases had help from the Loan Fund; eighteen loans were repaid in full during the year, the others are being repaid.

The scheme for opening a "British Women's Hostel" in London is progressing satisfactorily. Negotiations are proceeding for renting a good house within easy reach of Euston and the other principal railway stations. £200 has already been promised towards the Guarantee Fund, and donations for initial expenses amount so far to £93. Furnishing is likely to cost £300, and assistance may be given either in the form of gifts now, or promises of subscriptions, or help towards the Guarantee Fund. Contributions will be received and acknowledged by Susan, Countess of Malmesbury, 113, Queen's-gate, London, S.W., or may be sent to the hon. sec., British Women's Emigration Office, Imperial Institute.

Emigration from Ireland.—According to the emigration statistics of Ireland the emigration rate for last year was nine per 1,000, a slight decrease as compared with the previous year. Of the total—39,870 persons—18,343 were males and 21,527 females, as compared with a total of 47,107 in 1900.

Of the 18,343 males who emigrated, 1,806, or 9.8 per cent., were returned as married men or widowers; and of the 21,527 females enumerated, 2,958, or 13.7 per cent., were described as married or widowed. Of the 16,927 persons between the ages of twenty and twenty-five years, 245 only were married—44 males and 201 females.

Of the 39,613 natives of Ireland who emigrated in 1901, 33,349, or 84.2 per cent., went to the colonies or to foreign countries; and 6,264, or 15.8 per cent., to Great Britain. The United States of America absorbed 31,942, or 80.6 per cent., of the number of these emigrants in 1901, compared with an average of 32,453, or 85.8 per cent., for the four preceding years.

CUSTOMS TARIFFS.

UNITED KINGDOM.

Drawback on Export of Castor and Icing Sugar.—According to a General Order (No. 12 of 1902) recently issued by the Commissioners of H.M. Customs for the guidance of their officers, castor and icing sugar made in the United Kingdom from duty-paid foreign refined sugar may be exported on drawback, as well as that made from home refined sugar, subject to compliance with the regulations as to shipment laid down by General Order No. 65 of 1901. Copies of both the 1901 and present Orders may be seen by those interested at the Commercial Intelligence Branch of the Board of Trade, 50, Parliament-street, S.W., any day between the hours of 10 a.m. and 5 p.m.

COLONIES.

Australian Commonwealth.—The *Commonwealth of Australia Gazette*, dated 24th January, 1902, contains a Customs By-law, issued by the Department of Trade of Customs on the 23rd January last, notifying that the following machine tools used in the undermentioned industries are admitted into the Commonwealth free of duty:—

MACHINE TOOLS.

Bookbinding.

Backing, bench presses, bevelling, binding, blocking, book-rolling, book-rounding, case-rolling, case-cleaning, case-making, cutting, eyeletting, embossing, finishing press and stand, folding, glueing, indexing, laying presses, nipping presses, numbering, paging, paring, perforating, punching, ruling, scoring, stand presses, stapling, trimming, wire-stitching machines.

Bootmaking.

Accessories to stitching machines being Gem insole, insole trimming, stitch separating, turn moulding, welt beating, button fastening, channel openers, counter moulders, hooking, pattern cutting and grading, pegging, power hammer, pricker (four-stitch), rand compressing, rand splitting, rand turning, sole rounding, standard screwing, staple fasteners, strap (printing and covering), treeing, tying (shoe), upper blocking and cleaning, vamp beading, folding and marking.

Brushmaking.

Boring, cutting, filling, flue or bottle brush machine, shaping, trimming.

Glassmaking and Working.

Patent presses, roughing mills, sandblasting.

Hatmaking.

Hydraulic blocking press for making straw hats.

Indiarubber Working.

Hose machines, steel stamps, steel tire mandrills, spreading thread drums, washer cutting.

Metal Working.

Arbor or mandrel presses, cutter making, Machine tools for electrotyping, stereotyping, and photo engraving, viz., backing presses, bevelling, casting moulds, curved cutting-off cylinder, curved finishing cylinder, curving for electroplate, electrotyping, hydraulic moulding presses, matrix rolling, plate thinning, shaving, squaring, trimming, facing, flanging, horseshoe, mitring, nail making, measuring machines, profiling, riveting, rivet making, straightening, type-casting and finishing machines, washer making, welding, wire netting.

Paper Finishing, Cutting, and Folding.

Bending and creasing—cutting, viz., card, guillotine, label, lever, millboard, rotary cutting and grooving, rotary cutting and scoring—damping, envelope making, glazing and hot rolling, labelling, machines for coating and finishing, paper bag and paper box making, varnishing paper, wrapping.

Stone Working.

Litho stone grinding.

Tile, Pipe, and Brick Making.

Blungers, filter presses, grinding mill for enamels, colours, glazes, and flint, magnetiser, moulding machines, press stamps, sifters, still, spur, and thimble presses.

Bermuda.—CUSTOMS TARIFF.—The Bermuda Supply and Appropriation Act, 1901-2 (No. 2 of 1901), providing for the imposition of duties on articles imported into the colony during the year ended 30th June, 1902.

The present Act re-imposes all duties previously in force except that certain articles which have hitherto been liable under the "unenumerated" rate to a duty of 5 per cent. *ad val.*, are now separately distinguished in the Tariff, and are liable to duty as follows:—

Articles.	Import Duty Leviable.
Eggs	3d. per dozen.
Poultry, dead	10 per cent. <i>ad valorem</i> .
Bananas, from 1st December to 1st June	Free.
Articles, the property of any foreign or British Colonial Government imported into these islands for use at or in connection with any establishment or institution in these islands maintained by such Government, solely for scientific purposes, on proof to the satisfaction of the Receiver-General that such articles have been so imported	"

Canada.—TARIFF AMENDMENTS, BY ORDERS IN COUNCIL, DATED 12TH AND 13TH FEBRUARY, 1902.—The *Canada Gazette* of the 22nd February last contains certain Orders in Council, notifying that the following articles may, in pursuance of the provisions of the Customs Act, be imported into Canada free of duty:—

1. Silver tubing, when imported by manufacturers of silverware to be used in their own factories in the manufacture of silverware.

2. Steel castings in the rough for the manufacture of scissors and hand shears, when imported by manufacturers of scissors and hand shears to be used in making such articles in their own factories.

3. Materials which enter into the construction and form part of cream separators, when imported by manufacturers of cream separators to be used in their own factories for the manufacture of such articles.

4. Yarns of jute, flax or hemp, for the manufacture of towels, when imported by the manufacturers of jute, linen or union towels, to be used in their own factories for the manufacture of such articles.

5. Steel, for the manufacture of cutlery, when imported by manufacturers of cutlery to be used in their own factories for the manufacture of such articles.

6. Hemp bleaching compound, when imported by manufacturers of rope to be used in their own factories for the manufacture of rope.

REDUCTION OF DUTY ON PRINTING PAPER.—The same *Gazette* contains an Order in Council, dated 11th February, 1902, reducing, under the provisions of sub-section 3 of section 18 of "The Customs Tariff, 1897," the Customs import duty on news printing paper in sheets and rolls, including all printing paper valued at not more than 2½ cents per lb., from 25 per cent. *ad val.* to 15 per cent. *ad val.*

[NOTE.—If the "printing paper" so imported enjoys the benefits of the British Preferential Tariff Act, a further reduction of one-third of the duty is allowed.]

New Zealand.—EXPORT DUTY ON TIMBER.—The "Timber Export Act, 1901" (No. 63 of 1901), dated 8th November, 1901, empowers the Governor to levy, by Order-in-Council, a duty on various kinds of timber exported from New Zealand, as follows:—

	Export Duty.
Logs, round	s. d.
Logs, square with axe or saw	3 0
Half-logs	per 100 superficial feet.
Hitches of any particular kind, or pieces of such size as the Governor by Order-in-Council from time to time determines	"

Provision is also made in the Act for the master or agent of every ship in which it is intended to ship for export timber liable to duty, to give not less than 24 hours' notice to the Collector or other proper officer of Customs of such intention, and in such form as the Commissioner may direct by regulation.

FLAX TO BE GRADED BEFORE EXPORTATION.—The "Flax Grading Act and Export Act, 1901," provides that:—"No flax shall be shipped or placed on board any ship for exportation to any place beyond New Zealand unless it has been inspected by an officer duly authorised in that behalf, and graded by him according to regulations made by the Governor under this Act."

St. Christopher and Nevis.—Ordinance (No. 16 of 1901), assented to by the Administrator on the 17th December, 1901, provides that the following Ordinances shall be continued in force until the 31st December, 1902:—

1. *The Additional Customs Tariff Ordinance, 1896* (No. 5 of 1896)* imposing an additional import duty of 1s. 6d. per barrel on wheat flour, 20 per cent. additional on the present duties on alcoholic liquors, and 10 per cent. additional on the present duties on all other articles subject to duty.

2. *The Export Duty Ordinance of 1898* (No. 1 of 1898), imposing export duties on sugar and rum, as follows:—

	s. d.
Sugar, per hogshead, not above 42 inches truss	4 8
" " tierce	3 2
" " barrel	0 6½
" in other packages	per ton 4 8
Rum, per 100 gallons	3 6

* It was provided by Ordinances Nos. 5 of 1898 and 6 of 1900, that the additional duties imposed by Ordinance No. 5 of 1896 should not apply to petroleum and its products, ale, beer, porter, stout, perry, cider, brandy, whisky, tea, leaf tobacco (if imported in packages containing not less than 500 lb.), manufactured tobacco and snuff.

EXCISE DUTY.—A copy of an Ordinance (No. 15 of 1901) has also been received, continuing until the 31st December, 1902, the "Rum Duty Ordinance, 1896," by which an additional duty was imposed of 20 per cent. on the duty of 3s. per proof gallon leviable upon rum manufactured in the Presidency.

St. Lucia.—FREE IMPORTATION OF CERTAIN ARTICLES.—An Order in Council, dated 27th December, 1901, notifies that the Governor has, with the approval of the Legislative Council, added the following articles to the table of exemptions from import duty in the second schedule to the Customs Tariff Ordinance, No. 12 of 1895:—

1. Alcohol (pure), chemicals, materials and apparatus imported exclusively for medical or other scientific investigations, upon a statutory declaration being made to the satisfaction of the treasurer that they have been so imported.

2. Blood stock, imported for breeding purposes or for improving the breed of animals in the colony, upon a statutory declaration being made to the satisfaction of the Governor in Council as to the qualities of such stock.

Trinidad and Tobago.—AMENDED IMPORT DUTIES.—A copy of a resolution passed by the Legislative Council on the 3rd February amends the rates of duty imposed on certain

articles imported into the colony under the Customs Tariff Ordinance, No. 18 of 1895, as follows:—

	Rate Import Duty. s. d.
Bread of all kinds, per barrel not exceeding 60 lb.	1 0
Vermicelli (including macaroni), per 100 lb.	2 0
Candles, per 100 lb.	2 2

DRAWBACKS.—Section 4 of the above-mentioned Ordinance is amended by providing for a drawback of duties upon exportation of the above articles, and provision is also made for a drawback of duties on the exportation of the following articles manufactured in the colony, if the Collector of Customs is satisfied that they have been made from imported materials:—

	s. d.
Hard bread or crackers, per barrel of not less than 60 lb.	1 0
Vermicelli (including macaroni), per 100 lb.	2 0
Candles, per 100 lb.	2 2

INDIA.

Countervailing Duty on Sugar from Holland.—Customs Circular (No. 5 of 1902), issued by the Finance and Commerce Department of the Government of India on 7th February last, revises the rate of *additional* duty on bounty-fed sugar imported into India from Holland, with effect from 1st March, 1902, as follows:—

Kinds of Sugar.	Additional Duties Levied.	
	Old Rate.	New Rate.
	R. a. p.	R. a. p.
Raw sugar produced in Holland from beet-roots . . . per cwt.	0 15 3	0 14 0
Sugar refined from beet-root sugar produced in Holland . . . per cwt.	1 1 5	0 15 11
Sugar refined from imported raw sugar per cwt.	0 2 3(a)	0 1 11(a)

(a) In addition to countervailing duty, if any, on the raw sugar.

FOREIGN COUNTRIES.

France.—IMPORT DUTIES ON "COLONIAL PRODUCE."—With reference to the French import duties on "colonial produce," a Law, dated the 22nd February, 1902, has been published in the *Journal Officiel*, of which the following is a translation:—

Article 1.—The Government is authorised to accord provisionally, by Decree, the application of the Minimum Tariff for "colonial produce" to imports from:—

(i.) China, Corea, Siam, Abyssinia, Liberia, Hong Kong, the Straits Settlements, and the Federated Malay States, so long as French merchandise enjoys equivalent advantages and most-favoured-nation treatment in these States or territories; and (ii.) For the period of one year, commencing on the 24th February, 1902, to imports from the United States of America, Porto Rico, Guatemala, Nicaragua, Honduras, British India, Ceylon, Mauritius, Seychelles, Jamaica, the Dutch East Indies, German possessions in Africa, and the Spanish possessions of Fernando Po, Annobon, Corisco and Elcbe, and on the Western Coast of Africa.

Article 2.—"Colonial products" admitted into Customs warehouses as being the produce of a country enjoying the Minimum Tariff at the time of entry into a warehouse shall benefit by the application of that Tariff on their removal, even when the country of production has in the interval become subject to the operation of the General Tariff.

Russia.—ARTICLES WHICH MAY BE DECLARED BY NUMBER IN INSPECTION DOCUMENTS.—An Annex to the new Russian Customs Regulations, contains a list of articles which, while subject to duty according to weight, may be declared by number in the "inspection documents" referred to in those regulations.

The following are the articles named in this list:—

Tariff No.	Articles.
58 (1) b	Wood, of common kinds, in blocks, in beams, hewn or sawn (exceeding 2 in. in thickness).
58 (1) c	Wood in planks and scantlings (exceeding 1 in., and not exceeding 2 in. in thickness), not planed.
58 (2)	Wood, of superior kinds, in scantlings, billets, and boards.
59 (1)	Wooden wares, having carpenters' finish.
59 (2)	Barrels.
61	Furniture, of all kinds (except detached parts), whether upholstered or not.
66 (3)	Stone slabs, scantlings, grind and polishing stones of natural grindingstone, whether worked or unfinished.
66 (4)	Stone slabs, sawn or split, without further finish; slabs cut in squares or rounds; stones with sawn unfinished surfaces; blocks of a thickness exceeding 5 vershoks (8½ in.).
66 (5)	Similar slabs of a thickness not exceeding 5 vershoks (8½ in.).
66 (6)	Millstones in the form of grey stones or of grindstone.
72 (1)	Common bricks.
72 (2)	Fire bricks; roofing tiles without sculpture or ornamentation; slabs of fire clay; stock bricks.
73	Earthen drainage or water pipes.
74 (1)	Stove tiles and ornaments; glazed bricks and tiles; clay slabs for paving or walls, of uniform colour.
159	Firearms (not including accessories for firearms).
167	Sewing machines, complete, put together.
172 (4)	Musical instruments of all kinds (not including appurtenances for musical instruments).
209 (7)	Ladies' hats and other head-dresses of all kinds, trimmed.
210 (3)	Leather and lacquered hats.

* A translation of these regulations has been published as No. 569 of "Miscellaneous Series" of papers issued by the Foreign Office.

Spain.—PAYMENT OF IMPORT DUTIES ON CERTAIN ARTICLES IN GOLD.—The *Gaceta de Madrid* for the 23rd February contains the text of a new Spanish Law, which received the royal assent and was to come into operation on the 1st ult., requiring the payment in gold of Customs' duties upon certain

articles upon their importation into Spain. The following are the chief provisions of the Law as now enacted:—

Article 1.—All the articles of exportation and the duties on importation on the merchandise comprised in the following sections of the Tariff shall be paid in gold:—

Tariff No.	Articles.*
6	Coal and coke.
8-10	Petroleum and mineral oils.
11	Oleonephthas, mineral lubricating oils, vaselines, and mixtures of these products with animal or vegetable oils or greases.
12	Benzine, gasoline, and other similar products.
306	Coaches and berlins with four seats, and light carriages with two "tableros" and boxes, with or without hoods; new, used, or repaired.
307	Berlins with two seats, with or without folding seats; omnibuses with more than 15 seats, and diligences; new, used, or repaired.
308	Other two or four-wheeled carriages, without "tableros," with or without hoods, without regard to number of seats; omnibuses up to 15 seats, and carriages not specified in the preceding classes; new, used, or repaired.
316	Steel or iron or composite vessels, of any tonnage.
324	Cod and stockfish.
325	Fish powder.
332	Wheat.
333	Wheat flour.
336	Cereals not separately tariffed.
342-3	Cocoa in the bean, not roasted, and cocoa husks, of any origin.
344	Cocoa, roasted, ground, or in paste; also cocoa butter.
345-6	Coffee, in the bean, not roasted, of any origin.
347	Coffee, roasted, ground; chicory, roasted or not, and other similar products.
348	Cinnamon of all kinds, and imitations thereof.
349	Pepper, cloves, and other spices, and imitations thereof.
350	Tea, and imitations thereof, and yerba maté.
355-9	Wines of all kinds, in barrels or in bottles.

* Articles which were not named in the Bill as originally introduced into the Cortes are printed in *italic* type.

Article 2.—A reduction shall be allowed in payments of the above-mentioned duties corresponding to the average rate of exchange on foreign countries. By "average rate of exchange" is meant the premium in Madrid upon bills at sight on Paris, according to the "Bulletin of the Madrid Bourse," in the period preceding that in which payment of the import or export duties is effected. The Minister of Finance shall fix, on the 15th and on the last day of each month, the said average rate of exchange, and the reduction to be made on payments of duties during the succeeding period; these rates of exchange to be published in the *Gaceta de Madrid*.

Article 3.—In the payment of duties in gold the following are to be admitted at their full face value:—

Gold coins of Spanish currency.

Gold coins of the countries forming the Latin Union.

Bank notes of the Bank of France.

Bills of exchange or cheques on Paris, London, Brussels or Berlin, provided they are made payable in francs, pounds sterling, francs, or marks respectively, and are duly guaranteed.

Article 4.—In the payment of duties in gold the fractional sums of less than 10 pesetas may be paid in Spanish currency, which will be taken at its full nominal value.

Article 5.—Payments paid, or to be paid, in virtue of the Royal Decree of 30th November last are to be considered as definite.

Regulations under the above Law.—According to a Royal Order containing regulations for the carrying out of the above Law, which appears in the same issue of the *Gaceta de Madrid*, the rate of reduction applicable to the payment of duties upon goods imported into Spain will be that in force at the date of the shipment of the goods for Spain.

The complete text (in Spanish) of the Law, and of the Royal Orders containing regulations applying its provisions, may be seen by those interested at the Commercial Intelligence Branch of the Board of Trade, 50, Parliament-street, S.W., any day between the hours of 10 a.m. and 5 p.m.

TRANSPORT AND FREIGHTS.

The Freight Market.—Outward market continues weak at last rates, with the exception of one or two directions, where charterers have had to pay up to secure tonnage for a market which is absolutely lifeless homewards. Last fixtures have been on basis of 6s. Genoa, 4s. 9d. Malta, 7s. Adriatic, 5s. 9d. Constantinople, 5s. 9d. Port Said, 6s. 9d. Las Palmas, 13s. Buenos Ayres or Rio. American markets continue weak, with a downward tendency. Australia quiet, with less demand. Newcastle-Manila paid 12s. There has been some time chartering at 6s. foreign, 7s. to 7s. 6d. coasting. Black Sea weaker, with very little cargo available. Eastern markets have relapsed and current rates are on the basis of 13s. 6d. Bombay, 22s. 6d. Calcutta, and 22s. 6d. Rangoon. Mediterranean markets continue extremely dull. United States done at 22s. 6d. from Sicily and 10s. from Spanish ore ports. River Plate has collapsed, owing to the excessive quantity of tonnage available.—WEDDELL, TURNER & CO., March 21st, 1902.

UNITED KINGDOM.

Bristol.—NEW AVONMOUTH DOCKS.—On Wednesday, March 5, the Prince and Princess of Wales cut the first sod of the new dock, which is to be constructed at Avonmouth at a cost of about a million and three-quarters sterling. Mr. Howell Davies, in asking the Prince's acceptance of a silver model of the steam "navy" with which the first sod was to be cut, said that the undertaking included a new dock of 30 acres, capable of expansion hereafter, and a graving dock 850 feet long. The approach would be by a lock 850 feet in length and 85 feet in breadth, with a depth on the sills of 36 feet at high water of ordinary neap tides. The dock wharves would be equipped with the most efficient type of sheds, cranes and elevators, and would be connected by sidings with the Great Western and Midland Railway Companies' systems. The terminal and siding arrangements would be of the most modern character, for dealing rapidly and economically with the cargoes of vessels up to 20,000 tons capacity. He maintained that Avonmouth, for the Atlantic passenger traffic, had advantages over even such favoured ports as Liverpool and Southampton, in that coal could be obtained at lower cost and because of its central position in the country. The Prince of Wales was then conducted to

the steam navy, and he set the machinery in motion by means of a lever. The Prince and Princess afterwards visited the *Port Royal*, which had just arrived from Jamaica with bananas and other fruit.

COLONIES.

Cyprus.—ABOLITION OF SHIPPING DUES.—With reference to recent legislation as to shipping dues in Cyprus, attention is called to the fact that, except in the case of sailing vessels which choose to compound by a lump payment of a shilling a ton every half-year, no duty is now levied on a ship's tonnage, but charges are made on certain imports and exports. Particular attention is directed to the fact that only wharfage charges on goods landed or shipped are now levied, and that the shipping dues have been abolished.

Lagos.—RAILWAY TARIFF.—All goods, not including agricultural produce, are divided for railway transport into three classes for the purpose of fixing the rates at which they are carried. The following are the rates fixed for the three classes:—

Class I.	9d. per ton per mile.
Class II.	6d. " "
Class III.	3d. " "

A rebate of 7½ per cent. is allowed to any consignor who forwards a consignment of not less than 10 tons, and 10 per cent. for a consignment of not less than 15 tons.

FOREIGN COUNTRIES.

American Trade in the Levant.—The *Times* correspondent, at Vienna, writes, under date February 26:—One of those instructive reports on economic affairs in the Levant periodically published by the *Deutsche Zeitung*, of Vienna, appears in to-day's issue of that journal. In presence of the pending exchange of civilities between Germany and the United States, the following facts are of special interest. According to the report in question, two Hamburg shipowning firms have organised a direct steam navigation service between New York and Constantinople. The first steamer of this line will have arrived at Constantinople within the last few days. This new enterprise has been undertaken jointly by the German Levant line and the Hamburg-American line. A few years ago the Americans themselves attempted to establish a direct service between New York and Constantinople, but eventually gave it up. American merchandise destined for the Levant is forwarded almost exclusively *via* England by means of transshipment, which naturally increases the cost price. It is certain that the venture of the two Hamburg shipping firms will pay well. South Russia and Turkey import from America more especially agricultural machines, small ironware, textiles, etc. Those two countries export to America metallic ores, hides, carpets, opium, currants, etc. The amount of freight will increase in the same proportions as the demand for American goods.

The Americans have been making great efforts to gain a firm footing in the markets of the Levant, but hitherto they had met with some difficulty, not only on account of reluctance on the part of Eastern traders to comply with their commercial usages, but also owing to the absence of a direct steamer service. Now that the latter hindrance has been removed, it is expected that the Turkish markets will receive large quantities of American merchandise. But as the consumption among the native population increases very slowly, it is evident that the imports from other countries will suffer from American competition. German industry will also be affected, but on the other hand the Hamburg shipowners will be the gainers.

France.—PORT WORKS.—The following are some particulars relating to the improvements projected and in course of progress at the principal French ports, extracted from a report drawn up by M. Aimond, Deputy, on the improvement of the canals, rivers, and ports of France:—

Dunkirk.—At Dunkirk the entrance to the port is being dredged, the outer port is being enlarged, dockyards are being constructed, and the graving docks are being repaired. A building for the service of the port is also in course of construction, as well as a tidal wharf. The expenditure during 1901 was estimated at 2,500,000 francs (£100,000). The projected works, including the lengthening of wet docks Nos. 3 and 4 of the Freycinet basin, the displacement of the fortifications, and the acquisition of the land required for the future enlargement of the port, will entail an expenditure of 26,000,000 francs (£1,040,000).

Dieppe.—At Dieppe the tidal harbour is being dredged, a sum of 150,000 francs (£6,000) being credited for this work during 1901. The projected works include the improvement of the entrance to the port at a cost of 4,900,000 francs (£196,000), and various works in connection with the fishing industry to cost 920,000 francs (£36,000).

Havre.—At Havre it is proposed to construct a lock to provide communication between the Bellot dock and the new quays of the Tancarville canal, and also a railway siding. Other works projected are the lengthening of the Eure basin, the construction of quays, and the re-construction of the large quay to the north of the present outer port. These works are estimated to cost 20,000,000 francs (£800,000).

Nantes.—It is estimated that a sum of 22,000,000 francs (£880,000) will be required to open the port of Nantes to vessels having a draught of over 5'25 metres.

Bordeaux.—As regards Bordeaux, it is estimated that a sum of 13,000,000 francs (£520,000) will be required for the construction of another floating dock and of a graving dock.

Besides those enumerated above, proposals are made for improvement works at other ports, viz., Boulogne, Cette, Bayonne, etc.

Madagascar and Réunion.—Messrs. Charles Strecker Aine, of Antwerp, are establishing a regular service with first-class French steamers from Antwerp to Marseilles, Madagascar-Réunion (Diego Suarez, Majunga, Mananzary, Tamatave, St. Denis), and Point de Galle. The pioneer steamer (the *Montaigne*) leaves Antwerp on 31st March.

Roumania.—THE PORT OF CONSTANTZA.—The Braila correspondent of the *Levant Herald* says, with reference to the importance of Constantza as a grain-exporting centre, that never before has so much business been done at that port as at the present time. Grain is being shipped on an extensive scale, more particularly maize and barley, for which the demand from England and Italy is daily increasing. Improved appliances have been introduced in the new harbour, and loading operations have been greatly facilitated. The Administration of State Railways has laid new lines on the quays, so that steamers coming alongside can load direct from the waggons. In the completed portion of the new harbour there is berthing room for 15 steamers.

United States.—REDUCTION IN PORT DISINFECTANT CHARGES AT NEW ORLEANS.—H.M. Consul at New Orleans reports that at a recent meeting held at the State Board of Health, the following reduction was made in the disinfection charges at New Orleans, to take effect immediately:—

Steamers from 130 dols. to 105 dols.
Vessels from 80 dols. to 65 dols.
Barques from 60 dols. to 50 dols.

The above means nearly a 20 per cent. reduction.

SHIPPING FACILITIES AT PORTLAND (MAINE).—The British Vice-Consul at Portland (Maine), in his recent report, writes as follows:—"I again beg to draw attention to the facilities now afforded by the various steamship lines for direct shipment to Portland of all merchandise destined for Maine and adjoining States, etc. The rapidity with which merchandise can be cleared through the Custom-house, and the saving in storage and other expenses of this port, should have an important influence in obtaining 'repeat' orders."

OFFICIAL AND COMMERCIAL CONTRACTS.

UNITED KINGDOM.

Devonport.—TENDERS are invited, until the 16th inst., for the SUPPLY of MATERIALS and the EXECUTION of the following WORKS:—(a) Permanent way, road-bed, paving and bonding of 3 m. 1 f. 2'08 ch. of double TRAMWAY TRACK, and all incidental and special works. Particulars (£20) may be obtained from Mr. C. Chadwell, 20, Victoria-street, Westminster.

Hull.—SPRINGHEAD PUMPING STATION.—TENDERS are invited, until the 26th inst., for the SUPPLY and ERECTION of one set of ENGINE and PUMPS, complete, for the Suburban High Level District. Particulars (£1) may be obtained from Mr. F. J. Bancroft, Alfred Gelder-street, Hull.

London (Admiralty).—TENDERS are invited, until the 9th inst., for the SUPPLY to H.M. Dockyards of RIGA and ST. PETERSBURG HEMP. Particulars may be obtained from the Director of Navy Contracts, Admiralty, London.

Manchester.—The Waterworks Committee invite TENDERS, until the 19th inst., for the SUPPLY of two sets of additional steam PUMPING ENGINES, to deliver against a pressure of 1,120 lb. per square inch. Particulars (£1. 1s.) may be obtained from the secretary, Waterworks Offices, Town-hall, Manchester.

Medway Conservancy.—TENDERS are invited, until the 8th inst., for the EXECUTION of certain DREDGING WORKS in the River Medway. Particulars (£2. 2s.) may be obtained from the secretary to the Medway Conservancy, 42, High-street, Rochester, Kent.

Tarporey.—TENDERS are invited, until the 16th inst., for the CONSTRUCTION of about two miles of PIPE SEWERS from 15-in. to 8-in. diameter, etc. Particulars (£10) may be obtained from Mr. C. E. Bruges, 1, Victoria-street, Westminster.

Tottenham.—TENDERS and DESIGNS are invited, until the 22nd inst., for a REFUSE DESTRUCTOR PLANT. Particulars (£10) may be obtained from Mr. W. H. Prescott, Coombes Croft House, 712, High-road, Tottenham.

COLONIES.

New South Wales.—PROPOSED BRIDGE ACROSS SYDNEY HARBOUR.—A further extension of time for tendering for the above, until June 30th next, is announced. Particulars may be obtained from the Agent-General for New South Wales, 9, Victoria-street, Westminster. (Newcastle).—The Government of New South Wales offers a concession of a 99 years' lease of a suitable floating dock site at the port of Newcastle to any responsible owner or company undertaking to build, equip and maintain a floating dock capable of accommodating vessels up to 5,000 gross tons. Tenders to be addressed to the Under-Secretary for Public Works, Sydney. Further particulars of the Agent-General for New South Wales, 9, Victoria-street, Westminster. Contract closes April 7. (Sydney).—Messrs. Preece and Cardew are authorised by the Municipal Council of Sydney to invite TENDERS, until the 7th May, for the SUPPLY, DELIVERY, and ERECTION of the PLANT and MACHINERY required for the complete equipment of their proposed Electricity Supply Station, and sub-stations in connection therewith. Particulars (£5) may be obtained from Messrs. Preece and Cardew, 8, Queen Anne's-gate, Westminster.

Victoria.—TENDERS are invited, up to the 14th inst., for the SUPPLY of STEEL RAILS and FISHPLATES for the Victorian railways. Particulars can be seen at the Contractors' Room, Spencer-street, Melbourne, and at the office of the Agent-General for Victoria, 15, Victoria-street, London, S.W. A preliminary deposit of £1,000 is required in each case.

INDIA.

Calcutta.—TENDERS are invited for the SUPPLY of 10,000 STOPCOCKS, as follows: 1,428 inch, 2,856 three-quarter inch, 5,716 half-inch. To be delivered c.i.f. Calcutta. The stopcocks are to be a strong pattern, gun-metal, with loose valve, square head on spindle, and a false spindle not less than $\frac{1}{8}$ in. square on all sizes. Stops to have male ends screwed for iron pipe. A pattern of each size is to be sent with tender, and when tender is accepted subsequent deliveries must be equal to the pattern, or the stops will be rejected. All stopcocks must be tested by the makers up to 500 ft. head water. The stopcocks should be delivered in equal monthly instalments, and tenderers should state the number of each size they are prepared to deliver each month, and when the first instalment can be delivered. Address, Fred. Gainsford, secretary to the Corporation. Contract closes April 23.

East Indian Railway.—TENDERS are invited, until the 9th inst., for the SUPPLY and DELIVERY of:—(1) Mining Tubs and Wheels and Axles for Colliery Trucks; (2) Buffers, Screw Couplings, etc. Particulars (£1. 1s.) may be obtained from the Company's Offices, Nicholas-lane, London, E.C.

State Railways.—TENDERS are invited, until the 15th inst., for the SUPPLY of WORKSHOP MACHINES. Particulars may be obtained from the Director-General of Stores, India Office, Whitehall, S.W.

FOREIGN COUNTRIES.

Argentina.—TENDERS are invited by the Commissioners for the Drainage Works of the Province of Buenos Ayres, for the construction of the necessary works in connection with over 620 miles of main drainage canals, branch trenches, and accessory works in certain regions subject to inundations. Contractors experienced in such work, and desirous of tendering, may obtain further information by applying in writing to the secretary, Argentine Legation, 16, Kensington Palace-gardens, London, W. No date for placing contract is announced.

Egypt.—TENDERS are invited, until the 7th inst., for the SUPPLY of 350 metric tons of PORTLAND CEMENT; also for the SUPPLY of 10,400 CROSSING SLEEPERS. Particulars of these two contracts may be obtained from Lieut.-Colonel J. H. Western, Broadway Chambers, Westminster.—TENDERS are invited, until the 8th inst., for the WORKING of the Abou Zaabel QUARRIES. Particulars may be seen at the Office of the Commission of Public Ways, Cairo.—TENDERS are invited, until the 20th inst., for the SUPPLY of two LIFTING WINCHES for Ziftah Barrage Regulator Gates. Particulars may be obtained at the office of the Inspector-General of Irrigation, Lower Egypt.—TENDERS are invited, until the 10th inst., for the SUPPLY and ERECTION at Alexandria of a HYDRAULIC PRESS, working pressure 2 tons per square inch, and provided with treble

hydraulic pumps for hand power. Particulars may be obtained at the Secretariat of the Egyptian Direction-General of Customs.

Norway.—TENDERS are invited by the Stavanger Waterworks for the DELIVERY and ERECTION of a PUMP driven by a GAS MOTOR. Tenders, marked "Leverance og Monterings af Pumpe og Gasmotor," can be sent in until the 15th inst., to Stadsingeniørkontoret, Stavanger, where drawings and conditions may be obtained.—TENDERS are invited by the Norwegian State Railways, until the 15th inst., for the SUPPLY of various TOOLS and MATERIALS for use on the Arendal-Aamli line. Particulars may be examined at the Commercial Department of the Foreign Office.—TENDERS are also invited by the Intendant of the Norwegian Navy, until the 12th inst., for the following OILS: 20,000 kilogs. sweet oil (not more than 8 per cent. acid), 30,000 kilogs. marine oil, 2,000 kilogs. castor oil, and 3,000 kilogs. lamp oil of good qualities. Conditions may be examined at the Commercial Department of the Foreign Office. Apart from Customs duties, the Norwegian Government give a preference of 15 per cent. to native tenders.

Spain.—TENDERS are invited, until the 10th inst., for the SUPPLY of 45,900 metres of JUTE SACKING for making 18,000 flour sacks. Particulars may be obtained in the Directorate of the "Subintendencia Docks," Madrid.—TENDERS are invited for the CONSTRUCTION of BRIDGES as follows, viz.:—Until the 8th inst., for a bridge across the Jadrachón creek, on the road from Alcalá de Guadira to Huelva, in the province of Sevilla, at the upset price of 38,997'44 pesetas, or about £1,135, a provisional deposit of 390 pesetas, or about £11, being required to qualify any tender; and, until the 10th inst., for a bridge over the Chartera "rambla," on the high road from Tarancón to Teruel, in the province of Teruel, at the upset price of 33,106'30 pesetas, or about £964, a provisional deposit of 1,700 pesetas, or about £49, being required in respect of any tender. Particulars may be seen at the Ministry of Public Works, Madrid.—TENDERS are invited, until the 10th inst., for:—The metal spans for the bridge over the Rivers Guisande Abadin and Tamoga, on the high road from Rabade to Moncelos, in the province of Lugo, at the upset price of 36,743'69 pesetas, or about £1,061. A provisional deposit of 1,900 pesetas, or about £55, is required. Constructing a bridge over the River Tormes, on the high road from Villacastin to Vigo, in the province of Salamanca, at the upset price of 841,640 pesetas, or about £24,394. Provisional deposit, 42,100 pesetas, or about £1,215. Constructing a bridge over the River Jucar, on the high road from Silla to Alicante, in the province of Valencia, at the upset price of 364,826'42 pesetas, or about £10,536. Provisional deposit, 18,200 pesetas, or about £526. Particulars may be seen at the Ministry of Public Works, Madrid.—TENDERS are invited, until the 8th inst., for the SUPPLY of 4,000 SUITS of LINEN DRILL to the Directorate of Penal Establishments, Madrid. Particulars may be seen in the *Gaceta de Madrid* of the 7th March.—The Alquefe Mines and Railway Co., Ltd., invites TENDERS, until the 21st inst., for the CONSTRUCTION of a STEEL PIER or LOADING STAGE in the Mediterranean, at Almeria, Spain, with MASONRY and STEEL APPROACH and contingent works, comprising about 2,800 tons of steelwork. Particulars (£3. 3s.) may be obtained from Messrs. Formans and McCall, 160, Hope-street, Glasgow; or of Mr. C. E. Bulmer, Alquefe Mines, Guadix, Spain. Mr. Bulmer will be in Almeria from 1st to 8th inst., to show intending contractors over the site.

COMMERCIAL LAW INTELLIGENCE.

A Burglary Loss.—Before Mr. Justice Kennedy a case of some importance to traders was heard, the question under consideration being the liability of a retailer in furs in respect to goods consigned to him on sale or return. The plaintiffs were Messrs. BEVINGTON AND MORRIS, leather merchants and furriers, and the defendants, Messrs. J. R. DALE AND CO. (LIMITED), tailors and costumiers. According to the admitted facts, in September, 1901, plaintiffs delivered a quantity of furs to the defendants' shop in Sloane Street, on what was known in the trade as "memo." or "appro." goods not sold to be returned at the request of either party, and the plaintiffs to be at liberty to send at any time for any particular article they might require. A burglary was committed at the shop, and furs of the invoice value of £168 were stolen. It was agreed that there was no negligence on the part of the defendants, and the question for decision was who was to bear the loss. For the plaintiffs it was urged that it was a perfectly well-known custom of the trade that the risk was on the consignee up to the time that the goods were either sold or returned, and a decision of Lord Field was quoted, given twenty-five years ago, when the jury found that the custom had been established. A number of wholesale furriers and retailers gave evidence of the existence of the custom. For the defendants it was contended that the retailer was only the bailee of the goods, and when he was deprived of them, through no negligence on the part of himself or anyone in his employ, the owner was the person liable. The custom suggested was not, he urged, proved, and it was not supported by or based on reason or the requirements of the trade. If the plaintiffs were right, the whole of the risk was borne by Dale, and the whole of the profits taken by Bevington and Morris. Mr. Justice Kennedy held that the custom had been proved, and that persons dealing in the trade must be taken to have knowledge of it. In the absence of custom, the bailment would bring no liability on the bailee, if there was no negligence. In this case, where articles of particular value were consigned by the wholesale house to the retailers on "memo." or sale or return, the latter took a wider liability while the goods were in his possession. It seemed a very reasonable custom, for, while the wholesale dealer would find it almost impossible to insure them unless he could get a floating policy without reference to warehouse or shop, the retailer would have little difficulty in doing so. Judgment for the plaintiffs, with costs.

Authority of Servant to Sell.—An action was brought by Mr. F. W. WARMINGTON, L.C.C., against Messrs. CHICK AND SON, a firm of jobmasters, for the return or value of a landau, and damages for its detention and wrongful user. It appeared that the plaintiff, on returning from a visit to Scotland in 1901, found that his coachman, one William Holding, had absconded, and that the landau was missing. It was then discovered that Holding had sold it to the defendants for £55. The defendants declined to return it except on receipt of that sum. They now pleaded that Holding either was the plaintiff's agent for the sale, or had been so held out by the plaintiff as his agent that he was estopped from denying the fact. It appeared that in 1898 and in 1900 Holding had acted as the plaintiff's agent for the sale to the defendant of a bay mare and a horse, and it was also pleaded that the plaintiff had allowed the landau to be in Holding's possession and to be offered by him for sale. The plaintiff, in his evidence, admitted that his habit was to leave the sale of such horses as he wished from time to time to sell in the hands of his coachman, fixing the price himself. He had once sold a carriage, but in that case sold it himself, and he had never even contemplated selling this one. He had never detected dishonesty on Holding's part before he absconded. It appeared that when Holding brought the landau and offered it to the defendant for sale he offered the horse and harness too. On his request he was paid by an open cheque to

himself for £54, and £1 in cash. It was contended on behalf of the defendant that it might reasonably be assumed that a coachman who had been allowed on two occasions to sell horses for his master had authority to sell a carriage. Supposing it had been a third horse that he had tried to sell, could it be said that he was not clothed with ostensible authority to sell it? His lordship remarked that it would be a serious thing to decide that because a man was allowed to sell horses he might be safely considered authorised to sell everything connected with them. The jury, after an absence of two hours, returned a verdict for the plaintiff, assessing the damages at £55. Judgment was entered accordingly, with costs.

The Sale of Bread by Weight.—The case of COX (on behalf of, etc.) v. BLEINES, which was heard in the Lord Chief Justice's Court, was an appeal from a decision of a metropolitan police magistrate, who had dismissed an information under the London Bread Act, alleging that the respondent had sold bread otherwise than by weight. Mr. Daldy, for the appellant, said the magistrate dismissed the information on the ground that the sale was by weight, and his contention was that there was no evidence upon which he could so find. The appellant, an inspector of weights and measures, sent someone into the respondent's shop, who asked for a half-quarter loaf. Thereupon defendant's servant placed a loaf and two rolls in one of the scales, the proper weight being in the other. The bread did not carry the scale down, and the beam did not move at all. The person, however, who had been sent into the shop paid twopenny, took the bread away, and the proceedings were instituted. The magistrate said he was of opinion that it made no difference whether the bread was properly or improperly weighed. He was, he said, of opinion that the bread was actually weighed.

Mr. Justice Channell: I should say it was a sale by false weight.

There was no appearance on the other side, and the Court allowed the appeal, and sent back the case to the magistrate.

Salmon Catching.—DAVIES v. EVANS was a case stated by the magistrates of Carmarthen, raising the question whether an intention to catch salmon was necessary to support a conviction for catching salmon during the weekly close time by means of a permanently fixed net, which though not a salmon net had, in fact, caught salmon during that period.

The following facts appeared from the case stated:—On August 3, 1901, two informations were brought by the respondent, James Evans, of Abergwili, a superintendent of water bailiffs in the employ of the Carmarthen Bay Board of Conservators, against the appellant, a fisherman named William Davies, under bye-laws made by the Board under 36 and 37 Vic. c. 71, section 39, sub-sections 2 and 4. The first information charged the appellant with unlawfully fishing for salmon otherwise than by rod and line at 4.30 p.m. on Sunday, May 25, 1901, during the weekly close time. The other charged him with attempting on the same occasion to take salmon with a net of less dimensions than allowed by the bye-laws. The justices convicted the appellant and fined him 10s. and costs, with the alternative of seven days' imprisonment on each charge. The informations were, by consent, heard together, and the following facts were proved. The appellant was the owner of a net in the estuary of the Towy, permanently fixed in position. The mesh was smaller than required by the law regulating the size of mesh for salmon nets, and the net was kept up during the weekly close time fixed by the bye-laws. Large quantities of coarse fish were caught and salmon occasionally. The defendant held a salmon licence in respect of the net. No bye-law had been made under 36 and 37 Vic. c. 71, section 39, sub-section 11. On the part of the appellant it was contended that the net was not peculiarly adapted for catching salmon and that it was not fixed for that purpose, and that the licence was taken out to enable him to keep any salmon that might occasionally be caught, and did not convert it into a salmon net so as to render it subject to the bye-laws. On the part of the respondent it was contended that the fact that the net was fixed in salmon waters and caught salmon, and that the appellant had taken out a licence in respect of it, brought it within the operation of the bye-laws. The question for the opinion of the Court was whether the facts that the net had been fixed in salmon waters and had taken salmon, and that the appellant had taken out a licence in respect of it, brought it within the operation of the bye-law as to weekly close time.

The Lord Chief Justice said that they were all of opinion that the case ought to go back to the justices, with a direction that the facts stated would be sufficient to justify a conviction if the justices found intention, but the intention was to be gathered from the facts. It would be no answer for the appellant to say that he had no intention. The intention was to be gathered from his conduct. Case remitted and costs to abide the result.

BRITISH CONSULAR REPORTS.

Colombia.—The British Vice-Consul in Colombia describes, in his latest report, the condition of Colombia after more than two years of civil war. He says that national industry is crippled and all commercial intercourse with the interior checked. The carriage of merchandise on the Magdalena river, the main artery of the internal trade of the country, has become all but impossible. The Government has done all that it could to protect the large British mining interests in the Tolima district, and the managers of the important mining establishments have thus been enabled to carry on their work in spite of the condition of the country. It is many years since all the specie was driven out of the country, and an inconvertible paper currency substituted. The value of this paper declined little before the present revolution, but since then it has fallen so that 312 pesos in November, 1898, would purchase the same amount of sterling that 4,800 pesos would in November, 1901. The consequence is the dislocation of trade at the ports. Thus, there have been cases in which a merchant would sell a large quantity of goods on a Monday. As bills in the market on that day stood at 2,000 per cent., he would guard himself and liquidate at 2,300 per cent. On the Saturday following he wishes to convert his gains of the week into gold, and finds that to buy drafts he has to buy at 2,700 per cent., so that his transactions of the week result in a considerable loss. Matters have come to such a pass that merchants are beginning to refuse to sell except to such as are able to pay in gold.

The gold and silver mining industry is chiefly in British hands. Some of the most important mines are rediscovered Spanish workings, one of these yielding as much as 1,000,000 oz. of fine silver in a year. Most of the silver mines are well provided with modern mining and milling machinery. The gold is both vein and alluvial.

The emerald mines of Muzo and Coscuez, the property of the Colombian Government, have produced the finest emeralds in the world. They are at present rented to a British company. Up to the year 1875 all the emerald mines in the country were the property of the nation. After that date the Government granted the right of exploration and working to private enterprise, reserving only the right to the Muzo and Coscuez mines. Since then several companies have been formed and considerable capital expended, with very poor results. The most promising of these seems to be the Somondoco mines, worked by a British company. The department of Boyacá, from a mining point of

view, is of a totally different geological formation to the other mining departments of the Republic, no gold or silver being found save in the few rivers emptying into the Magdalena. The one great mine of production is that of Muzo, famous since the year 1555 for the production of the finest emeralds of the world, a stone, in the rough, weighing 2,330 carats having been taken from one of the many veins of this mine. These mines are the property of the Colombian Government, who leases them for periods of five years to the highest bidder at public auction, which takes place in the capital of the Republic one year previous to the expiration of the term in force. The value of the production of these mines has always been kept a secret by the lessors.

Portugal.—COMMERCIAL CONDITION.—The British Commercial Attaché at Lisbon, in his last report, states that recent statistics show that the trade of Portugal continues to make considerable progress in spite of financial depression and colonial difficulties in Africa. The volume of trade is small, for the population is small; but imports and exports steadily increase, and the general condition of the country offers favourable prospects for the future. By nature Portugal is agricultural rather than industrial, but since 1891, when the protectionist movement began, Lisbon and Oporto have become surrounded by factories in which almost all classes of goods are now manufactured. The high Customs tariff has raised prices and greatly increased the cost of living; but the growth of these factories, though making life harder for the agricultural classes, has tended to raise wages and the standard of living, so that, in spite of high duties, the demand for foreign goods has increased.

There is still much for foreigners to do in Portugal. Lisbon and Oporto are large and flourishing cities demanding all the necessities of modern life. The country is in a backward condition, and the trade in wine and cork, as well as agriculture, is capable of further development, although they have already brought in large sums of money. Mining shows signs of being established on a profitable basis, and the investment of capital in tramways and public works shows a general advance in the prosperity of the country. The wine trade has suffered of late from over-production. The manufacture of good, cheap wines has only been seriously undertaken quite recently. Up to 1886 Portuguese wines, except port and Madeira, were used only at home, in the colonies, and the French wine factories, and there was no demand in Europe. But now the production of good wines, of the nature of claret and hock, is increasing, care is taken in their manufacture, the flavour and quality are excellent, and the wines are superior in many ways to others of the same price. These carefully-made cheap wines should make their way in the United Kingdom and compensate for any decline in the port wine trade that may occur in consequence of altered tastes. At present this trade receives as much support as ever in this country. Indeed, the general trade of the United Kingdom with Portugal continues to increase more in proportion than that of any other country. Mr. Harrison urges that this old-established trade connection deserves strengthening in every way. All the natural products of Portugal—wines, agricultural produce, and minerals—are wanted in the United Kingdom, and Portugal wants British manufactures. Good quality is important and has hitherto been a characteristic of British goods, and this should be industriously maintained.

FOREIGN CONSULAR REPORTS.

Artificial Fuel in Belgium.—The principal, and in fact practically the only, artificial fuel manufactured in Belgium consists of a composition of

COAL DUST

made in the form of large bricks, either solid or perforated, and used chiefly as fuel for steam engines, locomotives, etc. Small bricks are also manufactured in the form of cubes or of parallelograms, in round or oval balls, and are used in place of anthracite coal for stoves built on the American system. The material employed for the manufacture of these bricks is coal dust which has generally been previously washed. The glutinous element used in the composition is the residue from the distillation of coal tar, which residue is produced in large quantities by the manufactories for the distillation of tar obtained from the gas and coke plants. The bricks thus manufactured contain 94 per cent. of coal. The coal dust is usually obtained from what is called hard coal in this country (not anthracite) and from coal which is said to be one-fourth soft. In 1900, 1,395,910 tons of large and small bricks and balls were manufactured. In this amount is not included the production of some minor manufactories where small balls without tar residue are made from coal one-half soft. The materials used in these small balls are held together by injecting steam into the mass while it is being moulded and pressed. About 1,000 tons of these small balls, without tar residue, were manufactured in 1900. The average price at the manufactory of the large bricks and balls made with tar residue was, in 1900, 23.56 francs per ton. The commercial movement in these composition bricks of coal is rather important in Belgium, and is increasing every year. In 1900, the exportation amounted to 604,864 tons, as compared with 525,625 tons in 1899.

PEAT AND WOOD.

There exist in the north-west and also in the south-east of Belgium some small plants for the manufacture of fuel from peat. As the peat in Belgium is of rather an ordinary quality, containing a great deal of earth, sand, and other mineral products, it is used for fuel purposes only in the district where it is produced. There is no exportation of this product. There is a small amount of artificial kindling produced, which is made from sawdust and small bits of wood held together by a glutinous substance produced from the tar of the wood. This kindling is pressed into the form of bricks, which are grooved for the purpose of readily dividing them into four parts.—*United States Consular Reports.*

Cotton Goods in Smyrna.—The United States Consul at Smyrna states that the chief obstacle in the way of developing American trade is German competition. He learns that in many instances the Germans, to gain business, dispose of large quantities of goods at absolutely cost price and give long credits. More than this, they make articles which are especially adapted to this market. Their goods have an attractive appearance, but are of inferior construction and quality. Americans seem to be unable to meet English competition in cotton prints (an article of great importance in this country). The English goods are cheaper and conform to the requirements of this market. Local merchants say that cotton prints should be about 28 inches in width, the cheaper qualities 26 to 27 inches, and the better qualities 28 to 29 inches. The designs should be devoid of figures of animals; those of men, women, horses, dogs, or birds being especially objectionable. Flowers and vines are desirable in bright, gaudy colours, especially red and yellow or blue and green.

Pharmaceutical Specialities in Turkey.—Difficulties accompanying the introduction into the interior of Turkey of foreign pharmaceutical preparations, prompt the United States

Consul at Harput to call attention to the regulations regarding this class of imports. In an Imperial Order issued some time since concerning the sanitary examination of imports into the Empire, it is stated that the entrance of pharmaceutical specialities of unknown composition, or not meeting the requirements of the French pharmacopœia, is forbidden. An exception, however, is made in the case of such specialities of these two categories as have been approved by an "official academy" (*académie officielle*), i.e., a chartered medical society. In order to secure the entrance of an article of this nature, the importer is required to secure an authorisation from the Imperial Medical College at Constantinople. The latter requires that the demand for such authorisation should be accompanied by a certificate from the "academy" indorsing the article in question, and either a sample of the article or the formula of its composition, where there is a departure from the requirements of the French pharmacopœia. All the documents in the case should be certified by an Ottoman Consul in the country of origin. In order to avoid delays and difficulties the Turkish medical officials urge strongly that great care should be taken to secure proper Ottoman consular certification for all papers submitted in connection with such importations. Further, they call attention to the requirements that all formulas should be written either in French or Turkish. Quantities and proportions should be stated with the utmost clearness. The names of constituents employed should be those used in a purely scientific nomenclature, and not those customary in trade. In general, formulas and labels should be of such a character that they can be easily understood by official examiners possessing a very limited scientific knowledge and practically no familiarity with commercial terms. It is constantly to be borne in mind that Turkish officials look with exaggerated suspicion upon anything containing poisonous or explosive constituents. The extreme difficulty of securing potassium chlorate in Turkey for such an innocent use as a throat gargle is an example in point.

CHAMBERS OF COMMERCE REPORTS.

UNITED KINGDOM.

The Association of Chambers of Commerce of the United Kingdom.—The forty-second annual meeting of this Association was held on the 4th and 5th ult., at the Hotel Métropole, London. Lord Avebury, the president, in moving that the report and financial statement be adopted, said that when he last had the honour of addressing them he brought forward some figures which seemed to him to show that we need by no means take a desponding view of British commerce. He would now give them some different, though, as it seemed to him, very striking figures. The value of our total exports and imports was in 1860 £378,000,000, in 1870 £547,000,000, in 1880 £697,000,000, in 1890 £749,000,000, in 1900 £877,000,000. No doubt, however, there were dangers to be guarded against. If English commerce and manufactures were to hold their own they must all pull together—employers and employed alike.

Though they must not attribute too much significance to small variations, it was to be regretted that during the past year our exports and imports had fallen slightly. No doubt the diminution was only £7,000,000, and, as the total was £870,000,000, the reduction was really almost infinitesimal. It was, moreover, entirely due to a reduction in the export of coal and coke; or, as there had of course been other changes, perhaps he should rather say that the reduction in coal and coke was £8,250,000, and that if it had not been for this there would really have been an increase on the year. The figures were the more remarkable if they bore in mind the great falling-off in prices. For some purposes the weight of goods would be a better criterion than the value. Mr. John Williamson, of Liverpool, had calculated out for the Chamber of Shipping the total weight of our exports and imports as having been for 1880 53,000,000 tons, for 1890 76,500,000 tons, for 1900 102,500,000 tons, so that they had practically doubled in 20 years.

Taking another test—the total tonnage, steam and sailing, entered and cleared with cargoes or ballast at ports in the United Kingdom—Sir John Glover, in a paper read before the Statistical Society, had shown that the tonnage had risen from 39,634,000 in 1850 to 208,777,000 in 1900. These figures were exclusive of the tonnage for British vessels employed by Government in connection with the South African war. Not only were the figures for 1900 enormous and the greatest on record, but they showed the largest increase of any of the past five decades with one exception.

Referring to the question of the bounties, subsidies, and other advantages given to French shipping, he pointed out that, if our shipowners received no bounties, they, at any rate, were not burdened by contributions to bolster up other trades. The French wine-growers were now agitating for bounties, urging, not unnaturally, that if they were taxed to support other trades they should themselves receive corresponding treatment. But if all trades were equally protected none would benefit. They would pay with one hand what they received with the other; or, rather, they would pay more and receive less, because they would have to support an army of officials and Custom-houses, with all the expense and loss of time of declaring values, official examinations, and all the tedious routine which was such an impediment to commerce. If, moreover, one trade were unduly favoured, industry might be diverted into directions where full benefit could not be taken of the special advantages of the country. The United States seemed disposed to embark on the same course as France. Very powerful interests and a strongly-organised lobby were behind the Bill now before Congress. It was computed that this Bill, if it became law, would involve a yearly payment of at least \$9,000,000 to American ships of various classes. Nine million dollars was a large sum, but not enough, he believed, to effect so great a revolution in commerce as was projected. Last year he hinted a doubt whether the state of German trade was altogether healthy, and subsequent events had fully justified his apprehensions. Those events had shown the effect of relying on special Government grants, and he would venture to suggest that the best thing a Government could do for commerce was to let it alone. So far as we were concerned, the efforts of foreign Governments to push some of their trades hampered and handicapped the rest. Our sheet-anchor was the favoured-nation clause. He trusted our Government would hold fast by the policy of the open door, and, in the case of North China, for instance, would urge the United States, Japan, and other countries to join us in insisting that the commerce of the world shall have fair play.

The following resolutions were carried:—

(a) "That His Majesty's Government be urged, in the interests of commerce, that before recognising the transference of territory by any Power, they should insist on the adoption of the policy of the 'open door,' and should invite the co-operation of other States who are similarly interested with this country in maintaining existing rights."

(b) "That this Chamber is of opinion that the Mandalay-Kunlon railway should be extended without delay to the frontiers of China, and that the project for the construction of a line or lines in connection therewith to Yun-nan and Sze-chuan should receive the diplomatic and financial support of His

Majesty's Government and the Government of India; or if any other way of approach by rail to the Chinese provinces named be preferred by the British and Indian Governments, this Association would ask that a similar measure of support should be given to the contractors of any suitable railway by such route."

(c) "That this meeting strongly supports the resolution carried at the Fourth Congress of Chambers of Commerce of the Empire, stating 'that this Congress urges upon His Majesty's Government the appointment by them of a Royal Commission, composed of representatives of Great Britain and her colonies and India, to consider the possibilities of increasing and strengthening the trade relations between the different portions of the Empire,' and that a deputation be appointed by this Association to wait upon the Prime Minister, the Secretary of State for the Colonies, and the President of the Board of Trade to lay the question fully before them."

(d) "That this Association greatly regrets the comparative neglect of modern languages and science in our great public schools, and that a memorial be addressed to the Lord President of the Council urging him to take such steps as may be necessary to give effect in this respect to the wise regulations and statutes made by the Royal Commission on Public Schools, which was presided over by the late Archbishop of York, and of which the present Prime Minister was himself a member."

(e) "That the present state of the law as to punishment of fraudulent bankrupts is unsatisfactory, and that the executive council be requested to consult the various Chambers in the Association with a view to a Bill being introduced into Parliament to amend the existing law."

(f) "That this Association urges upon His Majesty's Government the desirability of introducing a Bill to secure the franchise in municipal and other local elections for corporations, limited liability, and other public companies; and that the voting power be limited to one vote per corporation or company."

(g) "That the Board of Trade should be requested to grant facilities for a full enquiry into the unsatisfactory working of the present law in regard to trade marks, and to receive a deputation thereon."

(h) "That, in the interests of British trade, the compulsory use of the metric system of weights and measures has become imperative."

(i) "That this Association records its appreciation, in the interests of commercial and other beneficial legislation, of the efforts now being made for the amendment of the present system of transacting both public and private business by Parliament and in Parliamentary committees, and, in addition, recommends the desirability of (1) Bills which have passed their second reading in one session being taken up in the next session of the same Parliament at the stage which they had reached in the preceding one; (2) enquiries into private Bills being conducted locally before Commissioners appointed by Parliament in a manner similar to that prescribed by the Act of 1899 with regard to Scotch Bills, instead of before committees of the Houses of Parliament."

(k) "That, in the opinion of this Association, the best means of providing an adequate supply of efficient and well-trained seamen for the services of the mercantile marine and Royal Naval Reserve was through the instrumentality of training ships and marine schools, and that memorials should be presented asking that such ships and schools should receive Government support."

Resolutions were also adopted advocating the raising of the fare limit for motor-wagons, the adoption of the Rating of Machinery Bill as a Government measure, the extension of trustees investment powers to eligible British securities at present disallowed, the provision of underground telegraph wires between London, Liverpool, and all other important commercial centres, the improvement of the cable communication with the Continent, the simplification of the half-penny postal regulations, and the reconstruction of the three lighthouse boards on a representative basis, to include representatives of shipowners, merchants, and shipmasters.

A cordial vote of thanks was passed to Lord Avebury for presiding, and the proceedings ended.

Liverpool.—Meetings of the committee of the African Trade Section of the Chamber have been held recently, presided over by Mr. John Holt, vice-chairman, in the absence of Sir Alfred Jones.

A copy of the ordinance, as contained in the *Government Gazette of Lagos*, No. 61, 1901, was submitted to the committee. The opinion was expressed that there should be no restrictions on the disposal by a native of his labour in the best market available, except such as would tend to safeguard his interests when employed. The committee had already expressed such an opinion in the case of the Sierra Leone native labour ordinance, and a letter was accordingly sent to Mr. Chamberlain reiterating the views of the committee, and asking him to receive a deputation on the subject. Mr. Chamberlain was also asked to give further information on the subject of the ordinance. He replied that the Governor of Lagos had telegraphed that a native labour ordinance had been passed, but that the text of the ordinance had not yet been received. Under this ordinance, labourers before leaving the colony will have to obtain the sanction of their chiefs, and must be engaged before a magistrate; half wages to the end of their agreements must be paid in Lagos, and employers are required to pay a capitation tax of £1 a head. In a subsequent letter Mr. Chamberlain wrote suggesting that the question of his receiving a deputation on the subject should not be dealt with until the text of the ordinance had been received.

Representations were made to the Colonial Office as to the advisability of continuing the telegraph line in Sierra Leone, running from Freetown to Mano, on to Sherbro, as there is no telegraphic communication between Sherbro and Freetown. The Colonial Office replied that they are consulting the Governor on the subject.

A sub-committee, consisting of Messrs. Holt, Moore, Cotterell, Paterson, and Lawrence Jones, have been appointed to consider the forestry proclamation of Southern Nigeria, and the rules, orders, etc., connected therewith. The sub-committee have met, and a report has been prepared on the subject, to be submitted to the full committee.

A letter was read from the Governor of Lagos, thanking the Chamber for bringing to his notice the scheme of Colonel Lamprey for ambulance trains, and saying that, after fully examining it, he does not consider anything of the kind is required in Lagos.

Cork.—According to the *French Journal Officiel*, the production of cork in the world, estimated at 1,000 metric tons (metric ton=2,204 lb. avoirdupois), is confined to Portugal, Spain, France, Italy, and North Africa (Tunis, Algeria, and Morocco). The area of French forests, including those in North Africa, really producing cork is more than one-half of the total extent of cork forests. These forests are composed mainly of cork trees, intermixed with pines and evergreen oaks. The demand for cork increases from day to day; and it is added that France, the United Kingdom, Germany, Russia, and the United States absorb 85 per cent. of the total consumption of cork.

GENERAL INTELLIGENCE OF THE PAST MONTH.

March, 1902.

UNITED KINGDOM.

MARCH 1st: St. David's Day was celebrated. Mr. J. Bryce presided at a dinner of the Eighty and Russell Clubs.

2nd: Death of Mr. John F. Bentley, architect.

3rd: The Prince and Princess of Wales left London for Bristol. In the House of Lords the Bill for the Prevention of Cruelty to Wild Animals was withdrawn. The House of Commons passed the second reading of the London Water Bill. Death of Lady Fazalgette.

4th: In the House of Commons Mr. Brodriek announced important changes in Army administration. Dr. J. McKean (N.) was returned unopposed M.P. for Monaghan, S. The Associated Chambers of Commerce opened their annual conference at the Hotel Métropole. The Queen Victoria Memorial Fund amounted to £190,000. The Duke of Bedford was appointed a K.G., and the Marquis of Waterford a K.P. The London Hackney Show was opened at Islington. Death of Mr. Bryan Donkin.

5th: The British Empire Trade League held a conference at Westminster. The Prince and Princess of Wales visited Avonmouth, when the first turf of the Royal Edward Dock was cut. The Birmingham Spring Shorthorn Show was opened. Sir H. Campbell-Bannerman was entertained at dinner by the National Liberal Club. Small-pox continued to spread in London.

6th: The King held a levée at St. James's Palace. Deaths—Lord Malcolm of Portlough, Sir T. Lucas, and Mr. W. Johnston of Liverpool. The Duke of Argyll presided at a meeting of the Women's Liberal Association.

7th: The King and Queen, accompanied by Princess Victoria, visited Dartmouth, where the King laid the foundation-stone of the new Naval College. The Prince of Wales presided at the annual general court of the King Edward's Hospital Fund. Princess Christian opened the annual exhibition of the Royal Amateur Art Society.

8th: The Queen launched the battleship *Queen*, and the King laid the first plate of the battleship *King Edward VII.* at Devonport. Death of Dr. Lumsden Probert. Death of Admiral C. L. Hockin. 73 cases of small-pox were reported in London.

10th: The King and Queen returned to London from the West. Lord Rosebery addressed a large public meeting at Glasgow. The Lord Mayor opened the exhibition of Colonial Products at the Royal Exchange.

11th: Lord Rosebery addressed the students of Glasgow University. The Central Poor-Law Conference was opened in the Guildhall.

12th: The King held an investiture at St. James's Palace. The Prince and Princess of Wales visited Manchester. In the House of Commons the Coal Mines (Employment) Bill was defeated. Mr. John Morley addressed a Liberal meeting in Manchester. The annual meeting of the Royal National Lifeboat Institution was held; the Prince of Wales was elected President.

13th: The Prince and Princess of Wales returned to London. The Princess Louise, Duchess of Argyll, visited Liverpool, and opened the new Northern Hospital. In the House of Lords the London Water Bill passed the second reading.

14th: The first Court of the new reign was held at Buckingham Palace. Lord Rosebery presided at the annual meeting of the City Liberal Club. Death of the Rev. Dr. Gee, Canon of Windsor. The Polo Pony Show was opened at the Agricultural Hall. It was announced that the proposed visit of the King to Ireland had been abandoned for the present. In the House of Commons the London County Council General Powers and Electric Supply Bills were read a second time. Death of Sir Gen. Sir W. G. Hunter.

15th: Lord Wolseley left Southampton for Cape Town. Death of Sir Richard Temple.

16th: The Bishop of London preached a farewell sermon to the boys of Christ's Hospital.

17th: The Prince and Princess of Wales opened the annual exhibition of the Irish Industries Association. St. Patrick's Day was celebrated. The Charity Organization Society held its annual meeting.

18th: The King decided to give a dinner to the poor in London in celebration of the Coronation. In the House of Commons a vote of censure on the Government was rejected.

19th: The Prince of Wales opened the National Physical Laboratory at Bushey-park. The Institution of Naval Architects opened their spring meeting. In the House of Commons the Aged Pensioners' Bill was read a second time. An International Cookery Exhibition was opened at the Albert Hall.

20th: The Prince and Princess of Wales visited the London Hospital. In the House of Commons the Consolidated Fund (No. 1) Bill was read a third time.

21st: Lord James of Hereford presided at the annual meeting of the Liberal Union Club. Captain Nott Bower was elected Commissioner of the City of London Police in the room of Sir H. Smith, resigned. A Royal Commission was appointed, with Lord James of Hereford as Chairman, to enquire into and report on the unrestricted immigration of aliens.

22nd: The Prince and Princess of Wales visited the Children's Hospital, Gt. Ormond Street. Cambridge won the University Boat Race. The Rev. C. Smith was appointed a Canon of Windsor in the room of the late Canon Gee. An Industrial Conference was held at Bradford by the Labour Association. 29th: The School Attendance Officers' National Association opened their annual conference. Death of Sir Sidney Shippard, formerly Resident Commissioner in Bechuanaland.

31st: The National Union of Teachers opened their annual conference at Bristol. The tenth annual conference of the Independent Labour Party was opened at Liverpool.

COLONIES.

Australia.—7th: The Federal House of Representatives continued to reduce the proposed tariff duties.—13th: The discussion of the Tariff Bill was concluded: it was decided that imports by the States Governments should be dutiable.—18th:

Mr. Deakins introduced a Bill in the Federal House providing for the establishment of a Federal High Court.—20th: The Federal Senate rejected the clauses of the Electoral Bill providing for proportional voting.—24th: Strong protests were raised in all the States against the abolition of the tea duty. **New South Wales.**—3rd: Death of Mr. Yardley, C.M.G., Secretary to the Agent General in London.—13th: The Chamber of Commerce of Sydney interviewed Mr. Barton with regard to the trade relations of the Commonwealth with the New Hebrides.—**Victoria.**—20th: It was proposed to reduce the pay of Members of the State Parliament.—31st: Death of Lieut.-General the Hon. Sir Andrew Clarke, Agent General in London.—**South Australia.**—31st: The Ministry was re-constituted, with Mr. Jenkins as Premier and Chief Secretary.—**Western Australia.**—7th: Major-General Sir H. Chermiside arrived at Fremantle.

New Zealand.—7th: Sir J. Prendergast was appointed a Director of the Bank of New Zealand, in the place of Mr. Blair, resigned.—9th: The Premier, Mr. Seddon, urged that the Australian Squadron should be strengthened.—15th: A sixth contingent of 1,000 men, making in all 6,000, was despatched for service in South Africa.—25th: The first section of the Pacific cable connecting New Zealand with Norfolk Island and Australia was completed at Doubtless Bay.

British West Africa.—6th: It was reported that the movements of the British columns against the Aros had been entirely successful.—14th: It was stated that the Aros intended to recommence fighting in November next.

Canada.—11th: It was announced that Sir Wilfrid Laurier would leave Canada for England about June 10.—17th: Mr. Fielding, the Financial Minister, presented his budget, showing a surplus of \$5,800,000.—22nd: The Dominion Cabinet decided to send a military contingent to the Coronation.—25th: The Government offered to send another contingent of 2,000 men for service in South Africa.

Cape Colony.—4th: The Parliament was prorogued till April 4.—8th: Mr. Rhodes was reported to be seriously ill.—20th: It was reported that Mr. Rhodes was recovering from his illness.—26th: Mr. Cecil Rhodes died at his residence near Cape Town in his 49th year.—27th: Princess Radziwill was committed for trial for forgery. The Boer "Government" reached Kroonstad and endeavoured to meet Mr. Steyn.

Ceylon.—17th: It was decided to found an eye hospital and an asylum for the blind as a memorial to the late Queen Victoria.

Jamaica.—2nd: Sir A. Jones arrived at Kingston.

Malta.—12th: The Members of the Legislative Council who resigned, were all re-elected unopposed: they declared themselves open to conciliation.—21st: The newly-elected members declined to consider the estimates until they received a reply from the Government respecting its policy on the language question.—26th: The Chief Secretary announced that teaching in Maltese in elementary schools would be limited to a period of one year. The estimates were passed with the exception of the education vote.

Natal.—1st: The Land Commission reported in favour of a general land tax.—8th: The Legislative Assembly adopted a motion making military service compulsory.

Newfoundland.—3rd: The population of Newfoundland and Labrador was stated to be 220,249.—12th: The *modus vivendi* Bill was passed and received the Governor's assent.

Orange River Colony.—1st: Major-General Sir C. Knox was appointed to command the Bloemfontein garrison.—14th: The Boers were driven between Frankfort and Lindley, but the main body escaped under Commandant Mentz.

Transvaal.—1st: The total Boer losses in recent operations was reported to be 819.—7th: It was stated that 1,295 stamps were at work on the Rand.—8th: Lord Kitchener reported the capture of a large quantity of Boer ammunition and stores.—8th: Lord Methuen's column, while moving to Lichtenburg, was surrounded and routed by the Boers under De la Rey. Lord Methuen was wounded and captured.—13th: Lord Kitchener reported that Lord Methuen had been released and brought to Klerksdrop.—23rd: The Boer "Government" arrived at Pretoria, under a flag of truce.—24th: Lord Kitchener reported further captures of Boers and war munitions, including three Krupp guns.

INDIA.

1st: The total number of persons in receipt of famine relief was reported to be 359,000.—8th: The number on famine relief was 369,000.—11th: The Mahsud blockade was withdrawn.—24th: The number of persons on famine relief was 392,000.—25th: Death of the Rt. Rev. F. Gell, Bishop of Madras from 1861 to 1898.—31st: Lord Curzon visited the Nizami of Haidarabad.

FOREIGN COUNTRIES.

Afghanistan.—8th: It was reported that the Ameer, anticipating trouble, had requested the Hadda Mullah to defer his visit to Cabul.

Arabia.—2nd: Fighting between the tribes was reported to have taken place in Central Arabia.—8th: Cholera broke out at Medina and Mecca.—26th: The cholera epidemic continued at Mecca, Medina, and Jiddah.

Belgium.—5th: The International Convention for the abolition of sugar bounties was signed at Brussels.

Bulgaria.—3rd: The elections resulted in the return of 97 Ministerialists and 92 members of other parties.—23rd: The Cabinet was reconstructed with M. Dimeff as Premier and Minister for Foreign Affairs, and M. Sarafoff as Finance Minister.

China.—1st: The rebellion in the Nanning district became serious.—4th: China urged the Foreign Powers to withdraw the provisional Government from Tien-tsin. 10th: Russia agreed to withdraw from Manchuria within 18 months of the signing of the proposed convention.—18th: The rebellion spread through the three provinces of Kwang-si, Kwang-tung and Yun-nan; General Ma was forced to retreat.—20th: Marshal Su's troops joined the rebels.—22nd: It was reported that a Belgian syndicate was negotiating for a concession of the Shanghai-Suchau-Nanking railway. The Kwangsi rebels captured the town of Kau-chau in Kwang-tung.

Corea.—16th: Work was begun on the Seoul-Wi-ju railway.

Cuba.—25th: It was stated that the island would be handed over to the Cuban Government on May 20, when Señor Palma will take office as President.

Denmark.—14th: The Folkething approved of the sale of the Danish West Indies to the United States.—27th: Queen Alexandra arrived at Copenhagen.

France.—3rd: M. Waldeck Rousseau continued to recover from the effects of his carriage accident.—5th: The National Miners' Congress decided that the eight hours' day should be obtained by a general strike. Prince Urusoff, the Russian Ambassador, presented an autograph letter from the Tsar to President Loubet inviting him to visit Russia.—7th: The Senate adopted the new Shipping Bounties Bill. The Chamber shelved an interpellation on the Anglo-Japanese agreement.—18th: The Chamber resolved that the next and future Chambers should last six years instead of four.—24th: A Bill was adopted by the

Chamber for a credit of 500,000 fr. to defray the expense of the Presidential journey to Russia. The Senate Committee opposed the prolongation of the legislative term from four to six years; M. Waldeck-Rousseau agreed to its abandonment.—27th: M. Delcassé urged the Chamber to press for a reduction of the import duties on wines in Russia and other countries.—28th: The Chamber adopted the Bill modifying the electoral constituencies, omitting the clause extending the term to six years.

Germany.—5th: The Budget Committee decided to reject the Government demand for 1,550,000 marks for the extension of the German East African railway to Mombasa.—28th: Death of Prince Münster, formerly German Ambassador in London. 31st: Death of Dr. Liëber, the leader of the Centre Party in the Reichstag.

Italy.—3rd: The Pope's Pontifical Jubilee was inaugurated in St. Peter's.—7th: Death of Captain Casati.—8th: The Pope received the Special British Mission sent to congratulate him on his Jubilee. The proposed railway strike was averted by the Government.—10th: The Chamber re-assembled and Signor Brancheré was elected President.—23rd: Count von Bülow arrived at Venice to meet the Premier and Foreign Minister.—27th: Signor Prinetti interviewed Count von Bülow at Venice.

Japan.—10th: The Diet was closed.—12th: The foreign community at Kobe declined to pay house-tax.—17th: The Government decided to refer the house-tax question to arbitration.—21st: Baron Kodama resigned the portfolio of War, and was succeeded by Viscount Terauchi.—24th: The financial conditions in Japan were reported to be improving.

Persia.—20th: It was reported that an agreement had been made with Russia for a loan of 10,000,000 roubles, Russia to have a concession for a new road from Tabriz to Teheran.—28th: It was announced that the Shah would make a European tour, arriving at Craeow on May 12.

Russia.—11th: The University of St. Petersburg was re-opened to students.—13th: Lieut.-Col. Grimm, of the General Staff, was arrested for betraying military secrets to foreign powers.—16th: A revolutionary demonstration took place in the Nevski Prospect, the main street of St. Petersburg, but was suppressed.

Servia.—5th: A revolutionary attempt was made at Shabatz by an agitator, Alavanties, who was shot.—6th: The 20th anniversary of the proclamation of the Servian Kingdom was celebrated.—19th: The Ministry resigned.

Spain.—1st: Señor Pidal, the Spanish Ambassador to the Vatican, resigned and was succeeded by Señor Agüera.—11th: The sittings of the Cortes were suspended. Señor Urzaiz, Minister of Finance, tendered his resignation.—13th: Señor Sagasta's Ministry resigned.—14th: Arbitration treaties were concluded with Central and South American countries.—18th: Señor Sagasta formed a new Cabinet with the Duke of Almodovar as Minister of Foreign Affairs and General Weyler as Minister of War.—26th: A new session of Parliament was convoked for April 3.

Sweden.—12th: The Government introduced a Bill for the extension of Parliamentary suffrage.—21st: Sir W. A. C. Barrington was appointed British Minister at Stockholm.

Turkey.—3rd: Ibrahim Pasha was shot by Albanians for endeavouring to restrain their violence. General Shakir Pasha was arrested.—6th: The Embassies presented a collective note protesting against the systematic hindrances offered to Cretans in their dealings with Turks.—8th: Shakir Pasha was released.—11th: An agreement was made with the British Ambassador for the repurchase of the Haifa-Damascus railway.—13th: The town of Kiangri in Asia Minor was destroyed by an earthquake.—17th: Fuad Pasha was exiled; many arrests were made.—26th: Hassan Fehmi Pasha was appointed Vali of Salonika in succession to Tewfik Bey.

United States.—3rd: Prince Henry of Prussia arrived at St. Louis on his tour through the Western States.—4th: Prince Henry arrived at Chicago. The Senate Canal Committee recommended that the Panama Company's offer should not be accepted.—5th: The Boer delegates were received as private citizens by President Roosevelt and Mr. Hay. Prince Henry arrived at Niagara Falls and visited the Canadian side. 6th: Prince Henry received the honorary degree of LL.D. at Harvard. 8th: Prince Henry was entertained at dinner by President Roosevelt.—10th: Mr. Long, Secretary to the Navy, tendered his resignation as from May 1; he will be succeeded by Mr. W. H. Moody.—11th: Prince Henry left New York for Germany.—12th: The Hepburn Bill, providing for the construction of a canal by the Nicaraguan route, was passed by the House of Representatives.—27th: The House of Representatives appointed a committee to investigate charges of bribery in connection with the purchase of the Danish West Indies. The President sent a message to Congress asking it to create a mission to Cuba.

Venezuela.—1st: A fresh invasion from Colombia under Dr. Rangel Gardias was reported as having been repulsed near Lafries with great loss.

FORTHCOMING EVENTS.

UNITED KINGDOM.

London.—His Majesty's birthday will be celebrated this year on Friday, May 30, on which day the usual official dinners will be given.—A proclamation, issued in the *London Gazette*, appoints June 26 and 27 next as Bank holidays and public holidays. The Coronation Naval Review at Portsmouth will take place on the 28th June.—The Austro-Hungarian Chamber of Commerce and Industry in London announces that an exhibition of Austrian fine art and decorative furniture will be held at Prince's Skating Rink, Kensington, from May 15 to July 31 inclusive. The exhibition is being promoted by the Austrian Ministry of Commerce, and the Emperor of Austria is taking a keen interest in the enterprise, which will embrace within its scope everything that is new, original, or characteristic in Austrian decorative art. The chief feature of the exhibition will be a large number of *intérieurs* by the leading furniture firms of Vienna. It is hoped that the opening ceremony will be performed by the Austrian Minister of Commerce.—On the 9th inst. at the monthly dinner of the London Chamber of Commerce, the subject for discussion will be "WEST AFRICA"; Sir George Taubman-Goldie will preside.—On the 15th, at the Royal Colonial Institute, a lecture will be given by Sir Hubert Jerningham on COLONIAL ADMINISTRATION.—On the 23rd, at the monthly dinner of the London Chamber of Commerce, the subject for discussion will be "THE COAL TRADE."

Wolverhampton.—His Royal Highness the Duke of Connaught will open the ART AND INDUSTRIAL EXHIBITION at Wolverhampton on May 1st.

FOREIGN COUNTRIES.

Chili.—An INTERNATIONAL EXHIBITION of SCHOOL REQUISITES (furniture, apparatus and scientific instruments, books, etc.) will be held at Santiago in September next on the occasion of the General Congress of Public Learning which is to be held there.

Corea.—JAPANESE COMMERCIAL MUSEUM.—It is reported that the Fusan Chamber of Commerce has decided to establish

a commercial museum in Fusan, and that the Yokohama Chamber of Commerce has been requested to send exhibits.

Japan (Osaka).—The special building to be provided for foreign exhibits at the NATIONAL INDUSTRIAL EXHIBITION, to be held at Osaka in 1903, will have an area of five-sixths of an acre.

Russia—Poland (Vilna).—An AGRICULTURAL AND INDUSTRIAL EXHIBITION will be held this year at Vilna, between the 13th and 21st of September. The Exhibition will consist of thirteen departments, namely:—1. Agriculture. 2. Cattle, sheep, pigs, etc. 3. Dairy farming. 4. Horses. 5. Agricultural machinery and implements. 6. Horticulture. 7. Bee-keeping, silk growing. 8. Pisciculture and fishing. 9. Forestry and timber industry. 10. Farm building. 11. Agricultural and factory industries. 12. Hand manufactures and mining industries. 13. General science.

NAVAL AND MILITARY INTELLIGENCE.

NAVAL.

The Government have placed with private firms contracts for two new battleships, five first-class cruisers, and two third-class cruisers.

The *Iphigenia*, cruiser, Captain S. V. Y. de Horsey, which has been employed in the carrying of relief crews, was paid off on the 10th ult. at Portsmouth.

The *Wolf*, torpedo-boat-destroyer, left Devonport on the 13th ult. for Portsmouth to be placed at the disposal of the Committee on Torpedo-Boat-Destroyers.

The battleship *Barfleur*, at Devonport dockyard, is forthwith to be refitted for further service at a cost of £80,000. The work will probably occupy twelve months.

The torpedo-boat-destroyers *Charger*, *Dasher*, and *Vixen* were commissioned at Devonport on the 11th ult. to replace the *Leopard*, *Gipsy*, and *Leven* in the instructional flotilla.

The *Sulley*, cruiser, which is to be commissioned at Chatham on April 6 to take the place of the *Diadem* in the Channel Squadron, will have a complement of 755 officers and men.

On April 2 the torpedo-boat-destroyers *Fawn*, at Portsmouth, and *Mallard*, at Chatham, will be commissioned for service in the Mediterranean, where they will relieve the *Hardy* and *Conflict*. The *Mallard* has recently been stiffened.

The cruiser *Philomel*, recently returned from the Cape of Good Hope, and paid off on the 18th ult. at Devonport, will be prepared at Haulbowline for another commission at a cost of £20,000. The Admiralty have approved of several important alterations being made in her equipment.

The *Bulwark*, battleship, was commissioned at Devonport on the 18th ult. by Captain F. T. Hamilton. Admiral Sir C. E. Donville, when he assumes command of the Mediterranean Squadron, will hoist his flag at Devonport in the *Bulwark*, which will relieve the *Renown*, battleship, flagship of Admiral Sir John Fisher.

The *King Edward VII.*, and the sister ships *Dominion* and *Commonwealth*, will be the largest battleships yet built for any navy. They will displace 16,500 tons, and will introduce a disposition of armament and protection altogether new to the British fleet. The ships will have great coal capacity. Their complement will be nearly 1,000 men if used as flagships.

The Admiralty have informed the dockyards that, owing to the Coronation review, there will be no mobilisation of the fleet this year for the ordinary annual naval manoeuvres. In place of these will be the important manoeuvres to be carried out by the Mediterranean Fleet and the Channel and Cruiser Squadrons, supplemented by a large number of ships to be sent from England after the Naval Review.

The new battleship *Vengeance* will be commissioned on April 8 for service on the Mediterranean Station. The other five vessels of her class—i.e., the *Albion*, *Glory*, *Goliath*, and *Ocean*—are already in commission on the China Station, and the *Canopus* is serving in the Mediterranean. The station originally named for the *Vengeance* was China, but it is possible, now that the Anglo-Japanese understanding has been arrived at, we shall not further reinforce our fleet in Far Eastern waters. The first-class armoured cruiser *Aboukir* is also to go to the Mediterranean, and she is to commission on April 3 to relieve the *Theseus*, which has been in commission since January, 1899. The latter vessel, although a very fine and efficient cruiser, is neither as fast nor as powerful as the *Aboukir*.

The first-class armoured cruiser *Leviathan*, which has been built by contract at Clydebank, is nearly ready for delivery, and a navigating party was despatched to the Clyde on the 19th ult. for the purpose of conveying the vessel to Portsmouth Dockyard, where she will be completed for sea. The *Leviathan*, which is of 14,100 tons displacement, 30,000 horse-power, and an estimated full speed of 23 knots per hour, was laid down at Clydebank on the 30th November, 1899, and launched on the 3rd June, 1901. She will be the third of the four gigantic cruisers that were allowed for in the estimates of 1898-9, to be delivered—the *Good Hope* and *Drake* being already at Portsmouth. The *King Alfred*, which was launched at Barrow on the 28th October of last year, will complete this class of valuable vessels.

The *Prometheus*, a small third-class steel cruiser of 2,135 tons displacement, has lately been carrying out some very interesting steam trials, designed to determine the efficiency of her propellers under various conditions of working. In a recent experiment which has just been concluded at Portsmouth, it was found that with the latest adjustment of the pitch of her propellers she succeeded in obtaining the speed of 20.3 knots per hour, which is slightly in excess of her estimated full speed of 20 knots, and that she was able to obtain this very satisfactory result with the engines developing about 1,000 horse-power less than had been the case on previous occasions with other adjustments. As there are no less than eleven vessels of the *Prometheus* class in the navy, the successful alterations which have been made in this ship have a very important bearing upon the others of her class.

The battleship *Queen*, which was launched by Her Majesty at Devonport on the 8th ult., and the *King Edward VII.*, of which the King laid the keel-plate, in the dockyard there, represent very powerful types in the navy. The *Queen* displaces 15,000 tons, and is 400 ft. long, with 75 ft. beam and 26 ft. 9 in. draught. In her general characteristics she resembles the *Venerable*, *London*, and *Bulwark*, which are, practically, the same as the ships of the *Formidable* class, but with side armour extending much nearer to the bow. In the *Queen* the armour includes a Krupp steel belt, commencing some 30 ft. from the bow and running a distance of 220 ft. towards the after-part of the ship. It is 15 feet deep, and the armour-plates are 9 in. thick. There is a curved transverse bulkhead near the after barquette of 12 in. steel, and the barquettes themselves have plates varying from 6 in. to 12 in. A protective deck covers the vital parts, being 1 in. thick on the flat and 2 in. on the slopes, where it reinforces the side armour. In the matter of armament and speed, the *Queen*, like her sister ship, the *Prince of Wales*, which the Princess launched at Chatham on the 25th ult., marks a distinct advance on the *Venerable* class. The four 12-in. 50-ton wire-wound guns, with hoods of 8-in. and 10-in. armour, are the

same, but, instead of twelve 6-in. Vickers quick-firers, there are eight 7.5-in. modified quick-firers of a new and more powerful type, with ten of the 6-in. guns. There are also 18 12-prs. and a number of 3-pr. Hotchkiss and Maxim machine-guns. The ships of the *Venerable* class have a nominal speed of 18 knots, with 15,000 horse-power; but the *Queen*, with 20,000 horse-power, is to steam at 19 knots. She is to have Babcock and Wilcox boilers.

Chili.—The new battleships ordered by the Chilean Government to be built at Barrow and Newcastle-on-Tyne will be 435 ft. long, with 70 ft. beam, and will have a speed of 21 knots, with engines having 25,000 horse-power. Each ship will carry four 10-in. guns, 14 7.5 guns, and many smaller quick-firing guns. The vessels will cost slightly over £1,000,000 each, and are to be delivered within eighteen months.

France.—Rear-Admiral Eugène Albert Maréchal has been appointed to take command of the French naval division in the Far East, to succeed Admiral Edouard Pottier.

Russia.—The trials of the new Russian battleship *Pobieda*, which have recently taken place, have been fairly satisfactory, a mean speed of 18.5 knots having been registered on the measured mile. This vessel, which was laid down at the Baltic Works, at St. Petersburg, on February 18, 1899, and launched on May 24, 1900, is fitted with triple screws, driven by engines of an aggregate horse-power of 14,500; the maximum revolutions per minute of the engines are 115, but on the above trials they were run at from 104 to 110 revolutions per minute, and so the estimated speed of 19 knots per hour was not obtained. This speed, however, it is expected, will easily be procured when the vessel is put upon her full-power trials. The *Pobieda* is of 12,674 tons displacement, and is fitted with an installation of 30 boilers of the Belleville type. She is armed with four 10-in. and ten 6-in. guns, in addition to a smaller armament, and carries 724 officers and men. She is a sister vessel to the *Peresviet* and *Ossliabya*, which were also constructed at St. Petersburg.

MILITARY.

Major-General the Earl of Dundonald is to be offered the command of the Canadian Dominion Forces.

The recruiting returns for February show a marked improvement upon those issued for December and January.

Captain C. G. Pritchard, Royal Garrison Artillery, has been appointed Commandant of the Hong Kong Volunteers.

Major G. R. T. Rundle, R.F.A., has been appointed to command the 50th Brigade Division Royal Field Artillery at Woolwich.

The 2nd Battalion Cameron Highlanders which has been stationed at Gibraltar since 1899, has been ordered to embark for Crete at the end of the month.

Major the Hon. H. S. Davey, 18th Hussars, on promotion, has been appointed second in command of the 3rd Provisional Regiment of Hussars at Aldershot.

Lieut.-Colonel W. H. Williams, C.M.G., R.A., has, on promotion, been appointed to command the 28th Brigade Division Royal Field Artillery at Woolwich.

Lieutenant H. E. M. Douglas, V.C., D.S.O., Royal Army Medical Corps, who was wounded at Magersfontein, has been appointed for light duty in the Home District.

Major C. E. Mills, Prince of Wales's Own West Yorkshire Regiment, has been appointed to succeed Lieut.-Colonel G. Grant-Dalton in command of the 1st Battalion.

Major-General F. G. Slade, C.B., commanding the Royal Artillery at Gibraltar, has been appointed Inspector-General of Royal Garrison Artillery for a period of three years.

Captain the Hon. A. V. Meade, Royal Horse Guards, who has served on the staff in South Africa, has been selected for second-in-command of the 30th Battalion of Imperial Yeomanry.

General Sir George White arrived at Gibraltar on the 18th ult. from England, and resumed the supreme civil and military command.

Sir Hector MacDonald arrived on the 26th ult. at Colombo, to assume the command of the forces in Ceylon, in succession to Major-General Hobson.

Colonel Lord Hardinge 7th (Tower Hamlets Militia) Battalion of the Rifle Brigade, is to be appointed an Aide-de-Camp on the staff of Lord Roberts.

Lieut.-Colonel F. W. T. Attree, R.E., has been appointed Commanding Royal Engineer of the South Wales Sub-District, in place of Colonel H. H. Muirhead, who retires on April 4.

All available men of the details of the Hampshire Regiment, at Aldershot, are also to be in readiness to embark for South Africa about April 15. This draft will go out very strong.

The Commander-in-Chief has approved of Lieut.-Colonel the Hon. J. E. Lindley, now temporarily commandant of the Imperial Yeomanry School at Aldershot, being confirmed in that appointment to complete five years.

Major W. E. Fairholme, C.M.G., Royal Artillery, now on Sir General Sir George White's Staff at Gibraltar, is to be Military Attaché in Vienna, succeeding Colonel F. M. Wardrop, C.B.

The King has been pleased to approve of the appointment of Lieut.-Colonel E. J. Swayne, Indian Staff Corps, to be H.M. Commissioner and Consul-General in the Somali Coast Protectorate.

Lieutenant H. S. Moberly, Indian Staff Corps, serving with the Hong Kong Regiment, has been appointed Aide-de-Camp to Major-General Sir A. R. F. Dorward, commanding at Shanghai.

Major-General Frederick George Slade, C.B., who has been commanding the Royal Artillery at Gibraltar since March, 1899, returns to England to take over the post of Inspector-General of Garrison Artillery at the War Office from the 1st inst.

A cheque for £500 "to help in meeting the expenses connected with the erection of the new Soldiers' Home in Buckingham-palace-road," has been forwarded to Sir George Chubb from an old Guardsman through the Brigade Major, Brigade of Guards.

Colonel Sir Charles Parsons, K.C.M.G., Assistant Adjutant-General in the Woolwich District, has been appointed a Colonel on the Staff, to command the Regular troops in the Dominion of Canada, with the local rank of Major-General. The appointment has been reduced from a Lieut.-General's post.

Orders have been issued for drafts of the Derbyshire, Royal Irish, and Cheshire Regiments, and South Wales Borderers, at Aldershot, to be prepared by the officer commanding the 2nd Provisional Battalion to embark in the middle of April for South Africa.

Colonel Sir James Willcocks, D.S.O., recently arrived from South Africa, left England on the 13th ult. to assume the command of the Belgum second-class district, to which he has been appointed in succession to Sir Hector MacDonald, D.S.O., who has been appointed to the command of the troops in Ceylon.

Colonel J. M. Hunt, 2nd Battalion Cameron Highlanders, temporarily commanding the Infantry Brigade at Gibraltar, is to be appointed to the command of the 91st (Argyll and Sutherland Highlanders) Regimental District; and Colonel E. J. Gallwey, C.B., 2nd Battalion Somersetshire Light Infantry, to the command of the 13th (Somersetshire) Regimental District.

STATISTICAL NOTES.

Foreign Trade and Commerce.—Accounts are published relating to the trade and commerce of certain British Possessions and foreign countries, from which the following figures are taken, showing the total imports and exports of the principal countries for which the particulars can be given up to December, 1901, inclusive, and referring in all cases to the same period, namely, the twelve months January—December. The corresponding figures for 1900 are added for comparison:—

12 months ended December.	Imports.		Exports.	
	1900.	1901.	1900.	1901.
Germany	288,281,000	283,827,000	230,569,000	283,850,000
Belgium*	85,871,000	88,226,000	74,266,000	73,092,000
France	187,912,000	188,582,000	164,348,000	166,647,000
Spain*	34,769,000	33,552,000	29,310,000	26,818,000
Italy	68,009,000	68,704,000	53,530,000	54,981,000
Austria-Hungary	70,682,000	70,933,000	80,917,000	78,716,000
Egypt	14,480,000	15,642,000	17,204,000	16,140,000
United States	172,740,000	183,421,000	302,710,000	299,601,000
Japan	29,057,000	25,902,000	19,651,000	25,288,000
British India	48,005,000	55,404,000	68,246,000	77,347,000
Canada	36,021,000	38,434,300	34,929,200	38,084,500
United Kingdom	523,075,000	522,239,000	291,192,000	280,499,000

*Value of principal articles only.

In the case of Germany, Belgium, France, Italy, Austria-Hungary, Japan, and Canada, the import figures given in the above summary represent imports for home consumption only. In all cases the export figures represent exports of domestic produce.

For the use of these tables the following explanation is necessary:—The figures in heavier type represent either of the columns beside it, as the case may be; viz., with hectares and acres in the first set of columns, 1 acre=0.405 hectare, and vice versa, 1 hectare=2.471 acres, and so on.

Consumption of Coal in France.—The Commission appointed to report upon the mineral production of France has terminated its labours, and, dealing with the production and consumption of coal in 1900, states that in that year the rise in the price was higher than it had been since 1873. The average price at the pit's mouth was nearly 12s. a ton, this being 2s. per ton higher than in the previous year. The report of the Commission attributes this rise to the general strike of miners in the South Wales coal mines and to the exceptional demand for coal, owing to the Transvaal war, and the requirements of the transport service. The consumption of coal in France for that year was 48,803,000 tons, or 3,575,000 tons more than in the preceding year. The production of the French coal mines is only 33,404,000 tons, and the imports for 1900 were 16,177,000 tons, or nearly half the total production. Just half of this came from England, while Belgium supplied 5,330,000 tons and Germany 1,615,000 tons, a small quantity coming—for the first time—from the United States. The total value of the output of coal at the pit's mouth is estimated at £20,000,000, or about £3,600,000 more than in the preceding year, and of this large sum £8,600,000 represents the wages paid to 162,100 men employed in the mines.

Telegraphic Address: "PACKLESS" MANCHESTER. A.B.C. CODE USED.

"KARMAL" PACKING NEEDS NO OIL OR TALLOW. LUBRICATING PROPERTIES. NEVER CEASE. NEVER CHARS OR BECOMES HARD. SUITS HOT & COLD WATER. WILL STAND ANY PRESSURE OF STEAM OR DEGREE OF HEAT. NEVER MELTS OR BURNS. THE BUYER HAS THE SATISFACTION OF USING ALL UP.

Products Exhibited.—Fodder grasses, foods and food stuffs, sugar, spices and condiments, models of fruits, narcotics (including opium, ganja, etc.), tobacco and cigars, tea and coffee, oils and oil-seeds (including those of castor, sesamum, linseed, cocoa-nut and ground nut, etc.), a large assortment of drugs, dyes and tans, gums and resins (including the resins and turpentine of Indian pines, wax, lac, etc.), an extensive collection of fibres (including cotton, silk, jute, coir, rhea, agave, etc.), models illustrating the manufacture of cotton and jute, minerals (including building stones, coal, mica, soapstone, corundum, iron ores, steel, etc.), timbers, collection of Indian pottery, carved woodwork, silver, brass and copper ware, silk and cotton fabrics.

CEYLON. (East Gallery.)

Representative Governor.—The Rt. Hon. the LORD STANMORE, G.C.M.G.

Executive Officer and Home Agent.—FREDK. H. M. CORBET, Esq., Barrister-at-Law.

Curator of Collection.—Mr. J. R. ROYLE, C.I.E.

Products Exhibited.—Cereals, pulses, edible fruits, roots and grains, spices and condiments, drugs, horns, skins, pearls, shells, wax, oils, gums, resins, dyes, tans, fibres, timbers, building stones, plumbago, metallic ores, rough gems, palm products, tea, coffee, cocoa, cinchona bark, sugar, tobacco, cotton-cloth, mats, rattan and basket work, wood and ivory carving, metal-work, pottery, tortoise-shell and porcupine quill work, lacquer work, lace, etc., etc.

STRAITS SETTLEMENTS (AND JOHOR).

(East Gallery.)

Representative Governor.—SIR CECIL CLEMENTI SMITH, G.C.M.G.

Corresponding Agents.—The COLONIAL SECRETARY (at Singapore); The Dato JAMES MELDRUM (for Johor). *Curator of Collections.*—(In charge of Institute Staff.)

Products Exhibited.—Barks, canes, drugs, fibres, preserved fruits (including Singapore pine-apples), mats, silk fabrics, oils and oil-seeds, dyes and tans, gums, gutta-percha, tin ores and other minerals, teas, coffee, spices, timbers, etc., etc.

MAURITIUS (AND SEYCHELLES).

(West Central Lower Gallery.)

Representative Governor.—[VACANT.]

Corresponding Agent in Colony.—Mr. A. DARUTY DE GRANDPRÉ, Museum Superintendent.

Corresponding Agent for Seychelles.—The Hon. E. B. SWEET-ESCOTT, C.M.G., Administrator.

Curator of Collection.—(In charge of Institute Staff.)

Products Exhibited.—Fibres, hemp, oils, rum, seeds, sugars, tortoise-shell, vanilla beans, with specimens of native workmanship, etc., etc.

HONG KONG. (Middle of Central Lower Gallery.)

Representative Governor.—SIR WILLIAM ROBINSON, G.C.M.G.

Corresponding Agent in Colony.—THE HARBOUR MASTER.

Curator of Collection.—(In charge of Institute Staff.)

Products Exhibited.—China, carved and inlaid ivory and wood-work, silver and lacquer ware, silk and cotton fabrics, drugs, paints, dyes, food stuffs, etc., etc.

BRITISH NORTH BORNEO. (West Central Lower Gallery.)

Corresponding Agent.—(At present through the British North Borneo Co.)

Curator of Collections.—(In charge of Institute Staff.)

Products Exhibited.—Timbers, rattans, coal, rice, sago, sugarcane and raw sugar, coffee, cocoa pods, pepper, tobacco, beeswax, camphor, gutta-percha, kapok fibre, dammars, cutch and gambier, hemp, honey, etc.

BRITISH POSSESSIONS (EUROPE).

MALTA, GIBRALTAR, AND CYPRUS.

(West Central Gallery.)

Representative Governor.—Gen. SIR ROBERT BIDDULPH, G.C.B., G.C.M.G.

Corresponding Agent.—(At present through the Representative Governor.)

Curator of Collections.—(In charge of Institute Staff.)

Products Exhibited.—From Malta—Carved stone-work, lace, macaroni, honey, various fabrics, models, pictures, etc., etc. Gibraltar and Cyprus—None at present.

IMPERIAL INSTITUTE JOURNAL.

VOL. VIII. No. 89.

LONDON.

MAY, 1902.

GENERAL NOTICES.

"THE IMPERIAL INSTITUTE JOURNAL."

Fellows resident in the United Kingdom, the Colonies, India, and Foreign Countries, are supplied with the JOURNAL free by post each month.

The Subscription to the JOURNAL from other than Fellows, both at home and abroad, is as follows, including Postage, and Posted Monthly:—

Yearly . 8s. 6d. | Half-yearly . 4s. 6d. | Quarterly . 2s. 6d.

Subscribers to the JOURNAL can have it forwarded by post on each day of publication by payment in advance. Post Office Orders or Cheques should be made payable to the Editor, at the Imperial Institute, South Kensington, S.W., to whom also all communications relating to the JOURNAL should be addressed.

The JOURNAL may also be purchased for Sixpence each copy at the Ticket Office of the Institute and at the railway book-stalls of Messrs. WILLING & Co.

The City Agents for the JOURNAL are Messrs. WILLING & Co., 17, Royal Exchange, London, E.C. It may also be obtained at the offices of the printers, WATERLOW & SONS LIMITED, Blomfield-house, London-wall, London, E.C.

Communications respecting Advertisements should be addressed to the ADVERTISEMENT MANAGER, 6, Arundel-street, Strand, London, W.C.

This JOURNAL is distributed (by post) throughout the United Kingdom, India, and the Colonies of the British Empire, and to the following Foreign Countries:—Argentine Republic, Austria-Hungary, Belgium, Bolivia, Chili, China, Colombia, Costa Rica, Denmark, Egypt, France, Germany, Greece, Hawaiian Islands, Holland, Italy, Japan, Mexico, Montenegro, Morocco, Norway, Persia, Peru, Portugal, Russia, Siam, Spain, Sweden, Switzerland, Tripoli, Turkey, United States of America, Uruguay, and Venezuela. The JOURNAL is also placed in the Reading Rooms of CHAMBERS OF COMMERCE, CLUBS, and HOTELS, both at home and abroad.

SPECIAL NOTICE.

EXHIBITION OF GIFTS AND ADDRESSES PRESENTED TO THE PRINCE AND PRINCESS OF WALES, DURING THEIR COLONIAL TOUR IN 1901.

His Royal Highness the PRESIDENT of the IMPERIAL INSTITUTE has decided that an EXHIBITION shall be held in the North Gallery of the Institute of the GIFTS and ADDRESSES presented to their Royal Highnesses the PRINCE AND PRINCESS OF WALES on the occasion of their visiting the Colonies in 1901. The Exhibition will be open to the Public (Admission 1s.) on the 15th inst., from 11 a.m. to 7 p.m., and until further notice. The PRINCE OF WALES has also decided that the proceeds of the Exhibition shall be added to the "CORONATION GIFT" to KING EDWARD'S HOSPITAL FUND.

SPECIAL EXHIBITION OF COLONIAL PRODUCTS AND INDUSTRIES.

A Special Exhibition of Collections illustrative of the Mineral Wealth and of certain Industries of the DOMINION OF CANADA, also of commercial products from QUEENSLAND and from RHODESIA, will be on view on and after the 15th inst., in the western half of the North Gallery, from 11 a.m. to 7 p.m., on week-days—Admission Free.

The whole of the Collections at the Institute will be open until 7 p.m. during the continuance of the Exhibition of Gifts and Addresses.

FELLOWS' DEPARTMENT.

The Reading, Writing, and News Rooms, are open for the use of Fellows every week-day from 10 a.m. till 11.30 p.m., and on Sundays from 3 p.m. to 10.30 p.m. The Library (on the First Floor), is open from 10 a.m. to dusk on Week-days, and from 3 p.m. to dusk on Sundays. The Map Room (First Floor) is open from 10 a.m. to 5 p.m. on Week-days.

The Poste Restante is open every week-day for receipt and delivery of letters and parcels. Letters addressed to initials only are not received, except in reply to notices in the JOURNAL, under "Requirements" Registry. The General Post Office Pillar Box is cleared daily twelve times, between 10.10 a.m. and midnight. Light refreshments only are, for the present, provided in the Fellows' Rooms and at the bar of the Ceylon Kiosk.

EMIGRATION INFORMATION OFFICE.

The Office of the British Women's Emigration Association (see page 134), in the West Corridor, First Floor, is open daily from 10 a.m. to 4 p.m., and advice and information respecting emigration and openings in the Colonies may be obtained there free of charge. Enquiries of all kinds relating to the Colonies from intending Emigrants are dealt with in the Commercial Intelligence Department, and special information respecting Canada and the Cape Colony may also be obtained from the Curators for these Colonies, on application personally at their offices, or by letter.

SCHOOL OF MODERN ORIENTAL STUDIES.

An "Ouseley" Scholarship of £50 per annum, tenable for two years, will be awarded, should sufficient merit be shown, for proficiency in PERSIAN. No person will be admitted to competition for a Scholarship in a language which is his own mother tongue, nor for a Scholarship in a language allied to his mother tongue. The examination will take place early in July next. Full particulars may be obtained of the Secretary to the School, Imperial Institute. (For further information see page 133.)

SCIENTIFIC AND TECHNICAL DEPARTMENT.

The Scientific and Technical Department of the Institute has been established to acquire information by special enquiries and by experimental research, technical trials and commercial valuation regarding new or little known natural or manufactured products of the various Colonies and Dependencies of the British Empire and of foreign countries, and also regarding known products procurable from new sources, and local products of manufacture which it is desired to export. This work is carried out with a view to the creation of new openings in trade, or the promotion of industrial developments.

In the extensive and well-equipped series of Research Laboratories occupying the West Corridor of the Second Floor, a staff of skilled Chemists, under the direction of Professor Wyndham R. Dunstan, M.A., F.R.S., carry out the investigation of the chemical constitution and properties of new dye-stuffs, tanning materials, seeds and food-stuffs, oils, gums and resins, fibres, timbers, medicinal plants and products; animal products, minerals and ores, soils, cements, and various other products, with a view to their commercial utilization. Whenever necessary these materials are submitted to special scientific experts, by whom they are made the subjects of particular investigation or practical tests. Reports are also obtained from technical or trade-experts in regard to the probable commercial or industrial value of any such products, whilst full information is collected from official or other trustworthy sources regarding the probable extent and cost of available supplies. All materials requiring scientific or technical examination, or commercial valuation, should be submitted to the Institute for examination either by, or through, the Foreign Office, the Colonial Office, the India Office, or the Board of Trade, or through the Colonial or Indian Government Authorities. Requests for the examination of such materials may also be submitted by Public Commercial Bodies and Institutions of the respective Colonies and Dependencies, or by the Representatives of H.M. Government in foreign countries.

COMMERCIAL INTELLIGENCE DEPARTMENT.

The Office of this Department, in the West Corridor, First Floor, is open daily from 10 a.m. to 5 p.m. (on Saturdays till 1 p.m.), for the purpose of answering enquiries and supplying information relating to the Commerce (Export and Import) and Industries of India and the Colonies. Applications may be made personally or by letter. Special information may be obtained from the Curators in charge of the Indian and of certain Colonial Collections. Arrangements have been made for the translation for mercantile firms of Trade Circulars, Price-Lists, and Catalogues into any Foreign Language, including the conversion of weights, measures and coinages, etc., at cost price, and application for such may be addressed to this Department.

COMMERCIAL COLLECTIONS.

The Galleries containing the Colonial and Indian Collections, and the Public Commercial and Industrial News Room, are open for free inspection by the public daily, except Sundays, and any days specially notified, from 11 a.m. until 5 p.m. (on and after the 15th inst. until 7 p.m.). Every information concerning the products, their supply, etc., can be obtained on application to the Curators of the Indian and Ceylon, Canadian, and South African Sections, to the general Curator, and to the Commercial Intelligence Department.

CITY BRANCH OF THE IMPERIAL INSTITUTE.

REMOVAL TO 49, EASTCHEAP, E.C.

On and after May 1st, the City Enquiry Office and Reading Room will be removed from 112, Cannon-street to larger premises at 49, EASTCHEAP, where a commodious apartment will also be opened early this month for the display, to merchants, manufacturers, etc., of raw and manufactured products received, from time to time, from the Colonies and from India, and for which it is desired to find openings in British markets. Curators and other members of the Imperial Institute staff will attend at the Office, at stated times and by special appointment, to deal with enquiries and to assist in establishing or facilitating business relations with mercantile houses, etc., in the Colonies and India. The City Branch is in constant communication, by telephone and messengers, with the Imperial Institute, South Kensington. (For further information see page 132.)

THE NORTHBROOK SOCIETY.

The Northbrook Society is affiliated to the Imperial Institute, and has a special room allotted for the exclusive use of its members in the Institute buildings. Its primary objects are to watch over and promote the interests of natives of India, and to provide a system of guardianship or supervision over such as are sent to Europe for education. The Society is controlled by a committee consisting of an equal number of Governors of the Imperial Institute and members of the Society, presided over by the Earl of Northbrook. It possesses an excellent library. Indian members, who pay no subscription to the Society, have the especial advantage of becoming Fellows of the Institute at half the usual subscription payable by the ordinary Fellows. Applications for membership of the Society should be addressed to the Secretary of the Northbrook Society, Imperial Institute, London, S.W.

"REQUIREMENTS" REGISTRY.

With the object of affording Fellows of the Imperial Institute, and the General Public resident in the United Kingdom, an opportunity of making known special "wants" or "needs" in the British Colonies, India, and Foreign Countries, space will be regularly devoted to approved notices in a column reserved for this purpose. Advertisers may have their replies addressed to them direct, c/o the Imperial Institute, London, S.W., under a distinctive number and initials. The cost of postage will be charged for the transmission of replies delivered at the Institute. Residents in the Colonies and India, and Foreign Countries, can register in like manner. (For further particulars see page 130.)

FINANCIAL AND COMMERCIAL RETROSPECT.

UNITED KINGDOM.—In making his Budget statement on the 14th of last month, the Chancellor of the Exchequer said that for the year 1901-1902 the total issues from the Exchequer were £195,522,000; the original expenditure provided for in the Budget of that year was £184,212,000, but that amount had been swollen by supplementary estimates of £12,631,000, and an unexpected increase in the Consolidated Fund charges of £73,000, though, on the other hand, savings had been effected to the extent of £1,394,000. The estimated revenue was £142,455,000, but the actual receipts were greater by £543,000. The sugar tax yielded £1,290,000 more than was expected, and the coal duty brought in rather more than the estimate, and that with scarcely any effect on the exports, which were higher than ever they had been except in 1900-1901. The duties on wine, beer and spirits produced less than was allowed for, but the receipts from tea and income-tax were better than expected. The deficit was £52,524,000. This had been met out of the Consols loan, which yielded £56,553,000, leaving a balance of over £4,000,000. For the current year the Chancellor put the expenditure at £174,609,000, the main items being:—Consolidated Fund charges £29,450,000; Army estimates £69,665,000; Navy estimates £31,255,000; Civil Service estimates £26,448,000; Customs and Inland Revenue £3,039,000; and Postal service £14,752,000. The receipts, estimated on the basis of existing taxation, were £147,785,000, made up of Customs, £32,800,000; Excise, £32,700,000; Death duties, £13,200,000; Stamps, £8,200,000; Land-tax and House duty, £2,500,000; Income-tax, £36,600,000; Post-office, £14,800,000; Telegraphs, £3,630,000; Crown lands, £475,000; Suez canal, £880,000; and Miscellaneous, £2,000,000. The estimated deficit thus amounted to £26,824,000, increased by further war expenditure and help to sugar-growing colonies to a total of £45,500,000. To meet this, the Chancellor proposed to take £3,500,000 from the existing Exchequer balances, to get £4,500,000 by suspending the Sinking Fund, to raise £32,000,000 by a new loan, and to create new taxation, estimated to produce £5,150,000. The new taxes proposed are a duty of 3d. per cwt. on imported corn and 5d. per cwt. on imported flour, estimated to yield £2,650,000; an increase of 1d. on the income-tax, estimated to yield £2,000,000; and an additional penny stamp on cheques and dividend warrants, which it is hoped will yield £500,000. The duty on corn has met with general approval from almost all, except those whose business it is to oppose, as a step in the desirable direction of broadening taxation; the increased income tax has been received with submissiveness as being only what was to be expected from the wisdom which at present is at the head of the nation's finance; and the stamp duty is the only one of the three that has aroused much feeling, largely on the ground that it is futile to worry people with an impost which will bring in only a paltry amount, even if it is successful, as is not regarded as by any means certain in some competent quarters.

At first sight the trade returns for March appear very bad as compared with those for the same month of last year, for in both the imports and the exports there is a falling off of over 11 per cent., the imports at £40,897,861 being £5,528,195 less than in last year, while the exports at £22,217,238 are £2,804,055 to the worse. It must be remembered, however, that Easter falling in March this year diminished the time available for business by at least two days, while on the export side the amount received for new ships sold abroad was £2,167,225 less than last year. In the imports the decrease was generally distributed over the whole range of articles, and only a few of the total number showed an increase either in quantity or value. Among raw materials for textile industries there were some exceptions. Owing to larger shipments from Brazil and the United States, the quantity of raw cotton increased by 17.1 per cent., though its value was only 4.8 per cent. better. The value of cotton manufactures increased by 13.1 per cent. Wool, on the other hand, was less by 40,997,902 lb. (45.7 per cent.), and in value lost £1,376,388, or 47.8 per cent., owing to smaller receipts from Australia and New Zealand. In hemp there was a fall of 13.9 per cent. in amount, with a very small rise in value, and in jute there was a rise in both respects, 36.4 per cent. in quantity and 17.4 per cent. in value. In articles of food there was a fall of 1,306,100 cwt. in wheat, together with an almost exactly equivalent diminution of value, owing to a great reduction in the supply from the United States and Argentina. Wheat flour, owing to smaller shipments from the United States, was less by 33.5 per cent. in quantity, its value being 34.4 per cent. less. Oats, too, fell off, the reduction in amount being 41.4 per cent., and in value 27.1 per cent. The value of Indian corn was 9 per cent. smaller, but the reduction in quantity amounted to 22.3 per cent.; the United States sent only 201,200 cwt., against 3,904,000 cwt. in March last year; but Roumania sent 1,364,200 cwt. against 12,500 cwt., and Russia 1,030,300 cwt. against 63,300 cwt. The only one of the cereals for which higher figures were reported was barley, the quantity of which rose 26.2 per cent., owing to larger shipments from Roumania and the United States; its value was 24.1 per cent. higher. In sugar there was a large falling off. The refined article was £481,769 (32.6 per cent.) less in value, the quantity having diminished from 2,405,461 cwt. to 1,868,328 cwt., while raw sugar fell from 2,744,526 cwt. to 1,345,766 cwt. (63.7 per cent.) in quantity, and was

£869,501 (50.9 per cent.) less in value. In the exports coal was shipped to a slightly greater extent (2.2 per cent.), but the sum received for it was £305,582 smaller (12.7 per cent.). Iron and steel showed a substantial increase, the amount being higher by 34,037 tons, and the value by £208,825. Machinery, however, was less in value by 11.3 per cent. (£171,470), although locomotives slightly increased. Cotton piece-goods improved in quantity by 6.9 per cent., though their value was practically stationary; larger shipments to China accounted for 22,000,000 out of the total of 29,176,000 yards increase. Cotton yarn and twist increased by 6.3 per cent. in amount, but in value were 7.8 per cent. less, and other cotton manufactures were worth 3.2 per cent. less. Wool rose 60.8 per cent. in amount, and 55.4 per cent. in value; woollen and worsted yarn increased 2.7 per cent. in the former respect, but declined 7.9 per cent. in the latter, while woollen tissues were almost the same as in last year. Chemical manures were half as much again in quantity, and their value was 30.3 per cent. higher, while soda compounds, with a rise of 10.9 per cent. in amount, were enhanced 27.0 per cent. in value. The exports of foreign and colonial merchandise were valued at £4,314,471; last year they were worth £5,200,525, the decrease thus being £886,054.

COLONIES.—The gold output from the mines on the Witwatersrand which have so far re-started working was 104,127 oz. of fine gold in March. In the preceding month the total was 81,405 oz. Rhodesia in March yielded 16,891 oz., as compared with 14,289 oz. in the same month of last year. The Queensland output was 60,300 oz., and Victoria produced 66,058 oz. The gold exported from Western Australia and received at the Perth mint amounted to 177,505 oz., valued at £647,895, or 49,650 oz. more than in the same month of last year.

Lord Cromer's report on Egypt has recently been published. The main heads of the Egyptian financial position for 1901 were given in last number of this JOURNAL, but the report also deals, among many other topics, with the estimates for 1902. These show a surplus of £E210,000, but this, Lord Cromer thinks, will be considerable exceeded, even though for the first time the Government has to face the payment of the annuity due for the construction of the Nile reservoirs. This actually amounts to £E160,000, but since for every £1 added to the administrative expenditure £1 has to be paid over to the Caisse de la Dette, the expenditure in which the Government is really involved is £320,000. If Egypt were not hampered by the peculiar system of accounts and estimates imposed by its international obligations, the figures for 1902 would stand:—Revenue, £E10,844,000; expenditure, £E9,900,000; surplus, £E944,000. At the same time it is satisfactory to note that for some time past the most friendly relations have existed between the Government and the Caisse de la Dette, and while the Commissioners of the latter are of course bound by the provisions of the laws by which it is regulated, they have shown a general disposition to meet proposals of the Government in a friendly and conciliatory spirit. As regards the Soudan, the finance is in a more satisfactory condition than might have been expected, although it is not yet possible to balance the Budget without a relatively heavy deficit, amounting for 1902 to £2,268,000.

The following table shows the variations which have occurred in the securities of certain Colonial Governments during the past three months:—

	25th Feb.	26th Mar.	28th April.
Canada 3 per cent.	101 - 101½	101 - 101½	102½ - 103½
Cape 3 per cent.	96 - 96½	96½ - 97	97½ - 97½
Natal 3 per cent.	93 - 94	93½ - 94½	95 - 96
New S. Wales 3 per cent.	96½ - 97	95 - 95½	95½ - 96½
New Zealand 3 per cent.	95 - 95½	93½ - 94	95½ - 96
Queensland, 3 per cent.	94½ - 95½	95 - 95½	95½ - 96½
South Australia 3 per cent.	93½ - 94	94 - 94½	95 - 95½
Tasmania 3½ per cent.	103½ - 104½	103½ - 104½	103½ - 104½
Victoria 3 per cent.	96½ - 97	96½ - 97	97½ - 97½
West Australia 3 per cent.			
(May-Nov.)	93½ - 93½	93½ - 94½	93½ - 94½

INDIA.—The fluctuations which have been recorded in the securities of certain Indian railway companies during the last three months are shown in the following table:—

	26th Feb.	27th Mar.	29th April.
Bengal and North Western	131-135	130-134	130-134
Bengal-Nagpur Gua. 4 per cent.	103-107	103-107	104-108
Bombay, Baroda & Cent. India	157-163	156-161	158-163
Indian Midland 4 per cent.	103-107	103-107	104-108
Madras Grntd. 5 per cent.	133-137	132-136	132-136
South Indian 4½ per cent. Deb.	138-143	138-143	138-143
Southern Mahratta 3½ per cent.	106-109	106-109	106-109

FOREIGN COUNTRIES.—According to a provisional report issued by the Ministry of Finance, the Russian ordinary revenue for 1901 amounted to £197,852,160—that is, an increase of £7,541,600 as compared with the estimates, and an improvement of £10,397,970 over the figures for 1900. The ordinary expenditure in 1901, amounting to £171,789,750, exhibited an increase of £14,185,820 as compared with that of 1900. The extraordinary revenue was £18,004,470, and extraordinary expenditure £18,598,140.

According to the report of the International Financial Commission for the Greek Debt, the total amount received by the Commission in the twelve months from January, 1901 to January, 1902, reached the sum of 1,131,705 gold drachmæ and 58,041,476 paper drachmæ. In the same period the expenditure was 950,004 gold and 48,893,563 paper drachmæ, the balance thus being 181,700 gold and 9,147,913 paper drachmæ. The total paid in 1901 for the service of the debt was 15,036,669 fcs. The sums paid on the coupons reached 12,251,952 fcs., of which 6,087,662 fcs. went to England,

3,131,029 fcs. to France and 2,509,030 fcs. to Germany, while 524,229 fcs. were paid to the bondholders in Greece. To the amortization of the various foreign loans, 864,931 fcs. were applied.

According to the report of the American Iron and Steel Association, the total output of Bessemer Steel ingots in the United States in 1901 was 8,713,302 gross tons. This total is by far the highest in the history of American steel manufacture, being over two million tons ahead of that for the preceding year, and over one million tons greater than the figure reported for 1899. The production of Bessemer steel rails was the largest ever reached, amounting to 2,836,273 tons, of which over 2,200,000 tons consisted of rails weighing less than 85 lb. but more than 45 lb. per yard. The largest production of Bessemer steel rails in Great Britain was in 1882, when 1,235,785 tons were turned out—less than half America's output for last year.

AGRICULTURAL RETROSPECT.

UNITED KINGDOM.—Until the middle of the month the weather of April was harsh and unseasonable, holding vegetation almost at a standstill. For the fruit trees this was no disadvantage while frosts were occurring every night, but the check to the green fodder crops was unwelcome and expensive to owners of live-stock, and especially to flockmasters. For the cultivation of the soil, however, the weather was highly favourable. The month closed with genial spring weather, refreshing rains having induced a notable rapidity of growth of crops and pastures. With regard to the re-imposition of the old duties on corn, the *Times* considers that it has occurred too late to exercise any influence upon the home acreages of our cereal crops. At any other date, however, it is doubtful if farmers would have been induced by so trivial an impost to increase the area of wheat, barley, or oats. The duty of 3d. per cwt. on imported grain is equivalent to 12·9d. per quarter in the case of wheat, beans and maize, 10·7d. per quarter on barley, and 8·4d. per quarter on oats. These values are for the Imperial quarter, that is 480 lb. of wheat, 400 lb. of barley, and 312 lb. of oats. The official weekly average prices of British corn are always quoted per Imperial quarter, and, as these prices vary sometimes in one week to a greater extent than the respective amounts representing the duty per quarter, it is hardly likely that corn-growing in this country will receive any stimulus. In replying to a question, the Chancellor of the Exchequer remarked that the British farmer can easily feed his stock with home-grown grain if he prefers it. Maize, or Indian corn, has been grown on a small scale in certain parts of England for several years, but lately British farmers seem to have given it an increased amount of attention, and the Board of Agriculture have now published a leaflet upon the subject. When grown as a green crop for fodder, maize does not demand a better climate than many districts of England are able to offer, while as regards soil requirements and expenses of cultivation it compares favourably with most of our fodder crops. In our southern and south-eastern counties, where a low rainfall, and frequently recurring periods of drought, make the growth of roots rather uncertain, maize offers the opportunity of securing a large bulk of succulent material, which may, to a considerable extent, replace the common fodder crops. The seed may be sown from the middle of May to the middle of June, but the earlier sowings are liable to injury from frost. The seed is planted to a depth of 2½ inches to 3 inches in rows not less than 16 inches apart. The quantity of seed used varies between 1½ and 2½ bushels per acre. When the young plants appear above ground horse- and hand-hoeing must be attended to, as in the case of other drilled crops; but when once fairly established, maize, being a rank-growing plant, reaching as it does a height of 5 feet or 6 feet, will largely suppress weeds by smothering them. As regards its employment, green maize is found to be very useful for scattering on bare pastures in August and September, where it is readily eaten by all kinds of stock, not excluding pigs. In America, and to some extent in this country, the main value of the crop is due to the opportunity it provides, through the agency of ensilage, of securing a supply of nutritious succulent material for use in the winter and spring months. The quality of the silage that maize produces is excelled by that of no other crop. If maize be utilized in this way it should stand till it is as mature as it is likely to become in this country, though it must be got off the fields before the occurrence of autumn frosts. A good sample of maize silage is of a greenish-brown colour, and emits an aroma almost indistinguishable from that of strong tobacco. It is much relished by stock, and seems to have a feeding value not inferior to that of mangel.

An outbreak of foot-and-mouth disease occurred at the end of March near Canterbury, after the country had been free from the disease for nearly

a year. This was a serious misfortune to flockmasters in a wide area round the infected district, owing to the severe regulations which are necessarily imposed with a view to the prompt suppression of the disease. In the *Journal of the Board of Agriculture* for March there is a useful article on "The Purchase of Artificial Manures." The various manures and their constituents are explained, and buyers are instructed in the valuation of different qualities, numerous examples being given. A buyer may sometimes be led into purchasing a manure through its nitrogen being expressed as sulphate of ammonia, or the content of potash may be made to look more attractive by being stated as sulphate of potash, though in an invoice the potash must be stated as such. The rules for approximately converting some of the terms by which the valuable constituents of various manures, as described by vendors, are given as follows: To convert nitrogen into terms of ammonia, multiply by 1·2; nitrogen into terms of sulphate of ammonia, multiply by 4·7; phosphoric acid into terms of phosphates, multiply by 2·2; potash into terms of sulphate of potash, multiply by 1·85; potash into terms of muriate of potash, multiply by 1·58.

COLONIES.—The development of cold storage systems is having a stimulating effect upon the exportation of certain classes of agricultural produce from CANADA. Improved cold storage on ocean liners has increased the export of butter from the port of Montreal alone, during the past three years, by upwards of 100 per cent. in quantity, with an increase in profit owing to the superiority of the quality of the product now landed in Britain, as compared with that under the older and less perfect cold storage system. Too much emphasis cannot be laid upon the necessity for owners of creameries to provide cold storage accommodation at them, to protect the butter in cold storage from the day after it is made; and the Canadian Minister of Agriculture has induced the Dominion Government to grant a bonus of 50 dollars for every creamery at which the owner will provide and keep in use a refrigerator-room according to specified plans and regulations. This bonus system, commenced in 1897, has been taken advantage of by the owners of about 500 creameries; and to the owners or lessees of creameries who have not hitherto obtained the bonus of 50 dollars the Dominion Government will grant a bonus of that amount per creamery if and when its owner provides and keeps in use a refrigerator-room according to the plans and regulations during the current year, and the further bonuses of 25 dollars each for 1903 and 1904 if and when the refrigerator-room has been kept in use according to the regulations during these two seasons. Thus the owner of a creamery who provides the necessary refrigerator-room and keeps it in use during the three years may receive altogether a bonus of 100 dollars. The cold storage system devised and directed by the Dominion Department of Agriculture has done much to expand Canadian commerce in food products. It has taken into account the various interests of the producers, the collecting buyers, the carriers or transportation companies, the distributing merchants, and the consumers. By preventing losses by deterioration in quality it has increased the profits of the dealers and augmented the wealth of the country. Cold storage in every phase has been tried and found effective; but as at first the volume of trade might not have been sufficient to induce business men to put up cold storage warehouses for the accommodation of products intended for export, a grant was offered to those who would provide cold storage buildings at central points, such grant being in the nature of a guarantee that the earnings from the cold storage business at these points would yield at least 5 per cent. on the cost of buildings and plant. The rates to be charged were, of course, to be satisfactory to the Department of Agriculture, and the grants from the Canadian Government were not to be called upon except to make up any deficiency between the net earnings and the sum of 5 per cent. on the cost as mentioned. Advantage was taken of this offer at Quebec only. That capital put into cold storage warehouses will prove a sound remunerative financial investment is not now open to doubt, for this system has passed far beyond the experimental stage, and outside the realm of probable failure.

The annual report of the Planters' Association of CEYLON gives the following particulars regarding some of the minor agricultural products of the island. The cacao crop of 1901 was the largest on record, namely, 47,471 cwt., and as a careful examination of the increase of acreage does not lead to the conclusion that this is to any appreciable extent caused by new land coming into bearing, it may be taken that the increase is due largely to the recovery of estates from the attacks of canker and other pests, and that, agriculturally, cacao is in a sounder position than it has been for some years. The area under cardamoms has been largely increased both in Ceylon and in India during the last two years. The exports from Ceylon in 1901 were the heaviest on record, 559,704 lb., compared with 537,455 lb. in 1900. In consequence of this increase of supply, prices have fallen considerably, and it is feared that if the production is much further increased the market will fall below remunerative prices. The exports of the products of the cocoanut palm—oil, copra, poonac (oilcake), desiccated cocoanut—show that there was no diminution in production, the quantity of desiccated cocoanut being the largest ever exported. Rubber cultivation is receiving more attention, planting is steadily increasing both in the low country and at moderate elevations. The yield and quality of Para rubber grown in the Kalutara district has been very satisfactory, some of it realising 4s. 2½d. a pound. Steps are being taken to import the seeds and plants of the best varieties of *Castilloa* into the island.

FOREIGN COUNTRIES.—According to the Buenos Ayres *Standard*, a communication from our Board of Agriculture has been received by the Argentine Government, expressing belief in the freedom of ARGENTINA from foot-and-mouth disease, and intimating that British ports will be opened to Argentine live stock in September or October, if no fresh outbreak of the disease occurs in the meantime, on condition that the law of the Republic is made to conform to that of the United Kingdom, excluding stock, carcasses, fodder, and certain other goods from all countries in which foot-and-mouth disease is believed to exist.

LABOUR RETROSPECT.

UNITED KINGDOM.—The improvement in the iron and steel trades has become more evident during the past month, and has compensated for the slackness still existing in certain other industries; so that the general state of employment is better than it has been at any time this year, and, moreover, compares not unfavourably with a twelvemonth ago. In the textile industry, the situation is not much better, but the building, furnishing, printing and leather trades all continue to improve; boot and shoe workers, however, are not well employed. It must be understood that these reports of improvement apply to the state of employment, and not to the wage rate. The dispute in the Stourbridge glass trade furnishes another example of the restrictive policy which trade unions are alleged to favour. The rupture took place on the question of promoting or appointing men to positions in the glass house. Under the system enforced by the men's society, a vacancy in a particular department had to be filled by a man from the ranks of the union, who had been brought up at this particular work, the masters being prohibited from promoting men from other departments. A system so discouraging to personal advancement has naturally been found injurious to the trade, and it is principally on this point that the masters are holding out for reform. Fortunately, there is little unfriendly feeling among the men towards their employers, the dispute being with the society itself. Messrs. Thos. Webb and Sons initiated the attempt to get rid of these restrictions, and have opened their factory with non-union labour. Other firms are following this example. Speaking recently in the Rhondda Valley, Mr. W. Abraham, M.P. (Mabon), who is recognised as one of the most thoughtful and level-headed of our labour organizers, gave an account of his recent investigations into labour matters in America. At one time, he said, he thought that working with machinery could not be to the advantage of the men he represented. He returned thoroughly cured of this prejudice. The capitalists of America would not put up with the second best of anything, and whenever new plant was invented they calculated the purchase cost to them and threw away machinery that would be used in England ten or fifteen years longer. There was no sentiment; every man was invited to ascend, and valued according to his efficiency and the wages he earned. They were strong trade unionists, and were allowed to bargain for their fellow-men with the capitalists as to the price of work, but no interference was tolerated as to the amount of work to be done. Every workman was free to do as much as he possibly could, and if he did more than an ordinary day's work he was paid a bonus.

COLONIES.—The Emigrants' Information Office have brought up to date their handbook of general information for intending settlers in the WEST INDIES, and the following is a summary of the latest and most important details:—Firstly, with regard to general openings, the sugar industry comes under consideration. This, however, requires capital and experience, and is mainly in the hands of large proprietors, most of whom have been long connected with the West Indies. All field labour, and nearly all artizan labour, is carried on by coloured workmen, who are better able than white labourers to work under a tropical sun. In BRITISH GUIANA and TRINIDAD there are occasional openings for the employment of young men as overseers on the sugar estates, at salaries of about £40 to £50 per annum with board and lodging. Such men are required to be fairly educated, and men of the farmer class are usually found to be most suitable. In no case, however, should any young man go out, except under regular engagement. There is also, occasionally, some opening for capable artizans and shop assistants, but they, too, will do well to obtain situations before going out. Persons possessing large capital will, no doubt, have the time and money to visit the West Indies and judge for themselves of their capabilities as a field for investment and a place of residence. Small capitalists with, say, £2,000 will find that these colonies offer a fair prospect of making a comfortable livelihood, but they should first work for a year or two with some planter to learn the methods of cultivation. The industries for which the islands are suited are the cultivation of fruits, such as bananas, plantains, coco-nuts (by the sea coast), limes, oranges, etc., for all of which there is an increasing market; and also tobacco, coffee, cocoa, arrowroot, indiarubber, fibre plants, spices, and in some islands (as in Jamaica) the raising of cattle, horses and mules. Intending settlers in JAMAICA would do well to communicate with the Secretary of the Institute of Jamaica, from whom can be obtained particulars of a scheme of articling pupils in farming and planting, which is intended for young men with some £2,000 or £3,000 capital, who wish to adopt an agricultural career. A settler with enough capital to combine cattle and sheep-farming with fruit and other cultivation, should do well. Properties of 200 to 1,000 acres, with house, etc., would cost from £500 to £3,000 and upwards. The outlook for fruit-growers has been considerably brightened since the starting of the direct line of steamers. Bananas yield enormous crops, and their cultivation requires less capital than most of the other crops, and is remunerative. Sugar has latterly fallen to a low position, the total value of the sugar-cane products exported during the last five years being little more than one-third of the value of bananas and oranges shipped to the United States. The causes of this depression of the sugar industry are not far to seek, and in so much as they are of local origin they are entirely remediable. There are, perhaps, four sites in Jamaica at the present time where the erection of central factories fed from a *clientèle* of contiguous estates would enable sugar to be produced at a greatly reduced cost, but on the whole the majority of sugar estates in Jamaica are of sufficient size, agriculturally, to stand on their own merits and to be capable of individual development. The sugar district of Vere is being provided with a system of irrigation. The Government chemist considers that a capitalist seeking an outlet for his money in Jamaica could find no investment so safe, certain and remunerative,

as a well-situated sugar estate managed on up-to-date lines, and with sufficient capital to work it economically. A labour trouble in LAGOS, says the Colonial Secretary, is that there are, unfortunately, few natives who take to agricultural work, and it is a deplorable fact that among the unemployed there are quite a large number of able-bodied men who, because they have been taught at school to write a few ungrammatical sentences in a fairly legible hand, consider it beneath their dignity to follow agricultural pursuits. The capacity of the country still remains undeveloped, and this class of native could, if properly trained, materially help to open up the country in this particular way. Applications for employment in the Secretariat as clerks in Government establishments are constantly being received, and it was recently suggested to a candidate that he should take up agricultural work. He was appointed a pupil on one of the model farms, but remained there only a few weeks. He resigned, stating as his reason for so doing that the work he had been given to do was far too hard and too degrading. There is great scarcity of labour in BLOEMFONTEIN, and numerous building operations cannot be commenced before the supply is improved. The proposal to utilize the Boer refugees as labourers seems likely to lead to difficulties, judging from a recent example. Four starving Dutchmen asked for charity from a philanthropic resident, who offered them a gardening job at 5s. a day each. On the first day he found the four Boers smoking under a hedge. They had hired two Kaffirs at 2s. 6d. a day to do the work for them. In JOHANNESBURG the carpenters and joiners have been out on strike, and many were able to obtain their demands, owing to the large amount of work waiting to be done.

FOREIGN COUNTRIES.—The question of the legal position of trades unions has been before the courts in the UNITED STATES, and the New York Court of Appeals has just given a ruling on the subject. According to this ruling, working men have the right to organize for the purpose of securing higher wages or shorter hours of labour, or otherwise improving their relations with their employers, and have the right to strike where their object is not to gratify malice or inflict injury upon others, but to secure better terms of employment for themselves. In course of the action which brought about this ruling, it appeared that the members of a steam-fitting association insisted that contractors should not employ the members of another association who worked for lower wages, and caused strikes which resulted in the displacement of those of whose rate of wages they complained. The association whose members were displaced secured an injunction restraining the first-mentioned association from striking or making threats to strike, but this action was reversed on an appeal, the appellate courts holding, in effect, that members of labour organizations need not work with other employees not members of their organizations, and may order a strike to enforce their demands. The Court of Appeals took the ground that the defendants had the right to strike for any reason they deemed a just one, and had the right to notify their employer of their purpose to strike. A labour organization, the Court said, is endowed with precisely the same legal right as an individual to threaten to do that which it may lawfully do. It is perhaps worthy of remark that the Court was far from unanimous on the question, the decision being reached by a majority of one. The State Labour Commissioner in his bulletin for the last quarter of 1901 says, that during that quarter only 4.6 per cent. of 97,270 members of labour organizations in New York State were idle, as compared with 8.5 per cent. for the same 188 unions in the corresponding period one year ago, when the idleness was less than it had been in any of the preceding years. Similarly the proportion of members idle at the end of December declined from 25.7 per cent. in 1900 to 19.1 per cent. 1901, the decreased idleness being particularly noticeable in the building, clothing and baking trades. At the end of January, 1902, there was a small decrease in employment in the building and furniture trades, which caused the average proportion of the unemployed in all trades and industries to rise to 20.9 per cent. In 1901, 47,585 members of labour unions obtained advances in wages, as compared with 2,068 who sustained losses. The average per capita weekly gain of the former was \$1.97 and loss of the latter \$2.67.

In ITALY a new Law on Emigration has come into force, and has introduced so many and important changes that it will mark an epoch in the annals of Italian emigration. The law establishes, first of all, a separate Government Commission to control emigration in all its branches, and to have a special care for the interest of the emigrant himself. An emigrant is defined to be a third-class passenger. Emigrants may start from three Italian ports only, Genoa, Naples, and Palermo, at each of which an inspector of emigration appointed by the Commission is stationed. Besides the ship's doctor who is appointed by the steamship company, each emigrant ship carries an Italian naval surgeon whose duties, besides the medical care of emigrants, are to ensure the proper carrying out of all the requirements of the law during the voyage. No persons may book or engage emigrants who have not obtained a licence from the Commissioners. Foreign steamship companies may become agents provided that they nominate an Italian subject or legally constituted Italian firm as their representative, and provided that they submit to all Italian laws and regulations as regards the actual operations of emigration. Public inducement to emigrate is prohibited, and no tickets may be issued without the production of a passport by the intending emigrant. The law contains numerous articles to protect the emigrant from imposition, to limit his responsibility in case of inability to sail after once booking his passage, to determine the indemnities to which he is entitled in case he does not obtain his passage, and further to specify how disputes between the agent and the passenger are to be settled. The agent has to pay a Government fee of 6s. 8d. per adult passenger, which goes to form an emigration fund to meet the expenses of the commission and the offices connected with it. In the countries to which Italian emigration is most specially directed, as, for instance, the United States, Brazil, and the Argentine Republic, the Government will arrange for the institution of offices for the protection and information of emigrants and establish a labour bureau with travelling inspectors. Another novel feature in the law is that the same protection is accorded to Italians returning to their own country as to those that are leaving it. This is an important matter, as the statistics show that the number of returning emigrants who have made money, is equal to the number of those who go out to seek their fortune.

Disturbances, originating with the Socialists, occurred in BELGIUM and resulted in a general strike in Brussels, followed by a rapid-extension of the

movement to the chief industrial centres, Charleroi, Liège, Verviers, and the coal district of Le Borinage. At one time some 200,000 men were estimated to have left their work throughout the country. Serious conflicts took place between the rioters and soldiery. On the 20th of the month, the Labour party adopted a resolution that work should be resumed. Unfortunately it is highly probable that the lull in this Socialistic movement is only temporary.

SCIENTIFIC AND TECHNICAL DEPARTMENT OF THE IMPERIAL INSTITUTE.

REPORT ON SPECIMENS OF EAST INDIAN WALNUT.

(By MR. HERBERT STONE, F.L.S., F.R.C.I.)

The following report of the examination of specimens of East Indian walnut has recently been made by Mr. HERBERT STONE, one of the Imperial Institute expert referees on timbers. In his report Mr. Stone says :—I have carefully examined and tried the sample slabs of *Albizia lebbek*, or East Indian walnut, otherwise known as “koko,” and am favourably impressed with the wood, as it is fully equal to the American black walnut (*Juglans nigra*) which is now so largely used in England, and I think it would compete on equal terms with that wood. It is certainly heavier and varies considerably, amongst the 13 specimens one or two being rather heavier than is desirable for a furniture wood. It possesses a good figure which runs curly at times, in which case the appearance is very fine, and though not possessing much lustre when straight-grained, it has a “watered” appearance when curly in the grain. Taking plain and choice specimens together it shows about the same range of figure as the above-mentioned American walnut.

I make my comparison with this wood, as it is the one whose place it must occupy, for I do not think it would compete with English or Italian walnut (*Juglans regia*). The mechanical tests I have applied are sawing, planeing, turning by power and polishing by hand. I find that it comes up to a better surface, with rather less trouble, than the American wood, and can be worked as fast and with the same ease. In finishing it requires less preparation by means of glass-paper, as the wood is denser, but as the grain is very coarse it requires much filling, and the pores are lined with a quantity of soft tissue which absorbs much polish and hence occupies much time. I consider that as good a finish can be obtained in about the same time as with the black walnut. I do not doubt that a market can be found for East Indian walnut in England, and I consider that ordinary straight grained sound boards and planks should be worth 2s. 6d. per cubic foot at London or Liverpool. Choice logs would probably fetch higher prices up to 4s. 6d. per cubic foot. It is as well to mention that until the wood becomes known on the English market remunerative prices should not be looked for. A new wood is nearly always imported for a time at a loss.

The specimens examined were :—

I. I. No.	Indian No.	Whence Received.	Remark.
5,526	2,914	Satara, Bombay	Rather a poor specimen, poor in colour and the hardest of the series. Works well.
5,525	2,913	Haveli, Poona	A good specimen although from a very small tree; very fair colour; works better than the average.
5,889	3,277	Surat, Bombay, marked “Maghrech Bilimore.”	Planes like American walnut and well. Poor in colour, streaky and of little value.
5,505	2,893	North Kanara, Bombay .	The best specimen, rather redder in colour, nice straight grain; works excellently. A fine piece of wood.
6,129	3,512	West Khandesh, Bombay	Works well, rather hard, good colour rather streaky, of a rather purplish cast.
5,504 A	2,892 A	South Arcot, Madras . .	Works well, rather streaky, moderately good only; hard.
5,504 B	2,892 B	Do. . . .	A fine piece of curly, figured wood, but heavy and the hardest of all; good colour.
5,506	2,894	Tellicherry, Madras . .	A fair specimen, but good and of fair colour. Works well.
6,127	3,509	Ganjam, Madras	A good plank of good colour, even grain, very heavy. Works well.
4,938	2,656	Tenasserim, Burma . . .	A poor plank of inferior colour, streaky; works well but with an unpleasant, sneeze-provoking dust.
6,275	4,789	Mandalay, Burma, marked “Dharwar.”	A poor specimen, rather light indifferent colour, works badly. Probably immature and a little tainted with decay.
4,937	2,655	Thayetmyo, Burma . . .	A good specimen of fair colour, coarse in the grain; works well.
6,126	3,508	Minbu, Burma	A quite useless plank, badly tainted, defective and of extremely bad colour. Works well notwithstanding.

THE PREVENTION OF “SMUT” IN OATS.

The disease known as “smut” in oats is very prevalent in the western districts of Ireland, where from 10 to 50 per cent. of the crop is not infrequently destroyed by it, and consequently an investigation has been carried out by Dr. T. Johnson, on behalf of the Congested Districts Board, with the object of finding a suitable remedy. The results of the work were recently communicated to the Royal Dublin Society, and the paper is reproduced in the *Journal* of the Department of Agriculture for Ireland (March, 1902).

The disease is caused by a fungus, *Ustilago avena*, which attacks the young oat plant, but whose presence is not revealed until the grains are being formed. The latter, in infected plants, become black owing to the formation of the dark-coloured spores of the fungus, and gradually the whole of the tissue of the grain is replaced by a loose mass of the spores, which are scattered by the wind, thus spreading the infection. Even when the grain is not completely destroyed it is rendered quite useless, either as food for man or beast, or for sowing purposes. It has been found, however, by previous workers that the oat plant is only liable to attack by the fungus when in the seedling condition, and that if it can be safely carried beyond this stage there is practically no further risk of infection. When infected oats are used for seed, however, the “smut” spores are present on the surface of the grains, and when germination takes place the hyphæ of the fungus penetrate the delicate tissue of the seedling oat and later bring about the destruction of the crop. It is important to notice, too, that the presence of even a few ears of smutted oats will contaminate a large stock and produce widespread damage to the

next crop. The treatment usually adopted in such cases is to soak the seed, before sowing, in some fungicide which will kill the adherent spores without affecting the vitality of the grain, and many methods for attaining this object have been suggested. But even when the whole of the adherent spores have been destroyed there is still left another possible source of infection. The soil of a field, which has borne a crop of smutted oats, will contain large numbers of the spores, and these sometimes retain their vitality for several years, besides being capable of germinating on the decaying organic matter present. If, therefore, grain which has been freed from “smut” spores by treatment with some fungicide be sown in ground containing spores left from a previous crop, there will still be considerable danger of infection, and, in order to reduce the chances of this to a minimum, at least three years should elapse between successive sowings of oats on the same field wherever smut is prevalent. A moist climate is very favourable to the fungus, and this may possibly account for the prevalence of the disease in the west of Ireland.

It was found on enquiry that in many of the badly affected districts in Ireland the seed used by the farmers was saved from year to year from their own crops, and that no attempt of any kind was made to prevent the recurrence of the disease. A quantity of infected grain was, therefore, procured from Co. Donegal, and, after tests to make sure that the oats were smutty, a series of experiments was instituted in order to determine the most suitable fungicide for use. The following table gives the particulars of the different methods tried :—

No.	Fungicide.	Strength of Solution.	Time of Immersion.
1	“Sar” or sodium sulphide solution	0·5 per cent., i.e., 1½ pints of sar in 50 gallons of water	24 hours
2	Potassium sulphide	0·5 per cent., i.e., 1½ lb. of the sulphide in 25 gallons of water	24 hours
3	Copper sulphate	0·5 per cent., i.e., 1 lb of the sulphate in 22 gallons of water	12–16 hrs.
4a	Formalin	0·2 per cent., i.e., 1 lb of formalin in 50 to 60 gallons of water	2 hours
4b	Formalin for 2 hours as 4a followed by ammonia	0·2 per cent., i.e., 1 oz of ammonia in 4½ gallons of water	15 min.
5	Hot water	132° F.	10 min.
6	Control	Not treated	

The first of these, the “sar” solution, has been strongly recommended as a fungicide by the United States Department of Agriculture, and its method of preparation is given in the paper. A stronger solution than that given in the table can be used, but in that case the time of immersion must be reduced; thus, when one gallon of “sar” is used to 50 gallons of water the seed is only soaked for two hours. This also applies to the use of the potassium sulphide solution (No. 2), in which case it was found that immersion for the shorter period in the stronger solution was quite as effective, did not lessen the germinative power, and the grains dried more quickly. The treatment by steeping in the copper sulphate solution proved too strong, as the seeds afterwards possessed a very low germinative power when tested in the incubator, and this was fully confirmed by the subsequent field experiments. This result agrees with American experience, and it is suggested that, if copper sulphate is used as a remedy for “smut,” the grain should not be steeped in the solution, but only sprayed with it and afterwards treated with lime. Treatment with formalin has been stated to lessen the germinative power of the oat, and for comparison some of the grain so treated was afterwards placed in a 0·2 per cent. solution of ammonia for 15 minutes, as recommended by David. The germination of both lots was then tested in the usual way, and found to be 99 per cent. in the case of treatment with formalin alone and 96 per cent. in that of formalin followed by ammonia. A very cheap and effective method of treating smutted oats is the one introduced by Jensen, in which the infected grain is immersed in water at 132° Fahrenheit for ten minutes, but this to be successful requires to be very carefully conducted. If the temperature is a few degrees too high or the steeping is continued too long the oats, as well as the spores of the fungus, will be killed, while, on the other hand, a temperature much below 132° Fahrenheit is not fatal to the spores. The method is, therefore, not so simple as the others, and could not be recommended for general adoption in the west of Ireland.

After treatment with these different fungicides samples of each of the six lots were sent to three districts in the west for a practical test and, in addition, small control experiments were conducted at the Royal Botanic Gardens, Glasnevin. The samples were sent out simply numbered, and no information was given regarding the treatment which they had undergone. In all cases the beneficial effect of treatment with a fungicide, except copper sulphate, was clearly proved, as will be seen from the results of the larger experiments given below, in which the numbers correspond to those of the previous table.

GRAIN.

Yield per Acre in lb.					Standard Smut-free Crop.
No.	Clifden (Co. Galway.)	Tourmakeady (Co. Mayo.)	Ardara (Co. Donegal.)	Average.	
1	1,650	1,370	2,240	1,750	1,600 to 3,200 lb. (40 to 80 bushels) per acre.
2	1,800	1,850	3,168	2,270	
3	1,380	1,250	1,872	1,500	
4	1,550 (b)	1,240 (a)	2,240 (a)	1,676	
5	1,920	2,000	2,080	2,000	
6	1,120	1,330	2,080	1,510	

STRAW.

1	3,840	1,720	4,432	3,330	2,800 to 5,040 lb. (25 to 45 cwt.) per acre.
2	4,160	2,090	5,760	4,000	
3	3,820	1,840	4,256	3,305	
4	3,680 (b)	1,610 (a)	4,432 (a)	3,240	
5	4,240	2,250	4,230	3,573	
6	3,040	2,150	4,430	3,206	

In each case the official in charge of the experiments reported that No. 6, which had not been treated in any way, was quite as badly affected with “smut” as the farmer’s ordinary crop, whereas very little disease developed in any of the treated samples, and at Tourmakeady No. 5, which had been treated with hot water, was quite free from “smut.” In addition the straw from No. 1 to 5 was of excellent quality, while that from No. 6 was very inferior and badly contaminated with smut spores.

These results were so satisfactory that it was decided to distribute some fungicide to the farmers themselves for trial, and for this purpose “sar” was chosen as being very effective and

at the same time cheaper and keeping better than potassium sulphide. In all, 55 separate tests were made in the counties of Galway, Mayo and Donegal, and in each case two plots were sown with smutted grain of the previous year, one after treatment with the fungicide, the other without such treatment, so that a direct comparison was possible. The results again proved most satisfactory; in every district but one the crop from the treated grain, was either entirely free from smut or was very much less affected than that from the untreated grain, which in many cases was so bad as to be useless. It was noticed, too, that the treatment with "sar" appeared to strengthen the plants and certainly hastened germination, so that the oats may be advantageously sown the same day they are soaked, after a few hours' drying. In one case it was found that grain soaked in a solution which had been previously used did not give such a good result as the first lot, but was better than that which had not been steeped at all. Only in the Westport district of Co. Mayo was "smut" plentiful on both the treated and untreated plots, and here the rotation of crops is simply oats and potatoes, so that land which carried oats in 1899 was again employed in 1901 for the same crop. If the grain used was effectively soaked the infection would appear to have come from the soil, and the necessity of allowing an interval of at three least years between the crops is emphasised.

These experiments conclusively prove that "smut" in oats, hitherto so prevalent in the west of Ireland, can be almost, if not entirely, prevented by a cheap and simple treatment of the seed oats with some fungicide, such as "sar" or potassium sulphide solution. The former appears to be the more convenient for general use, and in one day two men can treat enough oats to sow 20 acres, the cost of the solution required being only from 1/- to 1/6 per acre, whereas the yield may be increased to 40-80 bushels per acre instead of half these quantities. The farmers were greatly impressed by the success of the experiments, and there is every probability that the treatment will be widely adopted in the future.

THE EMPLOYMENT OF CATALYTIC METHODS IN CHEMICAL MANUFACTURES.

The term "catalysis" was first employed by the Swedish chemist Berzelius to describe a group of reactions in which some substance appeared to bring about a chemical change without itself undergoing any alteration. A familiar example of such a catalytic action is to be found in the operation of a certain form of automatic gas-lighting apparatus, consisting of a small plate or sponge of platinum, or asbestos coated with a thin layer of platinum black, and suspended just above the gas jet. When the latter is turned on the gas impinges on the platinum black or sponge, the latter becomes incandescent and so inflames the issuing gas. The platinum black in this instance of catalytic action enables the oxygen of the surrounding atmosphere to combine with the carbon and hydrogen of the coal-gas, *i.e.*, to burn the latter, but is itself quite unaltered and retains this property for unlimited periods, provided the platinum be raised to incandescence from time to time. At first it was supposed that reactions of this kind were comparatively rare, but recent investigations have shown that catalysis plays a very important part in bringing about chemical changes, and attention has thereby been directed to this subject both from the technical and scientific sides. Professor Ostwald, of Leipzig University, has recently, in an address delivered to an assembly of medical men and naturalists at Hamburg, discussed the various explanations which have been offered as accounting for obscure reactions of this nature, and has shown that, in general, catalysis is merely produced by a great increase in the velocity of a reaction already proceeding; *i.e.*, in the example already given, the gas would be slowly oxidised by the oxygen of the atmosphere alone, but the presence of the platinum black induces a great increase in the rate of this oxidation and so causes the lighting-up of the plate and the inflammation of the gas. Ostwald, therefore, defines catalytic actions as those changes brought about by agents capable of affecting the velocity of chemical reactions without themselves appearing in the final products. These agents are conveniently termed catalysts. Accepting this definition it will be seen that a very large number of chemical reactions are included under this heading; thus, the changes brought about by enzymes or unorganized ferments, such as the conversion of starch into sugar, which occurs in the malting of barley, the conversion of food stuffs into soluble peptones and amides by the agency of pepsin and trypsin in animal metabolism, and the fermentation of sugar solutions by the enzymes of yeast with the formation of alcohol, are all examples of catalysis. Similarly a large number of reactions are known in which minute quantities of water and mineral acids are necessary agents: thus, the conversion of starch into glucose is carried on, on an enormous scale, in the United States and is generally brought about by boiling the starch with an infinitely small amount of mineral acid, the latter undergoing no change in condition or quantity during the process. During the last few years it has been shown that many chemicals which readily react with each other in a moist condition, are inactive when perfectly dry; thus, mixtures of oxygen and hydrogen are not explosive when thoroughly dried, but the introduction of a mere trace of moisture into the mixture restores this property. In these cases the small quantities of water, mineral acids and enzymes are to be regarded as true catalysts.

Turning to the industrial applications of this property an excellent *resumé* of technical catalytic actions is contained in a lecture recently given by Dr. Conroy to the Liverpool section of the Society of Chemical Industry and printed in the current number of the Society's *Journal* (March 15, 1902), and from this source the following abstract has been compiled:—

SULPHURIC ACID.

The material employed as a source of sulphur for the manufacture of this acid is iron pyrites which, when burned in an unlimited supply of air, furnishes sulphur dioxide, and the latter by further oxidation yields sulphur trioxide, which when dissolved in water constitutes sulphuric acid. The most difficult step in this series of operations is the oxidation of the sulphur dioxide, and this is brought about at the present time in most vitriol works by the combined action of nitric oxide and atmospheric air in large specially constructed leaden chambers. In this process the first material obtained is a weak, impure sulphuric acid, which requires to be concentrated before it can be sent into commerce. During the last few years processes have been elaborated in Germany for the oxidation of sulphur dioxide, produced from burning pyrites, with the aid of platinum black and similar catalysts. It has long been known that by passing mixtures of sulphur dioxide and atmospheric air over asbestos coated with platinum black, sulphuric acid could be obtained, and this is the principle underlying the new process, but much investigation has been necessary in order to secure satisfactory working on the industrial scale. It was found that the efficacy of the platinum was rapidly reduced by impurities in the mixed gases passing from the pyrite burners, and so it was necessary to purify these from arsenic and other substances by passing them through a system of cooled pipes and eventually through concentrated sulphuric acid, before bringing them into contact with the heated platinum. The latter is generally employed in the form of platinised asbestos, but other forms have also been used, such as pumice stone impregnated with platinum-black, etc. The temperature at which the platinum must be maintained is also an important matter, since this greatly affects the yield of acid obtained; the limits appear to lie at 200° C. and 1,000° C., the best temperature being from 400° to 500° C.

In spite of the many difficulties experienced in working this process it appears to be efficient and cheap, since one of the most important chemical firms in Germany has abandoned the lead chamber process in favour of this method, and now converts about 80,000 tons of iron pyrites into sulphuric acid per annum by its aid.

CHLORINE AND CHLORINE PRODUCTS.

The most important catalytic method of obtaining chlorine is the long-established Deacon process, which depends upon the decomposition of hydrochloric acid into chlorine in presence of cuprous chloride and atmospheric air at a temperature of 450°-500° C. This process, however, depends upon the Leblanc process of soda manufacture, in which hydrochloric acid is obtained as a bye-product, and since this method of alkali manufacture is now gradually being replaced by electrolytic methods in which chlorine itself is a product, the importance of the Deacon process is likely to decline in the future. As an adjunct to the electrolytic process for the decomposition of sodium chloride into caustic soda and chlorine, there will probably arise in the future a necessity for a method of converting chlorine into hydrochloric acid; several patents for this purpose have already been taken out, but so far none of these have been successfully worked. Pataky (Eng. Patent 1900, 1831) has proposed to reverse the Deacon process by passing chlorine and hydrogen over charcoal heated by means of a water bath, and Lorenz (Eng. Patent 1894, 25,073) has found that the interaction of chlorine, carbon and super-heated steam gives, under certain prescribed conditions, a satisfactory yield of hydrochloric acid, whilst at a French electrolytic soda works, part of the chlorine is stated to be converted into the acid by burning a jet of hydrogen in it.

An account of the development of methods for the electrolytic production of chlorates has already been given in this *JOURNAL*, Vol. VII., p. 96, but it may be pointed out here that it has recently been observed by Imhoff that the yield of chlorate obtained by direct electrolysis of chlorides is greatly increased by adding to the bath a small quantity of a soluble chromate, thus the yield of potassium chlorate for the same current employed in a 30 per cent. solution of potassium chloride can be increased from 32 to 69 per cent. by the addition of 18 per cent. of potassium chromate.

So far no salt but the chromate has been found to produce this effect, the corresponding manganese salts having no influence, whilst, curiously enough, cobalt salts prevent the formation of chlorate entirely.

FORMALDEHYDE.

This substance has during recent years come into extensive use as a disinfectant, and is commonly produced by means of the so-called formaldehyde lamps. The latter depend for their efficacy on the production of methyl alcohol vapour, which issues from a fine jet and impinges upon a small sponge of platinum black, which is at first slightly heated in order to start the action. Once started, the oxidation of the spirit to formaldehyde proceeds automatically, the heat of the reaction maintaining the platinum at a sufficiently high temperature to effect the change.

This method has also been applied to the production of other organic substances, but not on a large scale; thus, Trillat has obtained vanillin, the odorous principle of vanilla beans, from isoeugenol by this means, whilst Ipatiew, by a somewhat similar method, has prepared benzaldehyde, acetone and other substances from the corresponding alcohols.

CARBON TETRACHLORIDE.

This material is of considerable importance in the arts as a solvent of rubber, gutta-percha and similar substances and, unlike most solvents of these bodies, is not highly inflammable.

It is usually prepared by the action of chlorine on carbon bisulphide, but at ordinary temperatures practically no action occurs between these substances, except in the presence of certain catalytic agents of which iodine, antimony and aluminium chlorides, bromine, and even finely divided iron, have been successfully employed on the large scale.

In addition to the organic compounds already mentioned as produced by catalytic methods, attention may be drawn to the oxidation of naphthalene to phthalic acid by means of hot sulphuric acid, which forms the first step in the complicated process by which synthetic indigo is made. This reaction only proceeds easily in presence of metallic mercury or one of its salts. A similar influence of mercury in a reaction of this kind has been recorded by Rosenthal (German patent 127) in his investigation of the oxidation products of aromatic amines.

Many of these reactions are at present inexplicable, but it is very probable that they are to be accounted for by the alternate formation and decomposition of compounds between the catalyst and the substance undergoing change. The utility of platinum and palladium in such actions is no doubt associated with the property possessed by these metals of occluding oxygen, hydrogen, and other gases, the latter appearing to be more active in the "occluded" condition than in the free state.

NATURAL GAS IN ONTARIO.

The first search for natural gas in Ontario was made in 1888 by the Ontario Natural Gas Company, and a well was put down near Ruthven, which struck gas at a depth of 1,020 feet in the upper bed of the Guelph formation, and the yield at the commencement was a little more than 10 million cubic feet of gas per day. After the well was tubed and the gas shut in, it registered a rock pressure of 460 lb. to the square inch. This well opened up the Essex County gas field, now supplying gas to the cities of Windsor, Detroit and Toledo. The second well, drilled in the following year, opened up an entirely new field in the County of Welland, seven miles from east of Port Colborne. This was opened with a view to supplying the city of Buffalo, and the gas was struck in a white sandstone of the Medina formation at 836 feet from the surface. The flow from the well at its mouth measured 1,700,000 cubic feet per day, with a rock pressure of 525 lb. per square inch. 142 wells have since been drilled in this field at a total expense of \$703,000, and the gas has supplied Fort Erie, Bridgeburg and Buffalo.

The following table shows the strata passed through in the first gas well of the Essex field, which was called the Coste Well:—

Formation.	Strata.	Thickness.	Depth.	—
Onondaga	Soil	5 feet to	5 feet to	
	Drift, grey sand	115 feet	120 feet	
	Brown and grey dolomitic limestones with gypsum and flints	380 feet to	500 feet	
Do.	Grey blue, shaly and drab dolomites with gypsum	360 feet	860 feet	
Do.	Dark brown dolomites and gypsum	160 feet	1,020 feet	
Guelph	Grey blue crystalline vesicular dolomite	11 feet	1,031 feet	

The principal features revealed by this and other sections are that in the south and south-east part of the county of Essex, along Lake Erie, the first formation met with under the sand drift is the Onondaga and that a fault runs in a direction N.N.W. to E.S.E., passing a little north of the Coste Well, where the dip of the strata is 80° to the horizon. An extensive bed of gypsum 10 to 20 feet thick is found in the lower part of the formation; oil has not been found in payable quantity.

The formations occurring in the Welland County field are given in the following table :—

Formation.	Strata.	Thickness.	Depth.	—
Corniferous	Soil	2 feet	2 feet	
	Dark grey limestone. .	23 feet	25 feet	
Onondaga	Grey and drab dolomites, black shales and gypsum	390 feet	415 feet	
Guelph and Niagara	Grey dolomites	240 feet	655 feet	
Niagara Shales.	Blue Shales	50 feet	705 feet	
Clinton	White crystalline lime- stone, shaly towards bottom	30 feet	735 feet	
Medina	Red, blue and white sand- stones	98 feet	833 feet	
Do.	White sandstone	13 feet	846 feet	Gas at 836 ft.

In another well gas was not obtained from the Medina formation, but from the Trenton at a depth of 2,940 feet. The strata dip uniformly to the south and south-east at about 35 feet to the mile. Salt water is found in large quantities towards the middle of the Guelph and Niagara formation. According to the view of Mr. Eugene Coste the origin of this natural gas and petroleum is volcanic and not organic, and he states that he located the only two fields found in Ontario by mapping out the probable continuation of those fissured and fractured zones of the gas and oil fields of the United States, and he considers that the fact that the occurrence of gas is not confined to certain strata another proof in favour of the volcanic theory, these porous strata being simply reservoirs into which emanations of gases and petroleum from below are poured. The strata of the Ontario fields belong to the Silurian system, those of the United States to the Lower Carboniferous or older formations, and the decomposition of organic remains of the Cambrian and Lower Silurian ages is quite inadequate to explain the production of the enormous quantities of petroleum and natural gas found, for instance, in the Trenton or Lower Silurian limestone of Ohio and Indiana. What is considered a direct proof of volcanic origin is the fact that pressure is always greater in the older formations, showing that it is reduced by the friction caused in passing through the small fissures and pores of the rocks. The existence of the fields on the volcanic theory is explained as follows : That volcanic action is, and has been through all geological ages, shifting and intermittent along the fractured zones of the earth's crust, and it is well known that these deposits are localized and accidental, as for instance in the state of Ohio, where so many wells have been drilled all over the State, it is only in a very limited area in the N.W. part that 200 million barrels of oil and enormous quantities of gas have been produced during the last twelve years ; yet in many other counties of the State the same fossiliferous strata have been proved to be barren of hydro-carbon products. A final argument in favour of the volcanic theory is the analogy between the products of well-known volcanic emanations, such as fumaroles, solfataras, which consist largely of alkaline chlorides, hydrogen sulphide and hydro carbons, and those of different gas and oil fields. In association with the gas and oil there is found a bitter, salt water which is very often sulphurous. Sulphur also occurs in some of the oils and often in the natural gas as hydrogen sulphide. That of the Guelph dolomite of Point Abino, Welland County, has the following composition :—

Hydrogen sulphide	74 per cent.
Nitrogen	2.69 „
Hydrocarbons of the paraffin series	96.57 „
	100.00

The evidence appears conclusive that these mineral forms of carbon have been brought in their deposits, as most minerals have, under the influence of volcanic action.

COTTON CULTIVATION IN TOGOLAND.

Attention has already been directed in this JOURNAL to the increasing interest in the exploitation of its colonies now shown in Germany, and some account of the various exploring expeditions organised by the German Colonial Economic Committee to improve the cultivation of various products, and to introduce new staples into their colonial possessions, has been given (IMP. INST. JOURN., Vol. VIII. p. 98). Among these expeditions is one having for its object the extension of cotton cultivation in Togoland, of which a report on the work accomplished during the first year has now appeared as a special supplement to the *Tropenpflanzer* for March, 1902. At the present time the cotton-spinning industry of Germany depends for its supplies of raw material principally upon the United States of America, the imports from India and Egypt being comparatively insignificant, and this state of things is, in the opinion of German cotton-spinners, unsatisfactory, since the industry is always at the mercy of a foreign Government. The German Colonial Committee in 1900 therefore proceeded to organize an expedition to proceed to Togoland, which was the most promising of the German colonies for the purpose, and carry out there a series of experiments on cotton cultivation. The money necessary for equipment and maintenance was obtained in the form of subscription from firms interested in the German cotton trade and in the development of the colony, but principally by means of a lottery promoted by the German Colonial Company.

The leader of the expedition was Mr. James Galloway, formerly director of the cotton planting school of the Tuskegee Industrial Institute of Alabama, and he took with him several graduates of this Institute who had had experience of cotton-farming in the United States.

The expedition left Hamburg on November 21, 1900, and reached Lome, the capital of Togoland, on December 30 of that year, and immediately proceeded into the interior to select a suitable place for the experimental plantation, which was ultimately stationed at Tove-Djibe. About 100 acres of land were cleared with the help of natives, and attempts were made to plough the land in the usual manner, but great difficulty was experienced in maintaining horses and cattle owing to the ravages of the Tsetse fly.

Cotton seed brought from the United States was planted at intervals of about a month from March to June, and grew on the whole very well. From June to August various sorts of native, American and Egyptian cotton were planted, for purposes of comparison. The climatic conditions up to July were satisfactory, but at that time heavy rains followed by fogs were experienced until November, when the weather improved considerably, and ultimately good crops were obtained from the plots sown in the late summer.

Difficulties were also experienced in operating the gins for the extraction of the fibre, but eventually a power of the kind formerly used in Alabama was constructed and worked by 24 natives in place of the usual 2 horses. Next year it is proposed to import a 10 horse-power locomobile to do this work. Altogether 23 bales of cotton were prepared, 13 from native seed, 9 from American, and 1 from Egyptian seed.

The experiments have, of course, been in operation for too short a time to permit of conclusive results being obtained from them, but the report states that there is every prospect of cotton cultivation proving a successful industry in the colony, provided proper railway

and market facilities are secured and the cultivation be carried on by modern methods. The chief recommendations offered by Mr. Galloway are that attempts be made to improve the hardier and better qualities of native cotton by crossing these with American plants. The former yield on an average rather less than 28 per cent. of fibre from each pod, whilst in America the yield is generally 33½ per cent., but apparently the native cotton is of better quality than can be raised from American seed in the colony. It is also suggested that a railway should be laid, connecting up the best centres for cotton plantations, that good roads should be made, and markets opened at various townships. The cost of cotton exported from the colony to Bremen is, on the present method of working, calculated to be £12. 15s. per bale of 500 lb., but with the introduction of steam power to work the gins and oil presses, this price would be reduced to £10. 5s. per bale, whilst if the productiveness of the cotton plant can be increased to 33½ per cent. of the seed cotton the price can be reduced still further to £9. 10s. These latter values, if they can be realised, compare very favourably with the average price paid in Germany for cotton at present, which is about £11. 5s. per bale.

Specimens of the cotton obtained in these experiments have been submitted for valuation to the Bremen Cotton Exchange, with the result that the native cotton was valued at £9. 10s. per bale, whilst that raised from American and Egyptian seed was appraised at from 15 to 25 per cent. less, *i.e.* the cotton under present conditions is raised at a loss of at least £3. 5s. per bale. The experiments are, however, regarded as so satisfactory that an expedition has been fitted out to survey the colony, for the railway recommended by the cotton experts, the funds having been raised in the manner already described for the cotton expedition, whilst inducements are being offered to cotton farmers from Texas and Alabama to emigrate to Togoland.

A number of English planters in the neighbouring colony of Lagos, following the example of the Germans, have also taken up cotton cultivation on a large scale, but so far no information as to their success or failure is available, but it is principally to secure advantageous competition with this source that the railway through Togoland is being so strongly advocated in Germany.

IMPROVEMENT OF AGRICULTURE IN INDIA.

The Provincial Governments of India have in recent years made great efforts to induce the native farmers to modernise their methods, and, with this end in view, have established experiment stations and schools of agriculture at convenient centres, where field experiments are carried on and students are initiated into the application of scientific methods to agricultural work. These efforts, however, do not so far appear to have met with the success they deserved, and in the North-Western Provinces it has been considered necessary to re-organize to some extent the work of the Agricultural Department and to establish a closer connection between it and the Court of Wards, whose officials control much of the agricultural work in these provinces. As one result of this concentration, it has been found, in the opinion of Mr. Moreland, Director of Land Records and Agriculture of the North-Western Provinces and Oudh, that much of the experimental work has been of too spasmodic a character to impress the native cultivator, who, at once conservative and poverty-stricken, is backward in imbibing new ideas, and loth to incur expenditure in applying them. The Director has now issued a pamphlet calling the attention of landowners to the help which they can give the Department in this work, and discussing *seriatim* the best methods of organizing schemes for agricultural improvement in the districts in which they possess influence with the native farmers. The gist of the Director's suggestions on these various matters is given in the following paragraphs.

THE INTRODUCTION OF NEW CROPS.

The improvement in quality of the various crops raised in the provinces, it is suggested, could be best brought about by the landowner or his manager growing special varieties at his own expense and submitting these to the inspection of farmers on the estates, who should then be induced, if possible, to undertake experiments with the new crops on their own ground, seed being supplied to them at a rate somewhat below the market value. A list of crops suitable for such experiments in the North-Western Provinces is given in the pamphlet, and includes such varieties as the

Muzaffarnagar White Wheat, which has established for itself a reputation for fertility and drought- and rust-resisting qualities in Egypt and Australia.

Oats.—Certain varieties imported from Canada and the Cape are recommended for cultivation in horse-breeding districts.

Maize.—The Jaunpur variety is recommended in preference to any of those imported from America, since the latter have so far not done well in India.

Juar (Great Millet).—Experiments with several varieties of this plant are now in progress, but at present it is impossible to recommend one in preference to another.

Among other plants suggested for cultivation, but with which great care must be exercised, as they require more skilful management than is usually available in India, are potatoes, tobacco, and sugar cane. Experiments are also being undertaken by the Department on the cultivation of the Egyptian long-staple cotton, and it is now ready to advise cultivators with regard to this plant.

AGRICULTURAL IMPLEMENTS.

The substitution of modern implements for the crude apparatus now employed by the natives would do much to improve the position of the farmer in India. The Cawnpore experimental station is endeavouring to bring such a change about by lending, for demonstration purposes, various machines, but the Director believes that more good would result from this work if competent men were in all cases sent with the implements in order to ensure the satisfactory working of the latter when brought under the notice of the farmers. Among the machinery to which special attention is directed are ploughs and water lifts, chain pumps, and self-emptying buckets, the three last being very important improvements in a country like India, where artificial irrigation is necessary.

UTILIZATION OF WASTE LANDS.

The waste land in India may be divided into three classes : *usar*, or alkali land, ravines, and *bhur* or sandy land. The utilization of soil impregnated with alkali has been attempted with some success in the United States and in India. At the present time experiments are being carried out in the latter country on the cultivation of the "babul" tree, which affords good timber and a tanning material, on these alkali soils, but so far no definite results are available. The Agricultural Department is prepared to examine and give advice regarding the reclamation of such lands.

With regard to ravines, a short description of the silt-trapping method of dividing up the ravine by the gradually accumulating silt carried down by the river is given, as well as of the method of terrace cultivation, which is the more satisfactory, but requires the outlay of a considerable amount of capital.

The gradual utilization of *bhur*, or sandy soil, can only be successfully undertaken where a plentiful supply of organic manure is available, such as the drainage from a village. In certain districts in Oudh, excellent results have already been secured from waste land of this description by the application to it over considerable periods of such refuse matter.

Attention is also drawn in the pamphlet to the utilization of refuse of all kinds as manure, and many cheap sources at present wasted are pointed out. The importance of securing better breeds of horses, mules, and cattle is also dealt with, from which it appears that the native farmer has not so far attempted selective breeding with the object of improving his stock.

The organization of central markets, the combination of farmers to construct roads, bridges, and other works benefiting the whole agricultural community, the formation of banks, the arrangement of local credit systems, supply of seed, and other matters are also fully dealt with, and in most cases instances of successful application of the methods recommended are given, so that there is every inducement for landowners and farmers to benefit by the wide experience which the Agricultural Department thus places at their service.

GENERAL NOTES.

SUGGESTIONS FOR THE PREVENTION OF MALARIA.

At the recent Malarial Conference held in Nagpur, an interesting paper was read by Captain G. T. Birdwood, comparing and summing up the methods, in use and suggested, for the prevention of malaria in India. He condemns the carrying out on a large scale of such expensive schemes as the quininising of the whole population, or the wholesale adoption of mosquito nets by the inhabitants; but advocates a thorough reform of sanitary matters, managed in such a way as not to run counter to native prejudices. He attributes the spread of malaria in many districts to the haphazard excavation of the earth; the holes thus formed become filled with stagnant water and a fruitful breeding place for the anopheles. Ponds are often dug to obtain earth for the repair of railway embankments and roads and for use in brickfields, and it is invariably noticed that in the presence of these the fever mortality of the locality is increased. To check this source of infection, he recommends that cantonment authorities should send a special health officer periodically to see that excavations of that nature are promptly filled in. A point that Captain Birdwood considers most important of all is the universal adoption of *pucca* surface drains in place of *kutcha* drains, the most frequent breeding places of anopheles mosquitoes in municipalities and cantonments being the accumulated water in *kutcha* surface drains and roadside ditches, and again it is important that municipal water schemes should adequately provide for carrying away the waste water from wells and hydrants. As well as the use by cantonment authorities of *pucca* masonry for canals, ditches, etc., owners of private gardens should be compelled to use it for their irrigation channels and drains.

He thinks the employment of bands of coolies for systematic cleansing purposes in Indian towns is not desirable, since there is always the danger of interfering with native domestic concerns and customs: although such mosquito brigades, as they are called, have proved successful in Sierra Leone, and other West African towns. Another source of trouble is the overcrowding of servants in the *kutcha* houses attached to European compounds, and a bye-law should be passed to deal with it. Although, as mentioned previously, the extensive use of gauze nets, etc. is deprecated, Captain Birdwood advocates the adoption of mosquito curtains in the soldiers' barracks throughout the infected districts, also the use of fumigating and bactericidal agents, such as sulphurous acid, in dealing with coolie sheds and workmen's quarters. It is now generally accepted that quinine is of no value when given in small doses, but highly valuable as a prophylactic agent in large quantities: he considers therefore that municipal authorities should encourage the use of quinine as suggested by Professor Koch (this JOURNAL February, 1902, p. 44). Finally the education of many of the advanced native scholars, on the subject of malaria, would go far to assist the carrying out of suggested schemes, such as improved sanitation, which is very much wanted, by teaching the people to associate the malarial fever with the presence of mosquitoes and stagnant pools of water, and their co-operation in schemes of sanitary and other reforms could then be expected.

HYDROGEN PEROXIDE AS A BLEACHING AGENT.

The bleaching of such organic substances as feathers, silk and ivory presents considerable difficulty, owing to the ease with which these materials are destroyed by the action of such agents as chlorine and sulphur dioxide commonly employed for this purpose. The latter has also the further disadvantage that it merely combines with the objectionable natural colouring matter to form unstable colourless compounds which are liable to decompose in the presence of moisture, giving off the malodorous sulphur dioxide and restoring the colour to the material. This is often observed in straw hats bleached by sulphur dioxide which, owing to the action of perspiration and the moisture of the atmosphere, slowly revert to the natural yellow colour of straw.

During the last few years hydrogen peroxide has been used to a considerable extent as a bleaching agent, for delicate organic materials of this class, and appears to answer this purpose well, since it has, practically, no action on these materials, whilst it destroys their colours. It is, however, somewhat more expensive than sulphur dioxide, and although many attempts have been made to cheapen its production, no marked success in this direction has yet been achieved. Mr. Fawsitt, F.R.S.E., in a paper read at a meeting of the Glasgow section of the Society of Chemical Industry, (Feb. 28, 1902) described a method which he has found to give good results in practice, and which consists in dissolving barium peroxide in ice-cold hydrochloric acid, the barium being subsequently removed by adding sufficient dilute sulphuric acid. The paper gives in addition details of the best methods of preserving hydrogen peroxide solution and of employing it for bleaching silk, wool, feathers, bone, ivory and straw, the processes described being those which have been found to answer well in actual practice. This chemical has also been recommended as an antiseptic, especially by the late Sir B. W. Richardson, but has not been much used in this way, owing apparently to the acid-impurities present in the solutions sold in commerce. Mr. Fawsitt has attempted to prepare solutions of hydrogen peroxide free from acids and other impurities by distillation and by purification with silver sulphate, but has so far only succeeded in slightly reducing the irritating character of these, but not in eliminating them entirely.

THE ACTION OF SUNLIGHT ON DYED LEATHERS.

A series of experiments was carried out at the Gardens of the Royal Botanical Society, Regent's Park, during 1900-1901, by Mr. C. Lamb, with the object of ascertaining the relative fastness to light of various coal-tar colours when applied to leather. The experiments were made by exposing about 1,500 specimens of dyed leather to direct sunlight until the dyes faded, the fading point being ascertained by comparison with similar specimens kept in the dark and with natural undyed samples of the same leather. A complete list of the dyes experimented with is published in the *Journal* of the Society of Chemical Industry (February 15, 1902), with their relative stabilities to light as established by these investigations, but it is possible to draw certain general conclusions regarding the behaviour of the principal groups of dyes, which may be given here.

It was observed that at first many colour changes occurred, thus several blue dyes such as turquoise and new patent blues became violet or green, whilst several greens changed to slate colour, and browns in some cases became blue, green or violet in shade.

At the end of 397 days the whole of the colours had faded, and only four, viz., violamine, nigrosine W. G., fast blue 5 R. and acid violet 5 R., survived after 322 days. The most fugitive colours were the eosines, curcumen S., erythrosine, methyl eosine, naphthol green B., phloxines B. T. and N., which had faded after only nine days' exposure. In general it was observed that basic dyes were less fugitive on leather than when applied to woollen goods. These experiments are now being extended to ascertain the effect of sunlight on leathers dyed with mixed dyestuffs, the influence of the acid in the dye bath on the stability of the dye, and the effect of the various "finishes" employed on the latter.

WEST INDIAN SWEET POTATOES.

Owing to the possibility of profitable cultivation of sweet potatoes, considerable attention has been given to the potato crop by the Imperial Department of Agriculture for the West Indies, and a great deal of experimental work has been carried on. Experiments were made in Antigua with a view to determining the best varieties for cultivation. Fifteen varieties were planted and the crop from each weighed; the yield varied from '6 to 4'4 tons, the varieties "Eliza," "T.1," and "T.2," giving the largest crops. A full report of these experiments will be found in the *Report on certain Economic Experiments in connection with the Botanic station, Antigua, 1900-1901*. In Barbados alone, starches, grains, and meals, which are food-stuffs similar in composition to sweet potatoes, are imported to the value of £95,000 per annum, so that if the potato crop could be preserved for consumption during the year, it could be used instead of this imported food. Sweet potatoes will not keep without some desiccating treatment in the West Indies, the conditions for their preservation being storage in dry air at about 50° to 60° Fahrenheit. In Japan they are preserved by cutting them into slices and drying the latter in the sun. Many tons of potato meal were made by Mr. Spooner, of Antigua, who prepared it by slicing the potatoes in a chaff-cutler, and drying the slices in the sun while spread out on wire netting, the drying being complete in about eight hours.

One ton of potatoes by this method yielded 910 lb. of meal, at a cost of about £4. 10s. 0d. per ton of meal.

Dr. Voelcker, who analysed the product, found it had the following composition:—

Moisture	11'99 per cent.
Nitrogenous matter	5'12 „ „
Oil	1'19 „ „
Sugar	9'90 „ „
Starch and carbohydrates	67'01 „ „
Woody fibre	1'89 „ „
Mineral matter	2'90 „ „

As regards the keeping qualities of the meal, some of it was stored in tins for twelve months, and was then found to be perfectly good.

A large portion of the sweet potato crop is at present used for making spirit, which is shipped to Portugal and used for fortifying wines.

USAR LANDS IN INDIA.

The question of the origin of *usar* lands in the North-West Provinces of India has occasioned considerable discussion, and several suggestions as to a means of utilizing these areas have been put forward. The *Pioneer* of Allahabad gives a brief outline of a theory advanced by Mr. John Cockburn, who proposes to convert them into vast lakes. He considers that *usar* patches are the silted-up beds of jhils (shallow lakes or marshes), and that the saline efflorescence known as *reh*, which is so poisonous to vegetation, is caused by the sun's rays. The sun draws through the bed of mineral clay the water which lies beneath, and has in solution certain saline constituents which are deposited on the surface as the solvent evaporates: this mineral matter forms a light powder (*reh*) with the top surface of the clay, which is swept off by the scorching west winds.

In this manner the top layer of clay is slowly being removed at the rate of about half-an-inch a year; after a few years a depression would be formed in which water will lodge, temporarily at first, but permanently when the depth became six to eight feet. In many cases beneath the *usar* plains there exists a supply of water, and the labour expended in converting these areas into lakes again, would be more profitable than the raising of *katcha* roads (the means now employed in affording famine relief). In tropical countries lakes are more valuable than the same area of cultivated land; therefore the wholesale reclamation of marshes is undesirable, and *usar* patches should be converted into sheets of water whenever possible. By breaking up the surface layer of impermeable clay and mixing it with organic matters, etc., *usar* areas may be converted into arable land; but at considerable expense, and if large quantities of manure are not frequently added the deterioration will be very rapid.

The *reh* is of considerable value as a source of caustic soda and sodium carbonate, also of common salt and nitre. There are over two million acres of this waste land in the North-West Provinces, a large proportion being covered with *reh* indicating a pent-up supply of water, and in course of time much of it might be reclaimed in the manner described above.

LECTURES AND PAPERS.

"THE COLOURED RACES IN AUSTRALIA."

(By The Hon. SIR HORACE TOZER, K.C.M.G.)

LORD LAMINGTON presided at a lecture given by SIR HORACE TOZER, Agent-General for Queensland, at the Institute, on the 10th February, entitled "The Coloured Races in Australia." In introducing the lecturer, the chairman remarked that Sir Horace had been instrumental in bringing forward, and passing, the Act which had given to Queensland aborigines a very large measure of protection.

Sir Horace said that, for the purpose of convenience, he would divide the coloured races in Australia into the following classes:—Aboriginal natives, South Sea Islanders (usually called Kanakas), Chinese, Japanese, Coolies or British Indians from India, Ceylon, or Afghanistan, and lastly, other aliens such as Malays, Philippine Islanders, and Syrians. Of these, the colour of the first two classes might be said to be "black," the third and fourth "yellow," and the remainder "brown."

Dealing first with the aborigines, an interesting account was given of their past and present condition, and of the various attempts that had been made to civilize them. They, however, had not proved themselves able to withstand the effects of indulgence in the vices of civilization, and their extinction was only a matter of time. The lecturer had never known a single case in which any aboriginal had permanently settled down to a white man's ordinary pursuits. Although he had met with many instances in which, by education, habits of refinement, kind influence, and good example, great efforts had been made to elevate these natives to a higher social, political, or business existence, this had all been of no avail. The steps adopted by the Queensland Legislature for their protection had been the reservation of 900 square miles of territory for their use and the appointment of two principal protectors to look after them, with the police as subsidiary protectors.

With regard to the South Sea Islands, in British New Guinea, which was about to be transferred to the Commonwealth, there were a large number of natives, but they had hitherto

not come to Australia in any large numbers. However, as they were agriculturists, it had been suggested that temporary use should be made of them—in the same manner as, in England, country labour was imported from towns for hop-picking, etc.—with arrangements for their return to their country after the particular tropical agriculture, which required their services, was over for the season. This scheme would, it was said, be a benefit to them as a civilizing influence, and enable the fertile coast-lands to produce all kinds of tropical produce. Sir Horace, however, was of opinion that this arrangement was at present outside the range of practical politics, and he had never been in favour of it.

The labour necessary for the cultivation of the sugar farms in Queensland had up to now been almost entirely drawn from the natives of the Solomon and New Hebrides Islands. In appearance there was not a very marked difference between these people, the Kanakas, and the aboriginal Australian. Their hair, however was curly, their stature lower, and they had a higher intelligence, and could be utilized in almost every kind of manual labour. Accustomed to out-door work in a tropical country, they made splendid agricultural labourers; in fact, in planting, hand-weeding, washing and cutting cane in North Queensland, they performed well such work as a white labourer could not permanently do, and which no white man ought ever to be asked to do. There were not 10,000 of them in the whole Continent, and their programme of labour was so limited and restricted by statute as to be practically confined to out-door work in purely tropical agriculture. As proof of the necessity of their labour for the sugar industry, it was stated that not 100 tons of sugar were produced annually in all Queensland in the manufacture of which a Kanaka had not some part. Sir Horace here spoke very warmly on the question of deporting these people out of Australia, and hoped that, at any rate, some provision would be made for, and protection given to them, when they reached their own country.

In point of time the Chinese were the first of the coloured races to emigrate to Australia, having commenced to arrive over fifty years ago. However, as there were not now more than 30,000 of them in the whole Continent, it could hardly be urged that they had swarmed over Australia. They all came from one province of China, but were, as a rule, of the lowest and most servile class. Yet they all appeared to be intelligent and had a certain amount of education. There was good reason for believing that the Chinese Government was adverse to their emigration, so that there was little cause to dread their over-running the country. Sir Horace commented upon the reasons advanced for the exclusion of the Chinese, and the steps taken to keep them out. Their numbers at the present time in Queensland were 8,783 males and 530 females.

There were but few Japanese in the State—only 2,115 males and 154 females. Some of these were indentured labourers, under contract to return home, and others were employed in the pearl industry. In fact, the Japanese were the only reliable divers, and if they were excluded the pearl industry would probably be in a bad way. At one time it appeared as if there was likely to be an invasion of Japanese labour, but of late years all fear of that had passed, and the Government of Japan had arranged with the Government of Queensland to so check the emigration as to supply only the Queensland demand. Sir Horace was of opinion that the new Anglo-Japanese Treaty would not in any way involve a change of policy with regard to the exclusion laws, which had recently been passed by the Commonwealth Parliament, for the purpose of excluding from Australia all coloured Asiatics, although in that category were included almost entirely the working classes of Japan.

The brown people might all be classed as Coolies. There were only 939 of them in Queensland, and an Indian invasion had never been threatened.

As a general rule it might be taken that the black races, including the Kanakas, did not blend with the whites, and that, therefore, their ease was on quite a different footing from that of the yellow races, which did. Sir Horace contended that the exclusion laws, which had been passed by the various colonies before Federation, had so arranged matters that the numbers of these coloured peoples had already decreased, and that those who remained neither blended with the Europeans to any appreciable extent, nor were ever likely to give rise to any problem so serious that it could not be easily dealt with by the various States when it arose. He then more fully described the recent legislation of the Federal Government with regard to a "White Australia," which he considered premature, as the question was not of such importance to the Commonwealth as those relating to either commerce or defence, which had not received their proper amount of attention. Also he considered that the aborigines had, so to speak, a first claim on the Commonwealth, and the recent colour legislation did not relate to them.

Sir Horace quite appreciated the necessity of Australia ultimately being a white country, but maintained that the coloured races were now extremely useful, commercially, and that the time had not yet arrived for excluding them altogether. He was also aware of the advantages to be derived from Commonwealth legislation on this matter, if only for the purpose of providing one system for the entire Continent.

He maintained that a good deal of the recent legislation had not so much reference to a White Australia as to labour questions, and in this connection he instanced the law which excluded British emigrants, among others, who had engaged, before leaving home, to take up work on their arrival, a measure which he deprecated; considering that, as Australia was badly in want of population, and that other attractive countries, not so expensive to reach, offered inducements to people to emigrate, they were not likely to go to Australia unless they were first satisfied that they would be welcomed there.

After the lecture Sir Horace Tozer exhibited a number of slides illustrating the habits of the various races with which he had been dealing, and also the various industries of the State, notably of cattle-raising.

Lord Lamington, after thanking Sir Horace for a most interesting lecture, doubted whether the Home Government had been so much to blame in the matter of Argentine meat supplies as was generally supposed. With regard to the Kanaka question, he felt that Queensland had been put in a difficult position in the matter by the Commonwealth Government, and that they all felt some regret that Queensland had not been more severe in making stipulations before joining the Federation.

"NEW ZEALAND: HER RECORD AND DESTINY."

(By EDWARD WAKEFIELD, Esq.)

In the unavoidable absence of Sir JAMES FERGUSSON, the chair was occupied by the Hon. W. PEMBER REEVES, Agent-General for New Zealand, at the lecture given by Mr. EDWARD WAKEFIELD at the Institute on Monday, 3rd March, entitled "New Zealand: her Record and Destiny," who, in his introductory remarks, said that those among the audience who were New Zealanders must be acquainted with Mr. Wakefield, who had lived for many years in the colony, and they could not have forgotten the able journalist, the well-known politician, and brilliant public speaker. Had the lecturer, however, been without these personal claims, he would be sure of a most attentive hearing, if only for the name he bore, which was one of the historical names of New Zealand. If any man could claim to be the founder of the colony it was Edward Gibbon Wakefield, to whom was due the hoisting of the British Flag there 62 years ago. Very few people, at that time, had any faith in the colony. The rulers of the Empire did not think it would be at all a desirable addition to their responsibilities, and anyone who had prophesied that the time would come when New Zealanders would shed their blood for the old country in South Africa, would probably have been considered a madman. Edward Gibbon Wakefield could hardly have foreseen that, but he had foresight enough to know that in New Zealand Great Britain would acquire a splendid colony.

The lecturer said that New Zealand was a country combining the characteristics of almost all the best of the civilized parts of the world. The colony was often spoken of as the antipodes of Great Britain, but this was not correct. Its geographical position corresponded more nearly to that of Italy and Turkey. However, both the country and the people had so many characteristics in common with Great Britain, that the description of the colony as the Great Britain of the South had a good deal of justification for it.

The greater part of the lecture was historical, and Mr. Wakefield reminded his audience that the first intimation that Europeans had of the existence of such a country as New Zealand was its accidental discovery by Tasman in 1642. That explorer had given it its present name, a most inappropriate one, for it was in very many respects most unlike Zealand. The colony in fact was one of the most mountainous districts in the world, and, but for its maritime position, would bear a strong resemblance to Switzerland.

Owing to Europe having been so occupied with its wars and revolutions nothing more was heard of New Zealand for 122 years, when Captain Cook visited it. But he had been a navigator and not a colonist, and the idea of founding a settlement in the country apparently never occurred to him.

After Captain Cook many other captains touched on the shores of New Zealand, or discovered the islands round it, bringing away with them curiosities, native weapons, and tales of bloodshed and terror. Thus the country began to be surrounded with an atmosphere of mystery and romance, which excited the interest of the missionaries, who were the first civilized people to make a landing.

Mr. Wakefield described how narrowly the country escaped becoming first a Dutch and then a French colony, and stated that even the hoisting of the British Flag by Colonel Wakefield in 1840 had, at the time, been almost considered an exploit of piracy. However, the Duke of Wellington had upheld the action, and it was after him that the capital of the colony took its name.

The ideal of New Zealand's founders had been to make the colony as nearly as possible like Great Britain, politically and socially, while enjoying all the advantages of a virgin soil and perfect climate. Of the early founders Edward Gibbon Wakefield was the most important. He, in 1840, formed the New Zealand Company, and brought over 1,200 settlers who established themselves in what was now the city of Wellington.

Other settlements from time to time sprang up in different parts of the country, with more or less independent forms of government. However, when the troubles with the natives—mainly over questions of land tenure—became acute, and Auckland was turned into a great military camp, the Government changed its form and became much more centralised.

A vivid account was here given of the tribal wars of the Maoris and of the consequent wholesale slaughter, mainly due to their use of firearms, which had been the real cause of the decimation of the native races.

The war between the English and Maoris lasted, with longer or shorter intervals, from 1843 to 1869, when it suddenly came to an end. The Maoris had proved themselves to be among the best of soldiers; perhaps, behind palisades, the best. Their recent offer of service in South Africa had shown that the war had left no lasting ill effects behind it.

New Zealand was the only part of Australasia which had passed through the fire of a severe and prolonged military conflict as a condition of its existence, and in that conflict would be found one of the main causes which distinguished it so sharply from Australia.

These wars, and the consequent subsidence of the small Provincial Governments, changed the whole state of affairs in New Zealand. Up to 1869 the public works had been locally administered by the Provincial Governments, but in 1870, at the conclusion of the war, the Public Works Policy had been adopted, by which it had been decided to borrow £10,000,000 on the security of the colony, the whole to be spent in ten years on public works, immigration, and especially on railways. The results were remarkable. The whole colony entered upon a career of activity and commercial excitement. Mr. Wakefield here paid a high tribute to Sir Julius Vogel, and explained how this policy had been marred by events over which New Zealand had no control—notably by the failure of the Glasgow Bank—which had caused a demand for the withdrawal of much of the borrowed money.

An interesting description was given as to how Sir George Grey had suddenly returned to active political life, of the share he had then taken in the affairs of the colony, and of how, as legatee of that statesman's influence, Mr. Seddon had come to occupy his present position. Mr. Wakefield thought that perhaps the word "Socialism," so often applied to the legislation of New Zealand, was not an appropriate one; although wealth there was more evenly distributed than in any other country in the world, there was practically no poverty, and one could not find a man with a patch on his coat from one end of the colony to the other.

Some quotations were made from the New Zealand Year-Book to show the present prosperous condition of the country, and Mr. Wakefield considered that, with its wonderful productiveness and buoyancy, it would at no very distant date fulfil all that its most ardent enthusiasts had hoped. The country was at present simply in a state of incubation, and developments were preparing which would, in time, give new impulses upon an enormous scale. He believed that the war in South Africa had done New Zealand a great deal of good, having brought out the spirit of the people, widened their ideas, and given them Imperialistic ideals to an extraordinary extent. The future of the colony was, he contended, to be that of Queen of the Pacific. It was a purely maritime country, 1,200 miles from the nearest mainland, and surrounded by islands of great wealth and capabilities. He believed that Lord Ranfurly and Mr. Seddon were perfectly right, and were looking wisely ahead, in gradually and persistently making New Zealand the ruler of all these islands. The country had, with its unparalleled water power and land-locked harbours, a future for electricity which no other country in the world possessed, and he looked forward to seeing, in the West Coast Sounds, cities like Glasgow and Belfast which would send out their 20,000-ton steamers to successfully contend against the competition of any foreign country.

Sir James Fergusson, who arrived during the lecture, said that as a previous Governor of New Zealand, it had given him much pleasure to hear what Mr. Wakefield had had to say about the colony. He then gave some interesting anecdotes of Maori chivalry, and said he must refer to something Mr. Wakefield had said as to the warlike feeling that had been developed towards the mother-country and the Empire of which New Zealand formed so honourable a part. Something better than warlike feeling—brotherly feeling—had been developed. By their gallantry, though unfortunately they had suffered, the New Zealanders had quite recently contributed to a brilliant victory. He had been Governor of the colony twenty-six years ago, and had visited it again six years ago, when he had been much struck with the great advance that had been made in the meantime, not only from a material point of view, but more particularly with regard to the people themselves. Education, which was universal in the country, had already left its mark upon the people.

"THE COMMERCIAL PRODUCTS AND AGRICULTURAL RESOURCES OF THE CROWN COLONIES."

(By Mr. HEDGER WALLACE.)

A course of lectures recently delivered by Mr. HEDGER WALLACE at the Imperial Institute on "The Commercial Products and Agricultural Resources of the Crown Colonies" was designed, through the demonstrations, following each lecture, which he gave in the galleries of the Institute, to attract attention to the collections of products illustrative of the

resources of the various colonies which are there displayed. Mr. Wallace pointed out that the subject of the course merited examination and attention, as we inhabited an Empire and not an island, and it was, therefore, to our interest to become well acquainted with Britain-beyond-the-Seas.

The imports of Great Britain last year were stated to have exceeded the exports by about £240,000,000. It was contended that, so long as this adverse balance remained within the Empire there was not so much cause for complaint; but actually such was not the case, and the question, therefore, of where it went to was of importance, especially as most foreign nations were now deliberately trying to make themselves self-supporting and independent of one another and of the British Empire.

Under the circumstances we ought, therefore, to do two things: (1) study and understand the capacity of our own colonies and possessions; and (2) seek to open up new markets both inside and outside the Empire. In this connection we had much to learn from Germany. For instance, the German Colonial Society's Intelligence Bureau, now supported by the State, attempted to give the fullest information to would-be emigrants, and thus to attract emigration to their own colonies, in order that the German Empire might benefit thereby to the greatest possible extent. To further assist in the development of her colonies, Germany was frequently sending scientific experts to examine and report as to how such countries could be turned to the best account, the result being that, when the German Government had obtained this information, it was prepared to expend capital to develop ascertained resources, and to attract private investors.

Mr. Wallace stated that in our Crown Colonies and Protectorates little had as yet been done by the Government to ascertain and develop their resources, and he instanced the Report of Sir Charles Eliot on the East African Protectorate, in which application had been made to the Home Government for experts to make investigations, in order to find out what timber the country contained, what kind of indiarubber the natives gathered, what species of plant produced it, and what commercial tropical plants could be profitably grown. The Treasury, in response to this application, sent only one expert, and that a geologist. All the experts asked for would, Mr. Hedger Wallace contended, have been sent by Germany had the colony been a German possession. In sending a geologist, Mr. Wallace pointed out that the Government were following the precedent of the self-governing colonies, where the mineral resources were regarded as the chief attraction, and where it was generally considered that, if the mining industries were primarily assisted, the subsidiary agricultural resources would, as a matter of course, develop themselves without any such help. The agricultural development of a tropical country like the East African Protectorate could, however, be undertaken more quickly, more extensively, and more profitably than that of the mineral resources; for the metallic ores and coalfields of a district were usually more sparsely distributed than the land capable of cultivation, and were at first too expensive to work, in the absence of railways and good and cheap transit.

The British Colonies and Dependencies altogether occupied an area of about 11,600,000 square miles, but the area of island-groups of the Crown Colonies—the subject of his lectures—was only 245,000 square miles. These island-colonies differed in their forms of Government; some were entirely controlled by the Home Government; others possessed representative institutions, and the Crown had merely a vote on legislation and the control of public officers; others again were dependencies, subordinate, either to a colony with representative institutions, or to one with responsible Government, and administered by functionaries of that Government. Some were internally independent but subject to British control, and the Government of others was in the hands of chartered companies.

With a few exceptions, all the island-groups of the Crown Colonies were situated between the two tropics, and had been developed by daring and ambitious men who were either adventurous traders or cultivators. In these colonies, however, what were termed the subject-races predominated, although some of them could be regarded as self-governing politically, but this was through the small white population they contained.

These insular Crown Colonies could be divided into (1) continental islands, which were either, like Borneo, detached fragments from the adjacent continent, and separated from it by submerged or shallow banks, and where the fauna resembled that of the mainland; or, like the Madagascar group, ancient continental islands, now divided off by deep sea and with a more or less distinct fauna; and (2) oceanic islands, of either coral or volcanic formation, far away from a continent and surrounded by deep sea. Bermuda was an example of such a coral island, and St. Helena of a volcanic one, while in the Pacific group are to be found many examples of coral atolls.

Conclusions with regard to climate, etc., arrived at from the consideration of geographical position alone, were however generally erroneous, although, from a study of the flora of an area, a botanist could usually form some idea of the climatic conditions prevalent in that area.

Practically all the island-groups of the Crown Colonies were situated in three generally recognised belts. The first, the equatorial, or great evergreen forest region, extended from 12 degrees or 15 degrees on either side of the equator, and had the highest mean temperature and the heaviest rainfall, there being two areas in this belt, one with a perpetual rainfall and another with two seasons of intermittent rain. In this hot, damp climate, with little change of season, flowers bloomed throughout the entire year and fruits followed in quick succession. The second belt, the tropical or great jungle- and bush-region, extended from 15 degrees to 25 degrees north and south of the equator, and had a single rainy season, there being one long period of rain followed by another period of continuous dry weather. An interesting point was that, as a rule, the further from the equator a colony, in this belt, was situated, the greater was the day temperature, being in some cases even higher than that of places in the equatorial belt. The night temperature was, however, proportionately lower. The third, or sub-tropical, belt extended from 25 degrees to 34 degrees north and south of the equator, with a temperature ranging from 72 to 64 degrees. Very few of the island-groups of Crown Colonies were situated in this belt.

One fact to be remembered with regard to the climates of the various colonies within the tropics was that there was very little variation in their mean annual temperature. Those of Kingston, Jamaica, Zanzibar, and Bua, Fiji, for example, did not vary two degrees throughout the year.

Again, when a colony ran east and west, its isothermal lines did not usually vary, and its produce would be practically the same throughout its whole area; but, when a country ran north and south, with parts perhaps in the warm temperate and parts in the equatorial belts, the products differed accordingly and the conditions of life and labour in the island would be very varied.

In estimating the suitability of a colony for varied agricultural purposes, the most important factors to be taken into consideration, besides the soil and the climate, were good government, abundant suitable and cheap labour, and regular markets, easy of access and capable of expansion. Good government gave security, attracted capital and ensured steadiness to labour. In our Crown Colonies, Mr. Hedger Wallace stated that the officials were, perhaps, so over-anxious not to be unjust to foreign traders that an Englishman sometimes got no advantage from being under his own flag. The action of the French official (as in Madagascar and Algiers), was, in this respect, very different; in these countries the interests of the foreigner were always regarded as secondary. In many of the Crown Colonies the labour question was acute. Climate affected the manager or director of labour, who represented capital and intelligence, both in respect to health and energy, and, as a rule, quick returns and yields were looked for in a colony within the tropics. The requisite

manual labour, in many cases, could often be obtained from the indigenous races, but the conditions of life were often so easy that the native could satisfy his wants with working but very short time. Formerly, when he felt hungry he went on the war-path and plundered, and now, when necessity made him willing to work, he was often not anxious to do so for as long as his employer would be willing to pay him. This, again, opened up the vexed question of imported labour.

Mr. Hedger Wallace dealt fully with many other interesting points, and described at length the resources of the various colonies included under the term island-groups of the Crown Colonies, while, in the galleries of the Institute, after each lecture, he pointed out the leading products of each colony, explaining how they were grown or obtained, and the purposes to which they were commercially put.

"RUSSIA AND THE RUSSIANS."

(By MR. ALEXANDER KINLOCH.)

(ANGLO-RUSSIAN LITERARY SOCIETY.)

At the monthly meeting of this Society, Colonel Lambert in the chair, a lecture on "Russia and the Russians" was delivered on April 1, by Mr. Alexander Kinloch, hon. secretary, who remarked that, whilst Russia and England are the two largest and the two greatest Empires in the world, they each possess to a remarkable degree what the other lacks. For which reason, seeing that the two nations are slowly but surely drifting with their frontiers into a contiguous line of proximity in Asia, it is eminently desirable that a wider and sounder commercial intercourse than heretofore should be established between them.

Mr. Kinloch gave a rapid sketch of the origin and the racial characteristics of the Russians from the period of the Slav migration into Europe, of the introduction of Christianity, the Tartar invasion, the struggle for supremacy with Poland, the transformation of Russia from an Asiatic into a European nation by the far-seeing policy of Peter the Great, the emancipation of the serfs; and concluded with a general survey of the present social, political and religious condition of the people. According to the lecturer, the progress of Russia, in general civilization, in art, commerce and education has been greater during the last 40 years than in the whole of the preceding two centuries (see *Russia, its Industries and Trade*, Glasgow International Exhibition, 1901). The lecturer dwelt in particular on the home-rule aspect of the *Mir*, the Village Commune, in which woman as head of a household, has a vote on a par with men.

The national institution of public baths, the weekly use of which is religiously observed by every Russian, was a contradiction of the foreign opinion that the Russians were a dirty people. The strong religious sentiment of orthodox unity and the almost fanatical loyalty to *batushka*, the tsar, so deeply rooted in the peasantry, will always serve in the opinion of the lecturer as a powerful deterrent to the spread of any serious revolutionary movement in Russia.

The lecture was illustrated by admirable lime-light views especially prepared and presented by the Kodak Co.'s agent at Moscow, and by Capt. Daunt, I.C.S. Among the former were new and hitherto unpublished portraits of Tolstoi and Gorki.

In the absence of the president the hon. secretary, before beginning his lecture, commented in sympathetic terms on the painful loss the Society had sustained in the death, on 29th March, of Sir Sidney Shippard, a highly esteemed member of its committee.

PROCEEDINGS OF INSTITUTIONS.

ROYAL AGRICULTURAL SOCIETY OF ENGLAND.

The usual monthly meeting of the Council was held on the 9th ult., PRINCE CHRISTIAN (president) in the chair. The Earl of Radnor was elected a governor of the Society, and 30 new members were elected. Mr. Bowen-Jones, in presenting the report of the Chemical and Woburn Committee, said that the British Oil and Cake Mills (Limited), an organization comprising and controlling about one-half of the principal firms of cake manufacturers in different parts of the country, had now decided that, so far as the branches under their control were concerned, they would give up the use of the "95 per cent." guarantee, and conform to the recommendations given by the Royal Agricultural Society of England, which were to the effect that linseed cake should be sold as "pure and in good condition."

The Hon. C. T. Parker presented a report made to the Veterinary Committee by Professor McFadyean, which stated that during the last four weeks for which returns had been issued there had been 55 outbreaks of anthrax with 113 animals attacked, as against 52 and 59 respectively for the corresponding period of last year. The number of outbreaks of glanders for the same four weeks was 95, and the number of animals attacked 169, as against 97 outbreaks and 145 animals attacked last year. Four cases of rabies, all in dogs, had been notified during the last four weeks in the counties of Pembroke and Cardigan, making a total of seven since the beginning of the year. The recent returns indicated a considerable decline in the prevalence of swine fever; the total number of outbreaks reported during the last four weeks was 109, as against 286 in the same period of last year. It was greatly to be regretted that foot-and-mouth disease had again appeared, an outbreak having been discovered near Canterbury in the last week in March.

Mr. Sanday reported from the Implement Committee that 10,702 feet of total shedding had been allotted in 338 stands in the implement department of the society's forthcoming meeting at Carlisle from July 5 to 7 next, and that the entries of new implements numbered 53.

Lord Moreton reported from the Education Committee that a total of 69 entries had been received for the examination for the national diploma in agriculture to be held jointly by the Royal Agricultural Society of England and the Highland and Agricultural Society of Scotland at the Yorkshire College, Leeds, from May 5 to 8 next.

Mr. Crutchley said that there was every reason to hope that the show of 1903 would be held on the new permanent site at the usual time—namely, the week after Ascot.

Other business having been transacted, the Council adjourned until Wednesday, May 7 next.

THE LONDON CHAMBER OF COMMERCE.

The monthly dinner of the London Chamber of Commerce held on the 9th ult., was followed by a discussion on West Africa. SIR GEORGE TAUBMAN GOLDIE presided and, in opening the discussion, said that 20 years ago our West African territories consisted only of two or three scattered strips of coast line, but to-day we possessed a West African Empire, covering an area many times as large as the British Isles. With regard to internal settlement, a good deal remained to be done, but the completion of the work was only a question of time, because it was no longer imperilled by foreign interference or foreign intrigue. Political supporters and opponents of Mr. Chamberlain must alike admire the vitality and vigour which he had imported into West African affairs since he took office in 1895. Nor would this benefit altogether cease with Mr. Chamberlain's tenure of office, for we might feel sure that the seals of the Colonial Office would never again be entrusted to any but the most able Ministers of the Crown. Dealing with the labour question, he said he believed that in the Hausa race there was a reservoir of labour which would not only supply all the require-

ments of their own country, but overflow, in the first instance, into the Gold Coast and the neighbouring regions, and afterwards into our possessions south of the Zambesi. Pending the establishment of a real emigration scheme from Hausaland, he thought that, in order to meet any shortage of labour in the Gold Coast, temporary recourse would have to be had to the Chinese. There were many objections to such a policy, and no doubt it would be desirable to make arrangements for sending the Chinese back to their own country when native labour became available. He felt confident that, in the not distant future, West Africa would be one of the most flourishing possessions of the British Crown.

Lord Duncannon referred to the failure of those interested in the mining industry to found a West African Chamber of Mines, and said that it was now proposed to start a mining section of the West African department of the London Chamber of Commerce.

Sir Harry Johnston remarked that in West Africa, as in East Africa and South Africa, he should like to see our policy tending towards something like unification of administration. Let there be but one Budget for the whole of West Africa, instead of one colony being anxious to swell its little revenue without any concern for neighbouring colonies or protectorates. He thought that we were much behind Germany and France in respect of the scientific examination of the territories under our control. This was an important matter, but the attitude of the Foreign Office was utterly unsympathetic with regard to it. He believed that, if a few thousand pounds had been spent on the scientific examination of Uganda, the railway would have been constructed for £750,000 less than it cost. There were many parts of tropical Africa under our sway which were not likely at any time to be suitable for residence by white people, but they might contribute indirectly to the prosperity of this country if well and wisely governed. At any rate, our object should be to prevent these possessions from remaining a financial burden to the taxpayers of Great Britain. He was in favour of the natives paying a small hut-tax. The native should have full rights, and endeavour to justify his claim to them by bearing his proper share of the cost of governing the country. If the people were afforded the opportunity of earning wages he believed no objection would be made to any such small tax.

THE ROYAL UNITED SERVICE INSTITUTION.

At a meeting of the Institution, held on the 10th ult., SIR JOHN COLOMB, M.P., submitted for discussion two papers on the subject of "The Garrisoning of our Coaling Stations." LORD HAMPDEN presided.

Sir John Colomb stated his reasons for thinking that we had exaggerated risk and had overdone the fortifications of coaling stations, and consequently garrisons, and said that he did not accept the War Office standard of the numerical strength of the garrison establishments as a guide for the Admiralty in the event of their taking over any of these bases. He submitted that on any distant naval station the outbreak of war should not find our admiral without force at his disposal and available for general service afloat or ashore, exclusive of the complement of his ship. As to what was to be done with the supernumerary force in peace, he said it should obviously be at the base, and if there, he asked why should not the nucleus of the reserve force for war form the peace garrison. Whatever might be the peace arrangement it was certain that in war a force of some sort would be required in the future, as in the past, for minor operations at ports and on coasts. The release of the peace garrisons for general service was a question of reserves trained and adapted to take their place promptly on the outbreak of war. His view was that we could look to the colonies for producing such a force in war, which should be kept in reserve in peace. He advocated the garrisoning of two naval bases in the other hemisphere as a step in the development of a policy of embracing colonial auxiliary reserves for general service in war under the admirals; and he urged that within certain limits the garrisoning of distant bases with marine forces would not be detrimental to the efficiency of the fleet and would not deteriorate the marines. He pointed out that, as compared with the executive branch, the marine branch had declined by 14·1 per cent. between 1858 and 1900, so that in a year of mastless armoured vessels there were, roughly speaking, 5,000 fewer marines than, according to the 1858 standard, was considered the proper proportion in days of rigged ships. He was in favour of restoring the old ratio, and said that an addition of 5,000 marines to the present force for garrisoning work could be justly and fairly held to be a moderate and reasonable proposition. By combining the question of naval garrisons with that of colonial naval reserves, a beginning might be made with the definite object of providing for the immediate and pressing requirements of the China station in the event of war. Probably the view taken by the colonial Governments concerned would be more influenced by the precise nature of the proposition than by the abstract principle of its justice. The proposition might take the form of a compromise over the colonial naval reserve question.

In short, Australia and Canada should jointly undertake to provide a naval auxiliary reserve force for general service in war, the numerical strength of which should be determined by reference to the immediate requirements of the China station on the outbreak of war. The cost to the colonies would be insignificant; the object would be definite. He was apprehensive of an outbreak of maritime war overtaking us and finding our admirals on distant stations without any force but the complements of their ships to carry out coast operations incidental to, and inevitable in, maritime war. It was a policy which he was convinced was fraught with peril. On the other hand, there was an evident, if somewhat theoretical, desire on the part of the colonies to create naval reserves, but a disinclination to accept conditions as to pay, training, service afloat, etc., which unless imposed and accepted would not produce really effective and efficient results. This course, suggested as a definite policy, would fill the gap in our arrangements which any comprehensive view of the situation on the outbreak of war disclosed; and it offered a practical mode for embracing colonial aid for the prosecution of operations incidental to maritime war. The lecturer discussed the questions raised in his memorandum at considerable length, and dealt with various objections to the proposal to substitute marine for army garrisons and to transfer their control and custody from the War Office to the Admiralty. In conclusion, he said that these were some of the purely naval aspects of the question. It appeared to him that our commercial and economic position—wholly dependent as it was upon sea security—was now such that it could not endure prolonged abnormal strain. The prompt and decisive assertion of naval power, on the outbreak of war, seemed to him to be the essential paramount condition of our economic survival. He felt more concerned, therefore, in arrangements to enable our admirals to deal quickly and effectively in their several stations with the ships of the enemy, wherever found, than in army corps to sit down and wait behind hedges in Sussex or in hop-gardens in Kent, on the "off chance" of being some use when the British economic position was in ruins because our naval means had been found insufficient and the organization of our naval stations had been proved by war to be incomplete.

In the discussion which took place, Colonel R. H. Veitch said that he had had the question of the land defence of our naval bases under his notice for some years in positions of responsibility. The manner in which Wei-hai-wei had been dealt with, he admitted, was somewhat perplexing, but it was a matter of detail and not of principle. The question raised by the lecturer was, on the other hand, one of principle. The Navy was our first line of defence, and it was the duty of the second line—the Army—to enable the Navy to carry on its operations efficiently and to protect the naval bases. The Navy was none too strong for them to trifle with it in the way urged by Sir John Colomb. If the control of the naval ports were handed over to the Admiralty, there was danger that the Admiralty would think of the ships first, and the ports last.

Rear-Admiral W.H. Henderson considered that the memorandum and the letter were of an extremely high order, and he was in general agreement with the principle which they contained. With regard to the marines, the reason why many of them left was because when they had finished a period of service there was no further outlook for them. This was a matter which they should keep in view. The question raised by Sir John Colomb was one of Imperial policy. Our Imperial policy of defence was in a state of chaos; we were unorganized, and until we got a Council of Imperial Defence that would lead the way and give us light he thought that we stood a chance of failing if we were pitted against other nations. It was necessary for us now to follow the natural law of central control. At the present time there was no control over the Admiralty and the War Office in this matter of Imperial policy; they did their very best with the highest motives, but naturally and instinctively they must fight and work for their own hands. Until some central control was established no scheme such as Sir John Colomb had brought forward had the slightest chance of standing. Our main defect was want of organization. He hoped that at the conference of colonial Premiers when they came over for the Coronation some steps would be taken to put our Imperial policy of defence upon a higher plane with higher organization.

THE ROYAL STATISTICAL SOCIETY.

A meeting of the Society was held on the 15th ult., when a paper on "Factory legislation considered with reference to the wages, etc., of the operatives protected thereby," was read by Mr. GEORGE H. WOOD. LORD AVEBURY, the president, was in the chair. After reviewing the factory legislation of the past century, Mr. Wood dealt with the effects of legislation on women's wages. He said that until the Act of 1847 the legal reduction of hours of labour did not reduce women's wages, but was generally followed by an increase. The Act of 1847, which reduced the hours in the textile trades, was passed during a very severe trade depression, the influence of which vitiated comparisons, but the evidence showed that the reduction in hours reduced earnings for a time but not proportionately, and, further, that the loss was recovered in a few years. This was due to the beneficial effects of the Act on the workers. In the case of the extension to bleaching a similar feature presented itself. Wages fell in 1861, the year after the passing of the Act, but two years later they had risen to a higher level than before. There was a general rise of women's wages after 1860 until 1874-77. The Act of 1874 again reduced the hours in the textile trades, and ultimately wages rose to a higher point than at the period before the passing of the Act. He illustrated by means of index numbers the changes in the levels of women's wages. When the changes in the general average of women's wages in 16 industries were compared with changes in the average of a large group of industries employing both sexes, it was found that women's wages had risen faster and more regularly than the average of all. A table setting forth the changes in the proportionate numbers of men, women, young persons, and children employed, at various periods in the chief textile industries showed a great reduction in the employment of children, a displacement of women by men in the worsted trades, and, except in the cotton and wool trades, a tendency to increase in the proportionate numbers of men employed. Factory legislation had not, on the whole, resulted in the displacement of "protected" by "unprotected" workers. Neither had the extension of the Factory Acts adversely affected the foreign trade; while, on the other hand, it was submitted that the whole community had benefited either directly or indirectly. In view of those facts, the author argued that further extension to include the "sweated" industries was desirable. In the discussion which followed the chairman remarked that it was curious that the attention of Parliament and the Government should be so much attracted to the factory class of the community, while the class of shop assistants was rather neglected.

COMMERCIAL INTELLIGENCE DEPARTMENT.

CORRESPONDENCE AND ENQUIRIES.

The following are given as specimens of some of the enquiries which have been addressed to, and satisfactorily answered by, the Institute during the past month (April).

*** All communications must be authenticated by the name and address of the writer. Enquiries which would involve special applications or expense will be a matter of arrangement with the correspondent.*

- C. S. C. & Co., London.—Production and use of margosa oil.
- O. H. & Co., Leeds.—Silk dyeing.
- E. A. Q., Oxon.—Makers of fish hooks.
- G. E. C. & Co., London.—Ferro compounds.
- S. P. & Co., London.—Shippers of timber from North Borneo.
- Verbal.—Climate, etc. of Northern Nigeria.
- " Dika-fat from West Africa.
- " Climate and cost of living in Hong Kong.
- " General prospects in New Zealand.

REQUIREMENTS REGISTRY.

In order to provide correspondents with an opportunity of making known special "wants" or "needs" in the British Colonies, India, and Foreign Countries, space will be regularly devoted to the publication of approved notices in the IMPERIAL INSTITUTE JOURNAL. Notices, as a rule, should not exceed 25 words in length, for which a charge of 2s. 6d. will be made for each insertion. Special arrangements can be made for longer notices.

SPECIMENS OF FOREIGN AND COLONIAL WOODS desired. Purchase or exchange. Names and localities must be well authenticated. Address—HERBERT STONE, BRACEBRIDGE-STREET, BIRMINGHAM.

THE CURATOR OF THE CANADIAN SECTION OF THE IMPERIAL INSTITUTE is prepared to furnish information about Canadian Trade and to supply names of importers, manufacturers, shippers, etc.

The following trade enquiries have been received at the Canadian Section of the Imperial Institute, from the Curator of which Section further particulars may be obtained:—

- Home Enquiries.**—A manufacturer of various kinds of deed and cash boxes is prepared to appoint a responsible Canadian resident agent to introduce these goods.
- A firm claiming a good connection with the trade in all parts of the United Kingdom, wish to secure a first-class Canadian agency in white mouldings for pictures, hardwood mouldings, mouldings for mantels, etc.
- A manufacturer of vulcanite pens and other goods seeks a capable Canadian resident agent.
- A Lancashire firm ask to be furnished with the addresses of the leading Canadian manufacturers of bedroom suites, tables, chairs, desks, and other furniture.
- A manufacturer of writing inks seeks responsible Canadian resident agent.
- An Irish firm desire names of principal Canadian manufacturers of bacon, etc.
- A company manufacturing chemists' specialities and flavouring essences, etc., seek responsible Canadian agents.
- A Liverpool firm ask to be placed in correspondence with Canadian makers of wood clog soles.
- A London firm dealing in macaroni, vermicelli, peels, and essential oils, would like to hear from Canadian importers of these articles.
- Canadian Enquiries.**—A Canadian company about to undertake the production on a large scale of dowels, skewers, window shade rollers, and other descriptions of wood-working

goods, are sending a representative over who would be pleased to hear from importers of this class of goods.

A Toronto firm of manufacturers' agents wish to be placed in communication with the United Kingdom manufacturers of stationery articles, Christmas cards, and similar goods.

A Canadian firm manufacturing maple skewers wish to get into communication with British importers of same.

A Montreal house whose travellers cover Eastern Canada, wish to hear from United Kingdom manufacturers of grocers' specialties, novelties, and stationery goods, seeking representation in Canada.

A Canadian company packing bacon and other pork and beef products invite correspondence from importers.

Foreign Enquiry.—A firm in Hamburg wish to be supplied with the names of Canadian exporters of pigs' heads in pickle, feet in salt, and various kinds of bacon.

MAPS AND CHARTS.—RECORDS.

[The entire collection of maps (with the exception of a few atlases and maps issued by private firms) consists of authoritative publications of the various government cartographical departments. Such as: the One-inch Ordnance Survey of Great Britain and Ireland, a complete set of Admiralty Charts, and a selection from the maps compiled in the Intelligence Division of the War Office; the monumental "Indian Atlas," and a large number of the publications of the Surveyor-General's Office, Calcutta; the Geological Survey of Canada, and the Government Surveys of Victoria and New South Wales. In the arrangement of the collection, the geographical classification of the War Office Intelligence Department catalogue has, with some modifications, been followed.]

358 Japan:—West coast of Kiusiu and Nipon.

1055 Australia, west coast:—Bedout island to Cape Cuvier.

2731 Australia, south coast:—Geelong harbour.

16702 Australia, east coast:—Moreton bay, sheet 1.

2766 New Guinea, north-east coast.

979 Pacific islands between 160 E. and 150 W. longitude:—Plan of Maua-hiki on this sheet.

THE SUGAR BOUNTIES.

At a recent meeting of the British Chamber of Commerce in Paris, Mr. H. Millington-Drake read an interesting paper on the "Rise and Fall of the Sugar Bounties." In the course of his remarks he said that, possibly, the simplest definition of a bounty is "Money taken from the mass of the taxpayers and handed over to a small number of individuals or societies who have had eloquence or interest enough to persuade the Government that they should have it." For several years past in France, for every bag of sugar (of 100 kilos.) exported the maker has received on an average about 10 fcs., which has had to come from the pocket of the taxpayer, with the consequence that the consumer here pays dearer for his sugar than in any other country in the world. In France the tax on sugar is 64 fcs. per 100 kilos., or over 200 per cent., and as Mr. Yves Guyot has said: "Si le consommateur français ne se révolte pas contre la surcharge qui le frappe, c'est parce qu'il ne s'en rend pas compte." Between 1884-1900 the sum of 764,000,000 fcs. has been paid to French manufacturers, which it has been estimated represents over 100 per cent. more than the value of the factories themselves.

The history of bounties would take us back to 1648, but as at that time they only concerned cane sugar they may be ignored for the present. It was not until 1747 that a German chemist discovered that many roots contained sugar, especially the beet-root. A factory was started in 1801 to exploit this discovery near Breslau, and shortly afterwards two factories were established in France, but the expenses of extraction were great and they met with little success as a commercial venture. The English blockade of European ports in 1810 which prevented West Indian sugar entering France, caused Napoleon to turn his attention to beet-roots, hoping to raise sufficient to meet the needs of sugar consumption in France, and in 1812 the French Government placed at the disposition of the Minister of Agriculture

100,000 arpents de terre (about 100,000 acres) 1,000,000 fcs. and exemption from all taxes, which may be said to be the beginning of bounties. The beginning was slow, and general peace caused a heavy decline in prices. In 1829 France contained 100 factories producing only 5,000 tons of sugar,—about a fortnight's production for a single big factory to-day. At this time France was going ahead of Germany, neither country receiving any bounties. In 1836 France had 436 factories making 49,000 tons of sugar, at which time a consumption duty of 15 fcs. per 100 kilos. was put on with disastrous consequences, no less than 166 factories coming to grief. This is somewhat remarkable in view of the fact that the duty is now 64 fcs. instead of 15 fcs.

Coming to more recent times we may fix the date of the bounty war as having its origin about 1871, after the Franco-Prussian war, when Germany began to make real industrial progress. In 1870 France manufactured 290,000 tons of sugar against Germany 186,000 tons. To-day Germany produces 2,300,000 tons against 1,150,000 tons made in France. What brought about this marvellous result in Germany? Most people will reply, "Bounties," but this is only partially true. A bounty on production existed in 1870, and the intention of the German Government was to diminish it until it was completely extinguished; she showed her good faith by reducing it, as we shall see later.

The real reasons of the remarkable success of Germany may be traced to the magnificent soil of the Elbe Valley, similar to the very best soils in France; the establishment of large factories, the use of diffusion instead of presses, selection of roots for quality, great care in cultivation and bringing in the roots, use of manures, great care and scientific study in manufacture, and cheapness of field labour. These are the reasons which caused Germany to advance from 200,000 tons in 1870 to 1,123,000 tons in 1883-5, whilst France had gone from 296,600 tons to 400,000 tons in 1883-4, and dropped in 1884-5 to 272,000 tons. (Germany was then producing a root which gave 10.78 per cent. of sugar against about 6 per cent. in France.)

A heavy fall in prices from 16s. to 10s. caused a crisis in the year 1884-5, and France cried out that she was being ruined and must have bounties like the Germans, whereupon the law of 1884 was passed and framed in such a way that the manufacturer had great advantages in producing a rich root, the "prise en charge" being fixed at 6 per cent. on refined sugar, rising later to 7.75 per cent., at which it now stands. The quality quickly began to catch up to the German standard, and manufacturers who vowed that in French soil a root giving more than 7 per cent. sugar could not be raised, to-day find 12 per cent. to 13 per cent. of raw sugar in their roots against about 14 per cent. in Germany. The Germans did not reply to this law in any way, but on the contrary, in pursuance of their original policy they reduced their bounties, which in 1887 were valued at 4 marks 90 per 100 kilos. of exported sugar, to 2 marks 12, which remained in force until 1892, when she ceased to give "primes à la production" and replaced them by a very moderate direct premium on exportation of 1 mark 25 per 100 kilos., which was to be further lowered in 1895. Ere this date, however, the effect of bounties in forcing the production regardless of consumption was making itself felt, and another crisis came in 1895, when the price of sugar fell to 8s. 6d. for raw sugar f.o.b. Hamburg—a price hitherto undreamt of.

The voice of the powerful agrarian party in Germany made itself heard, and after maintaining the law of 1894 for another year they doubled their direct bounty on raw sugar, making it 2 marks 50 from the 1st August, 1896. France took this action as a challenge, and the double bounty was referred to in the newspapers and afterwards in the Chamber as "Prime de guerre" by means of which Germany was to beat France out of the English market. The first demands of France were, however, very moderate, all they proposed to ask their Government for was a transference of 2 fcs. of the indirect bounty voted by the law of 1884 to a direct "Prime à l'exportation." The bolder spirits said "Ask and ye shall receive," and instead of 2 fcs. they asked for 4 fcs. direct increase. After a bitter fight Messrs. Méline and Ribot succeeded in passing the law of April, 1897. This law did more than anything else to precipitate the present crisis, the last straw towards which was the formation of the German Cartel or Trust a year ago. The crisis would have arrived sooner had not the Cuban war in 1895 interfered with the production in Cuba, Porto Rico, and the Philippines.

The Convention signed at the Brussels Conference on March 5 abolishes all bounties direct and indirect from the 1st September, 1903, and reduces to a uniform rate of 6 fcs. per 100 kilos. the high protective tariffs which alone in Germany and Austria make the formation of Cartels or Trusts possible. The effect of the bounties has been to increase production and reduce the consumption in the producing countries, and, as many men here have seen for a long time, the only cure is to withdraw the bounties and increase the consumption at home.

NEW BOOKS, etc.

ABEL HEYWOOD AND SON. (Manchester, 1900.) *The Making of the British Colonies. A short account of the Origin and Growth of the Principal Colonies of Great Britain.* By the AUTHOR of *The Making of Europe*, (Nemo). Svo., pp. xi. + 167. This book is designed as a text-book for schools, and contains a series of sketches, written in a terse and graphic style, giving an account of the origin and growth of the principal British Colonies, and some idea of their future development. A correct knowledge of the various portions of the British Empire is most essential at the present time, especially to the younger generation in England, many of whom may become settlers in the colonies, and should make themselves intimately acquainted with the prospects and capabilities of these new lands. This information will be found in a condensed and readable form in this volume, which will also be of interest to general readers.

A. W. BAYLY & CO. (Lourenço Marques.) *The Delagoa Directory for 1902. A Year-Book of Local Information regarding the Port and Town of Lourenço Marques.* Fourth issue. Svo., pp. 100. (Price, 2s. 6d.) This Year-Book contains useful data and information concerning Lourenço Marques, the port of Delagoa Bay, which has been termed the finest harbour in South Africa. The development of Lourenço Marques has been greatly retarded by the apathy of the Portuguese, who are slow to introduce many much-needed improvements, and also by the reputation the place has acquired for unhealthiness, owing to the swamp-land in its vicinity. This swamp is now being rapidly filled up, and the sanitation is better attended to. The town and suburbs are well lighted by electricity and the water supply is fairly satisfactory. The harbour works have been commenced, and a system of electrical tramways has been arranged for, to be completed within 22 months. The population is about 6,000, of whom about 3,000 are Europeans. As Lourenço Marques is the natural outlet for the produce of the Transvaal, it is likely in the near future to become of great commercial importance. The Directory should prove valuable to business men and manufacturers who may desire to open up commercial relations with Delagoa.

EDWARD LLOYD, LTD. (London.) *The Municipal Year-Book of the United Kingdom for 1902.* Edited by ROBERT DONALD, Editor of *The Municipal Journal*, and *The London Manual*. Svo., pp. xxxiv. + 578. (Price, 3s. 6d.) This work contains useful information and statistics relating to the various Boroughs of the United Kingdom, arranged in a concise form for reference, together with lists of the Members of the Councils and chief officials. The Urban and Rural District Councils are also given, and the work of municipal bodies with regard to telephones, water and gas supply, electricity, tramways, and the housing of the working classes, is also fully recorded. Last year showed a considerable increase and development in municipal work. There was a great extension of tramway enterprise, and much activity was displayed in municipal housing. The new Act which enables municipal authorities to build outside their own boundaries

is being taken advantage of. This Year-Book is a most useful work of reference on municipal matters, and its value increases yearly as the work of the local authorities becomes more widely extended.

EDWARD STANFORD. (London, 1901.) *The Gold of Ophir, whence brought and by whom?* By Professor A. H. KEANE, F.R.G.S. Crown 8vo., xviii. + 244 pp. (Price, cloth 5s. net.) The mystery which has enveloped the "Land of Ophir" appears now to have been dispelled, as Professor Keane in his interesting essay proves almost conclusively that the "Gold of Ophir" was derived from Rhodesia (Havilah) and was worked and brought thence by the Himyarites (Minceans and Sabceans), by way of Sofala (Tarshish) to Dhafar in South Arabia, which Professor Keane identifies with Ophir. From Ophir the gold, together with the spices grown on the neighbouring Mt. Sephar, was carried to Ezion Geber in the Red Sea, and on to Jerusalem by caravan. The re-discovery of the Zimbabwe monuments in Rhodesia, with careful explorations of the whole ground by the late Mr. Theodore Bent, Mr. R. Swann, and others, and the mapping-out of the numerous ancient workings, have given the indispensable clue to the solution of the Ophir question. The prototypes of these Rhodesian monuments have been found in the Himyaritic ruins of Yemen, showing that the old gold workings found south of the Zambesi are to be ascribed to the ancient Himyarites of South Arabia. Professor Keane has consulted all the published materials and evidence bearing on the question, and his book will be found most interesting by biblical and archaeological students.

GEORGE ALLEN. (Charing-cross-road, London, 1902.) *The Literary Year-Book and Bookman's Directory, 1902.* Edited by HERBERT MORRAH. With portrait of Sir Walter Besant. Sixth issue. 8vo., pp. 468. (Price, 3s. 6d.) The present issue of this Year-Book shows a considerable improvement as compared with previous editions, being more complete and representative. The Directory of Authors has been greatly enlarged, and much additional information will be found in the other sections of the work. Great care and labour have been bestowed on the compilation of the volume, which will be found a handy work of reference by all who are engaged in literary work or have any connection with books.

HARRISON AND SONS. (London, 1901.) *Our Empire, Past and Present.* By the EARL of MEATH, M. H. CORNWALL LEIGH, LL.A., and EDITH JACKSON. With Portraits, Illustrations and Maps. Vol. 1.:—Great Britain in Europe. 8vo., pp. 417. (Price, 7s. 6d.) This work will be issued in five separate volumes, each complete in itself, and the series is designed to show the growth of the British Empire from the earliest times down to the present. The first volume deals with Great Britain in Europe, and opens with a short record of Imperial progress. This is followed by a chapter on the growth of freedom and government at home. The growth of sea-power, the chief factor in the expansion of England, is fully described, and also the making of the United Kingdom, by the union of Wales, Scotland, and Ireland to England. The volume concludes with an account of the European dependencies of Great Britain—the Isle of Man, the Channel Islands, Gibraltar, Malta and Cyprus. The book will serve to show how the Empire has been built up, and increase the desire to learn more of the immense opportunities that have been opened up for the benefit of its population, and of the world at large. The compilation of the volume has been carried out with evident care and attention to accuracy, it is well illustrated, and some useful maps are inserted. It is prefaced by an admirable portrait of the late Queen Victoria, to whose memory the work is dedicated.

HORACE MARSHALL AND SON. (London.) *The Story of Egypt.* By W. BASIL WORSFOLD. (*The Story of the Empire Series.*) Sm. 8vo., pp. 225. (Price, 10s. 6d.) This volume of *The Story of the Empire Series* contains a concise and lucid account of the British occupation of Egypt, from which the country has derived so much benefit. A brief résumé of the history of Egypt from the earliest times is given, and is followed by a rapid survey of the events that led up to the revolt of Arabi Pasha, and the introduction of British control over Egypt in 1883. The improvements effected in the condition of the country since that date are clearly shown. The progress made, both materially and morally, is most striking, especially as regards the administration of justice, and the increase of education. The whole aspect of the country has been changed, and where, before the advent of British rule, the people were generally in a most wretched state of poverty, now the Fellaheen and peasant proprietors are able to pay their way. The population of Egypt has increased in 15 years by 2,920,486, i.e., 43 per cent. Mr. Worsfold's book will be read with interest, as it conveys a clear idea of the peculiar conditions in which Egypt is placed, and the difficulties which have been overcome by the British officials who have had to administer its Government.

JOHN MURRAY. (London, 1902.) *The Constitution of the Commonwealth of Australia.* By Professor W. HARRISON MOORE. 8vo., pp. xix. + 395. (Price, 16s. net.) This book contains an ably-written exposition of the new constitution of the Commonwealth of Australia, which will be of interest to all who may desire to become acquainted with the growth and establishment of the Federal Government. In the opening chapters the author, who is Dean of the Faculty of Law in the University of Melbourne, deals fully with the sources of the laws and institutions of the Colonies, and the history of Australian Federation. He then gives lucid explanations of the various chapters and clauses of the Commonwealth Act, the nature and authority of the Federal Commonwealth, and its "Constitution," which follows the plan of that of the United States in the distribution of the functions of Government—legislative, executive, and judicial—to three separate departments. The legislative powers of the Parliament, and the relation of the legislative authorities, i.e., The Imperial Parliament, the Commonwealth Parliament and the State Parliament, are also clearly shown. The volume is a valuable contribution to the literature on the subject, and will doubtless become a standard work of reference.

SPOTTISWOODE & CO. LTD. (London, 1902.) *The Stock Exchange Official Intelligence for 1902.* Edited by the SECRETARY OF THE SHARE AND LOAN DEPARTMENT. 21st year. By authority of the Committee of the Stock Exchange. Sm. 4to., 9" x 8": cxliii + 2,000 pp. (Price, 50s.) This well-known work requires no recommendation, as it occupies the highest place as an authority on financial matters connected with British, American, and foreign securities. The statistics and information contained in this edition have been carefully revised and brought up to date, and the system of arrangement successfully adopted last year has been continued. This present volume includes a special article entitled "Local Taxation in England and Wales," which, besides setting out the conclusions of the Royal Commission, contains a review of the existing system of local taxation, and will be found a trustworthy guide by those who desire to make themselves more fully acquainted with a subject which intimately concerns every rate-payer. The notes which it is now customary to supply upon the legal decisions of importance during the year will be found in the article headed "Company Law in 1901"; the National Debts of the World, Colonial Finance and Development, Indian Finance, Municipal and County Finance, and British Railways are also fully dealt with. The number of Companies regarding which particulars are furnished is larger than ever, though the bulkiness of the volume has not been increased owing to the admirable way in which its compilation has been carried out.

THE COPP, CLARK COMPANY, LIMITED. (Toronto, 1901.) *A Manual of the Constitutional History of Canada from the earliest period to 1901.* By Sir J. G. BOURINOT, K.C.M.G., LL.D., D.C.L. New Edition, revised and enlarged. La. 8vo., pp. 246. This book was first published in 1888, but to make it as useful as possible to students it has been thoroughly revised and enlarged, and a new edition published. The author has completed to date the summary of those judicial decisions which have so far laid down important principles for the interpretation of a constitution which has evoked much learned argument in Canadian Courts and Legislatures. A chapter on the practical operations of the principles of parliamentary government in the Dominion is also added, and the text of the British North America Act, and of the amending Imperial statutes,

is given in full at the end of the book. A complete list of the many authorities, cited in the text of this volume, will also be found useful to students who wish to investigate the constitutional history of Canada in the most thorough manner.

WITHERBY AND CO. (London, 1902.) *Lean's Royal Navy List for April, 1902.* Founded and edited for 22 years by Lieut.-Col. FRANCIS LEAN, R.M.L.I. La. 8vo., pp. xxviii + 480. (Price, 7s. 6d.) This well-known publication needs no further recommendation for its usefulness to all connected with the Royal Navy, as a work of reference. It has now entered upon the twenty-fifth year of its existence, the present issue being the ninety-eighth number. As an authentic record of naval history it has attained a well-deserved reputation on account of the labour spent on its compilation. The editor now presents it as a complete "encyclopædia" of our first line of defence. Attention is specially directed to the records of the war, and meritorious services of the officers of the Royal Navy (not to be found elsewhere), and of the Royal Marines and Royal Naval Reserve; also to the details of civil appointments held by officers in the Retired Lists. In the list of ships will be found recorded the victories of famous battle-ships bearing the same name, forming an interesting record of their war services.

CITY BRANCH OF THE IMPERIAL INSTITUTE, AT 49, EASTCHEAP, LONDON, E.C.

The CITY BRANCH OF THE IMPERIAL INSTITUTE embraces:—

A SAMPLE ROOM for the display of raw and manufactured products from the Colonies and India, for which it is desired to find openings in markets at home and abroad.

AN INFORMATION OFFICE where enquiries relating to industrial, commercial and other matters connected with the Colonies, India and Foreign Countries are received and promptly dealt with.

A NEWS ROOM supplied with:—

- (a) Hand-books and directories of the British Empire, including many pamphlets (for free distribution) dealing with Canada, the Australian States, New Zealand and South Africa.
- (b) The chief trade papers of Great Britain, the Colonies and India.
- (c) Many commercial periodicals of the United States, Germany, France, Austria, etc.
- (d) Market reports, prices-current, official reports and statistics.

The City Branch is in constant communication, by telephone and messengers, with the Imperial Institute, South Kensington. Curators and other members of the Imperial Institute staff will attend at the office at stated times and by special appointment, to deal with enquiries and to assist in establishing or facilitating business relations with mercantile houses, etc., in the Colonies and in India.

1. The Sample Room is open free to the public, by introduction.
2. The News Room is free to Fellows of the Institute, as is also the Enquiry Office for the supply of such information as does not involve special research or correspondence.
3. A subscription of the sum of one pound per annum, payable in advance, secures the free use of the News Room, and the supply, free of charge, of information not involving special research or correspondence.
4. Subscribers of one pound per annum are also entitled, on presentation of their members' tickets, to inspect, free of charge, any maps or charts, included in the Map Room collection at the Imperial Institute, South Kensington, or to consult any works, or official papers, included in the Institute Library.
5. Non-Subscribers to the City Branch can be supplied with information upon the following terms:—
 - (a) First enquiry, not involving special research or correspondence, free.
 - (b) For each subsequent enquiry, not involving special research or correspondence, one shilling.
 - (c) For each enquiry, involving special correspondence, or reference to home-experts, etc., five shillings.
 - (d) For each enquiry involving Colonial or Foreign correspondence, ten shillings, or by special arrangement, if likely to be voluminous.
6. Subscribers will have to pay the charges specified under (c) and (d) in the foregoing clause, and Fellows will have to reimburse the Institute any out-of-pocket expenses incurred in connection with enquiries coming under those heads.

7. The Information Office will undertake to obtain analytical or other examinations of samples by competent Experts, upon payment, by persons submitting them, of the usual professional fees, to be previously specified, and agreed to by the applicant.

8. The Institute will undertake the supply, at cost price, of translations, into any language, of trade circulars, prices-current, etc., the conversion of weights, measures, coinages, etc.

STATISTICAL NOTES.

World's Production of Gold.—The following table, taken from a statement compiled in the Statistical Branch of the Registrar General's Office, Perth, W. A., mainly from official returns, shows the World's Production of Gold during the years 1891, 1894, 1897, and 1900:—

SCHOOL OF MODERN ORIENTAL STUDIES.

Founded by the Imperial Institute in union with University College and King's College, London.

In 1887 it was suggested that a school of Modern Oriental Studies should be organized as a branch of the Institute, in imitation of the very efficient establishments of this kind which are carried on, with Government resources, in France, Germany, and Austria. The promulgation of this proposal led to negotiations with the authorities of University College and King's College, London, which resulted in their co-operation with the Institute in the establishment of the School. A Special Committee having been appointed to decide upon a system of work, it was arranged that classes for instruction in the Oriental languages required by students qualifying for examinations for the Indian Civil Service, should be held at University College, while modern Oriental languages, other than the Indian languages, should be taught at King's College, and that the Imperial Institute should undertake the general administrative and financial work. The School was officially opened in January, 1890, when an inaugural address was delivered by Professor Max Müller at the Royal Institution, in the presence of His Royal Highness the Prince of Wales. The daughters of the late Colonel W. J. Ouseley (Bengal Army) have established and endowed, in his memory, three scholarships, in Arabic, Persian, Hindustani, and other Oriental languages, in connection with the School, each one of the value of not less than £50 per annum. The following Scholarships have already been awarded:—

YEAR.	SUBJECT.	EXAMINERS.	AWARDED TO.
1892	Arabic .	{ Dr. WELLS Prof. SALMONÉ	No Competitors.
1893	Arabic .	Dr. WELLS	Mr. HENRY LEITNER, junr.
"	Persian .	{ Mr. JOHN T. PLATTS MIRZA HUSSEIN KULI KHAN	Mr. E. DENISON ROSS.
1894	Hindustani .	Mr. JOHN T. PLATTS	No Competitors.
"	Persian .	Dr. ROBERT BRUCE	Mr. DIWAN TEK CHAND.
"	Chinese .	Sir THOMAS WADE	No Competitors.
1895	Turkish .	Dr. WELLS	Mr. L. STENNETT AMERY.
"	Hindustani .	Mr. J. T. PLATTS	Mr. ASGHAR ALI.
"	Chinese .	Mr. W. A. PICKERING, C.M.G.	No Competitors.
1896	Burmese .	Gen. R. D. ARDAGH	Mr. LEE AH YAIN.
"	Arabic .	Dr. WELLS	Mr. H. G. SARWAR.
"	Marathi .	Mr. J. W. NEILL	Mr. V. R. PANDIT.
1897	Gujarati .	Dr. S. A. KAPADIA	Mr. RUSTUM D. N. WADIA.
"	Persian .	Mr. J. T. PLATTS	Mr. P. S. PATUCK.
"	Chinese .	Mr. W. A. PICKERING, C.M.G.	No award.
1898	Bengali .	Prof. J. F. BLUMHARDT	Mr. B. C. GHOSH.
"	Turkish .	Dr. WELLS	Lieut. A. M. SETON, R.A.
"	Chinese .	Mr. W. A. PICKERING, C.M.G.	No Competitors.
1899	Arabic .	Dr. WELLS	Mr. G. A. KHAN.
"	Persian .	Dr. ROSS	Mr. R. M. DAVIS.
"	Sanskrit .	Prof. C. BENDALL	Mr. S. K. GHOSH.
1900	Hindustani .	Mr. J. T. PLATTS	Mr. N. HAGOPIAN.
1901	Marathi .	Prof. J. W. NEILL	Mr. J. R. MARTIN.

An OUSELEY SCHOLARSHIP of £50, tenable for two years, will be awarded this year, should sufficient merit be shown, for proficiency in PERSIAN. No person will be admitted to competition for a Scholarship in a language which is his own mother tongue, nor for a Scholarship in a language allied to his mother tongue.

The examination takes place early in July, 1902.

Competitors must give notice on or before July 1, 1902.

The ages of Candidates are to be above 17 and under 25 years on January 1 of the year of examination.

Further particulars may be obtained from the Secretary, S.M.O.S., Imperial Institute, S.W.

GENERAL INFORMATION FOR INTENDING STUDENTS AT THE SCHOOL.

The classes which the "School of Modern Oriental Studies" comprises, are divided under two heads.

DIVISION I. includes classes for all Oriental Languages especially required by Students qualifying for examinations for the Indian Civil Service, the instruction being of the same character as that provided for some time past at University College and at King's College. This Division includes instruction in Sanskrit, Bengali, Hindi, Hindustani, Tamil, Telugu, Punjabi, Pali, Marathi, Gujarati, Arabic, and Persian.

DIVISION II consists mainly of classes for Modern Oriental Languages other than the Indian Languages.

The courses of tuition are of a practical rather than of an academic character; they have particular reference to commercial and official requirements and to the facilitation of colloquial intercourse with natives of Oriental Countries.

It is in contemplation, so soon as the number of students warrants the expenditure, to secure the services of native readers and teachers of conversation in connection with the classes of this Division.

The classes under this Division are conducted at King's College, where arrangements will also be made for the establishment of evening classes.

The Languages taught in Division II. comprise Colloquial Arabic, Armenian, Modern Greek, Colloquial Persian, Russian, Turkish, Chinese, Burmese, Japanese, Malay, and Swahili.

Arrangements have been completed by the Managing Committee and approved of by the Governing Bodies of the Imperial Institute and of the two Colleges, for the pursuit of studies relating to the history, literature, commercial and physical geography, political economy, and the natural and industrial resources, of the countries and districts in which the various languages are used.

Special Lectures or courses of Lectures will be delivered from time to time, in connection with the School, by experts or specialists, in any of the foregoing subjects.

There are three terms, of about ten weeks, in each year, as follows:—

SPRING TERM—commencing about the middle of January.

SUMMER TERM—commencing early in May.

AUTUMN TERM—commencing about the middle of October.

A fee of THREE GUINEAS per term will have to be paid, in advance, by each Student for each Language taken up for instruction. This payment will entitle the Student to the use, within the College, of text books, dictionaries, and works of reference required in connection with the particular Language taught, and to the use of all the facilities which it is proposed to secure in the development of the School.

Accommodation is provided at the Imperial Institute to enable Students to pursue their studies at hours when the classes are not held. The Libraries of both Colleges will be open to Students in any of the classes of the School, during the usual hours of study.

Intending Students should communicate with the Secretary at the offices of the Imperial Institute, London, S.W., where the registration of Students will take place, and where all information regarding the School will be supplied.

Rubber Forests.—Lord Cromer, in a recent report to the Foreign Office, states that considerable quantities of rubber trees are reported in many of the districts of the province of the Bahr-el-Ghazal. Mr. Broun, the Director of Woods and Forests, has been despatched to report on the possibilities of re-opening the india-rubber trade of the Bahr-el-Ghazal, which, in former days, was one of the principal sources of revenue of that district. It is also hoped, in the near future, to develop the rubber forests in south-western Kordofan, which, from all accounts, are of great importance.

Indian Cotton Trade.—The cotton industry of India, especially the mills in Bombay and the district started to employ native industry, are, says the *Drapers' Record*, in a very bad way, and there is an earnest appeal being made from India to England, now that the Budget shows a surplus of over four millions sterling, that the excise duty of five per cent. on local manufactured cotton should be at once taken off, in accordance with official promises made at the time of its imposition. There is now over nine millions sterling invested in Indian mills employing native labour. Twenty of them are in liquidation, and, for the last three years, hardly one of them has paid a dividend, or even earned the necessary legal amount to be set aside for wear and tear, and depreciation of machinery.

The Mining Industry of New South Wales.—The Under-Secretary for Mines has, so far, completed his compilation of the statistics of the past year's work in the State of New South Wales as to admit of advance particulars being given, some of which are of general interest. The total yield of gold for the year 1901 was 267,061 oz., equal to 216,888 oz. fine, valued at £921,282, as compared with 345,650 oz. (281,214 oz. fine) valued at £1,194,521 for the year 1900, a decrease of 78,589 oz. and £273,239 in value. This is the lowest yield recorded since 1894, but is in excess of any yield previous to that year back to the year 1875. A number of satisfactory and payable returns are recorded from dredging operations, but the year's operations have shown that some of the holdings on which plants were erected before a proper examination of the ground was made have proved unsuitable for dredging, and work has consequently been abandoned. The gross value of the metallic contents of the silver, lead, and zinc ores raised is not at present available, but the declared net value of the silver, lead, and zinc exported during the past year was as follows:—Silver, silver-lead, and ores, £1,854,463; lead (pig, etc.), £100,501; zinc (concentrates), £4,057—a total value of £1,959,021, showing a decrease of £828,429 on the value of the output for the year 1900. The most gratifying feature during the past year was the sustained activity in the coal trade. The quantity of coal raised during the year was 5,968,426 tons, valued at £2,178,929, being an increase of 460,929 tons, and £510,018 in value over the previous year, and is the largest output yet recorded.

MONTHLY COMMERCIAL AND INDUSTRIAL SUMMARIES.

GENERAL COMMERCE AND INDUSTRY.

British, Belgian and American Locomotives.—The comparative merits of British, Belgian and American locomotives in Egypt form the subject of a report by the Earl of Cromer in a Parliamentary paper just issued. The report was supplied at the request of the Foreign Office in answer to Sir Alfred Hickman's question in the House last May as to the consumption of fuel in the American and Belgian locomotives in use on the Egyptian railways. Lord Cromer says that it cannot be doubted that the main reason why so many orders for railway and other plant required in Egypt have recently been given to America is that American firms have been able to execute them with extraordinary rapidity. Discussing the results obtained at recent trials between locomotives of various types, Lord Cromer says:—"The general conclusion to be drawn from these trials is, I think, that, in respect to price, British manufacturers can well hold their own in cases where special designs have to be executed; that, in respect to quality, the work they turn out is at least equal, and often superior, to that of American or Belgian competitors; and that, in respect to the consumption of coal, they have decided superiority over American, though not, apparently, over Belgian manufacturers. The British weak point is the time required for executing orders. It is to this subject that I venture to draw the special attention of all who may be interested in the matter. I am not competent to express any personal opinion as to the extent to which it would be possible or desirable to imitate the Americans in adopting the principle of standardisation, on which the low prices and quick delivery of the American manufacturers mainly depend."

COLONIES.

British Central Africa and the South African Customs Union.—The Blantyre Chamber of Agriculture and Commerce has been very carefully considering whether British Central Africa should or should not join the South African Customs Union, if the opportunity is afforded it. The one argument against the step seems to be the assertion that the effect would be to increase the cost of living in British Central Africa by 50 per cent., a statement which has been received by the Blantyre paper—the *Central African Times*—as a very extreme exaggeration. This authority points out that if the growing of produce is stimulated in British Central Africa, and more of the household commodities consumed there, such as jams, manufactures, and so on, are imported from South Africa, the benefits accruing will far outweigh any additional cost due to the import tariff of the Customs Union. British Central Africa is essentially an agricultural country, and, in the opinion of the Blantyre paper, it is even a coffee country. Meanwhile a tariff wall is being built up around it. In addition to the colonies already included in the Union, it is only a question of time when Rhodesia will join, and it is understood that Portuguese East Africa has been invited to take part in the prospective conference on the subject. The present Portuguese, German East African, and Congo Free State tariffs are said to be prohibitive enough, and hence it is argued that if British Central Africa remains isolated as regards Customs arrangements, the only open market for her produce is likely to be London. South Africa offers the nearest and best market, and, continues the Blantyre paper, "were we in the Union we would not only benefit by being free from the duty, but also by preferential rates on the Government railways. South Africa as a market for coffee, tobacco, mealies, and other products is certain to expand very much in the near future, owing to the large access of population which it has received, and will continue to receive, in consequence of the war. Increased traffic with South Africa would mean lower freights, and consequently higher profits." Moreover, it is added, a large amount of money would be kept in the country, as there would no longer be any reason for sending to Denmark for butter, or to Switzerland for milk, and it would be "an easy matter" to produce tea, sugar, flour, and other commodities of a like nature in British Central Africa. The community would benefit by increased exports, the transport companies would have increased traffic, trade would again flourish, and the natives would share in the general prosperity.

Hæmatite Iron in Johore.—A correspondent of *Iron and Coal Trades Review* reports the discovery of what shows, by an analysis, to be a high grade hæmatite iron in the south-eastern part of Johore. This hill or small mountain rises to a height of 700 feet, and iron shows on the surface from base to top. This solid outcrop is, approximately, 400 feet wide by 2,000 feet long, and lies between Sungei Asah and an unnamed creek. There are several open cuts at the base of the hill that show solid ore in the face; these trenches are sufficient to demonstrate that the quantity of ore is great. This ore can be loaded on steamers or sailing vessels at small cost, and, could one find a market, there would be no trouble to ship as much as 500 tons a day. With regard to sampling, the correspondent says that he has taken the poorest ore he can find, and the results are as follows:—The ore consists of hæmatite, with a little earthy matter or gangue. On analysis, it gave iron, 68.20 per cent. This shows the ore to be nearly pure oxide of iron, and of an excellent quality.

North Queensland and Army Remounts.—With reference to the proposals which have been made from time to time for the establishment of purchasing and remount depôts in Australia, a correspondent of the *Times* makes some suggestions with reference to North Queensland, which he feels confident would, if carried out, not only give a valuable impetus to horse breeding in those parts, but would, in a short time, furnish the military authorities with a class of remount equal to any in the world. In the first place, the Government representatives should contract directly with the breeders for a supply of horses at a fixed rate of purchase, and make contracts, say, for ten years, or even a longer period, if the number of horses desired is large. Breeders take an interest in their horses, and, once rid of the one-man contractor, would enter into competition with each other to secure more extensive contracts. At about £10 to £12 North Queensland could supply horses of a class above the animals now delivered in India at £40 to £50.

To enable the Remount Department and their agents to deal directly with the breeders, it would be advisable that they should secure land in North Queensland for the establishment of depôts. Good and suitable land could be rented from the State at about 2d. per acre. If such a depôt or depôts were established on the North Queensland Railway, the Remount Department could keep their selections for a year at a cost not exceeding 10s. per annum per horse. They could then break them to any desired extent and dispose of any misfits either by sale or by arrangement with the original breeder. Thus at the end of the year the officials responsible for the depôts would have broken horses which had been trained for the last week to take "hard" food, of an excellent class, ready for shipment, at about £16 per head. It is hardly necessary to point out the advantages which North Queensland possesses for the shipping of horses.

The present time would be most advantageous for starting the scheme, even if it were only upon experimental lines.

Owing to the recent droughts, the supply of sheep and cattle is much reduced, so that the number of horses on the stations is far above the present requirements, and this in itself, if a certain market was in sight, would be an inducement to the Queenslanders to take to breeding seriously.

Western Australia.—EXPORT TRADE.—The February number of the *Monthly Statistical Abstract of Western Australia* gives the preliminary figures of the value of the most important articles of export in 1901. The following table gives a comparison with 1900:—

	1900.	1901.
Gold specie	£1,750,763	£2,807,841
Raw gold	3,799,116	3,941,797
Wool	270,718	378,135
Timber	458,461	572,354
Hides and skins	74,902	86,559
Pearls and shells	106,607	130,730
Sandal wood	39,038	73,931
Copper	33,937	110,769
Tin	57,050	52,102

FOREIGN COUNTRIES.

Demand for Fruit in China.—An American report says that the Chinese appetite for fresh fruit is strong, and apples are in great favour; the only obstacle to the creation of a large market is the inability of the masses to purchase. The average Chinaman does not distinguish the different varieties of apples, and if inferior grades could be sent at low rates, an extensive outlet could be created. Northern routes are the best for shipping green fruits. All shipments of apples for the northern ports of China should be sent by 1st October, on account of the danger of freezing if they arrive late in the season. If the fruit reaches North China in good condition, it will keep well, on account of the dry, cold climate. The presence of Russians in Vladivostok, Port Arthur, and Dalny will increase the market for apples.

Italian Chamber of Commerce in Bucharest.—The principal members of the Italian colony in Bucharest recently held a meeting at which it was resolved to establish an Italian Chamber of Commerce in the chief city of Roumania, and a committee of three members was formed to draw up the rules of the corporation. One of the first proceedings of the new Chamber will be the formation of a sample depôt of Italian goods suitable for export in Bucharest.—*Handels Museum.*

New Peat Briquette Process.—A briquette process for peat has been developed in Germany by G. Heine, and is being exploited by Mr. Hugo Krupp, of Hanover, Germany. The process will be of interest to those persons in this country who are watching developments in this industry. A large part of the expense of most peat handling processes, is the labour involved in cutting the peat from the bog and transporting it to the factory for treatment. In the Heine process, a portable centrifugal pump dredger is used to excavate the peat from the bog, rotary cutters being used on the suction pipe, so that the peat is reduced to a pulp. This pulp with about fifteen times its volume of water is carried by a pipe line to the briquetting factory. The pump's suction is so protected that stones and roots cannot enter, and sand and clay fall to the bottom of the bog. At the peat factory the peat pulp is delivered into a vat, from which it passes to a centrifugal separator, which extracts the bulk of water. The peat then passes to a cylinder press, which operates on a principle similar to that of a paper-making machine. Here the peat becomes a thin sheet which is carried by belt conveyors to a drying cylinder. These reduce the moisture to 15 or 30 per cent., an amount sufficient for briquetting. The peat, now a hot powder, is automatically fed to the briquetting machine, and is submitted to a pressure of about 2,000 atmospheres. The bituminous parts of the peat act as a cement and the product is hard coal-like clean briquette. Analyses of these briquette show, in percentage—carbon, 52.5; hydrogen, 4.8; oxygen, 22.1; ash, 9.0; water, 11.6. This corresponds in heating value to 4,850 calories per kilogram, as compared with 5,500 calories for ordinary coal, and 3,000 for wood. By carbonising the peat to a greater degree, the heating value may be increased. One metric ton of these briquette in Germany, is said to cost from 5s. to 7s. to produce, according to the size of the plant. A plant for producing 50 tons per day is said to cost £16,000.

Russian Chamber of Commerce in Alexandria.—At the instigation of the Russian Consul in Alexandria a Russian Chamber of Commerce was established there in January last, although there were already in existence, an Austria-Hungarian, English, French, Italian and Greek Chamber of Commerce. If, however, the amount of Russian trade with Egypt is taken into consideration, the establishment of the Chamber of Commerce is perhaps fully justified. The most important Russian exports to Egypt consist of raw products which are indispensable—principally petroleum, then wood for building purposes, flour, wheat and sugar. In a similar way the exports from Egypt to Russia consist of indispensable cotton produce for Russian textile manufactures—and different kinds of vegetables in small quantities. It is, however, not to be anticipated that much extension of business will be caused, as there is practically no real Russian colony in Alexandria, there being only five Russian commercial firms, the heads of which, with the Consul as president, form the Chamber of Commerce. No subscriptions are required and the expenses of the Chamber are paid by the Consul.—*Handels Museum.*

United States.—MANUFACTURES.—Some highly interesting figures are given in the *Census Bulletin of Manufactures* issued by the United States Government. The total gross value of products of manufactures, including Custom work and repairing, was given as \$13,040,013,638 in 1900, though it is pointed out that this total represented to some extent a duplication of products, owing to the fact that the finished products of many manufacturing establishments become the materials of other establishments in which they are further utilized and again included in the value of products. The net value of products of manufactures, after deducting the value of materials purchased in a partially manufactured form, is put at \$8,388,409,055. The total capital invested in manufactures in 1900 amounted to \$9,874,664,087. This was an increase of 51.3 per cent., as compared with 1890. Again comparing with 1890, the average number of wage-earners represented an increase of 25 per cent.; the amount of wages paid, an increase of 23 per cent.; the cost of materials used, an increase of 42 per cent.; and finally, the total value of produce, an increase of 39 per cent. Following are a few statistics illustrating the leading groups:—

	No. of wage-earners.	Total wages.	Value of product.
Textiles	\$682,978	\$219,229,265	\$966,924,835
Iron and steel	226,161	122,710,193	835,759,934
Slaughtering	68,534	33,457,013	786,603,670
Lumber and timber products	283,260	104,640,591	566,832,984
Flouring and grist mill products	37,073	17,703,418	560,719,063
Smelting and refining	24,504	15,973,626	358,786,472
Liquors	44,417	28,005,484	340,615,466
Boot and shoe factory products	142,922	59,175,883	261,028,580

LABOUR MARKET. COLONIES.

The following is the monthly report, up to 17th April last, compiled by the EMIGRANTS' INFORMATION OFFICE: **Canada.**—This is the best season for emigration to Canada. There is a good demand for competent men and boys who understand farm work and looking after stock, for female servants on farms and in towns, and for a limited number of carpenters, bricklayers, iron and steel workers and miners. In British Columbia the shingle manufacturing industry is very busy, and many new mills are being erected.

Australasia (New South Wales).—At Sydney the building trades have fallen off; the engineering trade is fairly well supplied with work, and there is a good demand for engineers; local shipping is good, and wharf labourers are well employed; plumbers are in very strong demand, especially for sanitary work; and there is a large demand for female servants. In mining districts there is a good demand for miners at collieries, but not at silver or gold mines. In country districts there is a good demand for farm labourers in the season, but the drought—which has now lasted some years—has seriously affected the demand for all kinds of country labour. At Young there is a good demand for bricklayers, carpenters, blacksmiths and female servants. At Orange and Jerilderie the only demand is for female servants. The cost of living has generally increased in the State, owing to the new tariff. A considerable number of men are being employed by Government on relief works. (**Victoria.**)—The hours of bricklayers have been generally reduced from 48 to 44 a week, and their wages increased from 10s. to 11s. a day. (**Western Australia.**)—The annual report of the Government Labour Bureau shows that there is a constant demand throughout the State for female servants; that mechanics—especially those in the building trades—are in demand at Perth and Northam, but not elsewhere; that there is no demand for miners on the goldfields, or at the coal mines; that labour is sometimes scarce at the timber mills; and that there is a good demand for farm labourers at 20s. to 25s. a week and board. (**New Zealand.**)—With the exception of Dunedin, where many hands have been out of work, the building trades have been busy almost everywhere, carpenters and bricklayers being especially well employed. The engineering trades have been only fairly busy, and at Dunedin many men have been out of work. The boot trade has been doing well in the smaller towns, and in Auckland good machinists are said to be scarce. The clothing trade has been, generally speaking, very busy. General labourers have been obtaining good wages at shearing, harvesting, scrub-cutting, road work, etc., but there does not appear to be any special demand for more.

South Africa.—Trained clerks from 20 to 40 years of age are wanted for service in the Army Service Corps in South Africa during the continuance of the war. Preference will be given to discharged soldiers and to single men. The pay is 5s. a day, and a free passage out and home. Candidates must present themselves to the nearest recruiting officer. (**Cape Colony.**)—There is a demand for skilled mechanics. The General Manager of the Government Railways notifies that there is a limited number of vacancies for apprentices in the large locomotive workshops at Salt River. (**Natal.**)—There has been a serious strike of several hundreds of railwaymen, on the Government refusing to raise their wages. The strikers have since resumed work, relying on the promise that their grievances will form the subject of a Parliamentary enquiry. The printers' strike has been compromised, the men accepting an extra 1s. a day, bringing the weekly wages up to 72s. The carpenters' strike continues, though about 100 men are working at the increased wage, viz., 16s. a day. There is stated to be a good demand for labour generally, especially for men in the building trades; but the great increase in the cost of food and rent—which has largely caused the above strikes—and the inability to land without a permit from the Permit Office, 47, Victoria-street, London, must be remembered by emigrants. (**Orange River Colony and Transvaal.**)—Only refugees, Government employees, and persons engaged in a service of a public nature, will be permitted to proceed to the Transvaal. Candidates for the South African Constabulary should apply to the Recruiting Officer, S.A.C. Recruiting Office, King's-court, Broadway, Westminster, S.W.; they must be good riders, good shots, single, strictly sober, and from 20 to 35 years of age; they will be given free passages to South Africa. Farriers also are wanted for this force. The number of suitable candidates for the Civil Service of the Transvaal and Orange River Colony greatly exceeds the possible number of vacancies, and no further applications can be entertained. A mounted and unmounted police force is being recruited for the towns of the Orange River Colony, but the number of local candidates is more than sufficient.

EMIGRATION AND IMMIGRATION.

* * *The Imperial Institute acts in concert with the Emigrants' Information Office (which is under the direction of the Colonial Office), of 31, Broadway, Westminster, S.W.; and also with the British Women's Emigration Association, now temporarily carrying on its work in rooms at the Institute. The Handbooks and Quarterly Circulars issued by the Emigrants' Information Office may be obtained at the Commercial Intelligence Office. Special information and practical advice respecting Canada and Cape Colony will also be furnished by the Curators of these Sections.*

UNITED KINGDOM.

British Women's Emigration Association.—The hon. secretary reports 679 applications made in the month ended April 21. The numbers of persons who embarked during this time were as follows: for South Africa, 15; Canada, 55 adults and 4 children; Australia, 11; and New York, 3.

The applications received at the London office of the Association in the Imperial Institute during the last twelve months, from persons wanting information or advice about emigration, amount to 3,851, as compared with 2,006 in the previous year. The interviews have amounted to 2,557, as compared with 1,097. Letters received, 10,337, as compared with 6,697. Letters sent, 8,658, as compared with 6,853. The increase in the desire for information has, of course, been principally with regard to South Africa. Personal interviews with applicants frequently save the colonies from the immigration of persons unsuited to their requirements, and at the same time save the bitter disappointment of failure to the individual.

In the early part of 1901, a strong and influential representative committee was formed in Cape Town called the "South African Immigration Association." Through the kindness of Mr. Rhodes and the De Beers Company, aided by some supporters in Cape Town, an admirable house was selected and furnished at Rosebank as an hostel. It was opened on May 1 by Lady Hely Hutchinson. The hostel is intended as a home where women can be received not only for a few days on their arrival, but also as boarders engaged in daily work. It is also an employment bureau for every kind of women's work.

The Bishop of Grahamstown, who takes the keenest interest in emigration work, lays great stress upon the kind of women wanted, "the best in every class, women of high character, firm religious principles, to reproduce the best traditions of the old country." It is hoped that Grahamstown will become a distributing centre for a large district. A committee is working at Durban, of which Mrs. Escombe is president and Mrs. Crofts hon. secretary. It has started a small fund, and undertakes to find rooms for a few days for travellers needing them.

A committee is being formed in Bloemfontein, but as yet no hostel has been required; should any girl need temporary shelter the Mother Superior has offered protection at St. Michael's Home, but arrangements are being made so that one will be ready by the time any considerable number of women are allowed to go out. A scheme which is being inaugurated to help trained women to start small farms on a co-operative system of their own is meeting with encouragement from those who understand the country and the difficulties in the way.

At present the temporary financial depression caused by the war renders any large development premature; but through the kindness of the Chartered Company, a hostel will shortly be opened in Salisbury, under the superintendence of Miss Dalby, where a few ladies having daily engagements, at the school and elsewhere, will reside with mission workers. The question of a hostel for Bulawayo is also under consideration. For the latter a lady of experience and ability has offered her services as superintendent gratuitously. Miss Dalby hopes to start with her mission workers early in May, and the opening of the railway between Salisbury and Bulawayo will remove many difficulties and greatly facilitate that freer circulation on which so much depends.

The special loan fund given by the Chartered Company has been of very great service to Rhodesians, and the generosity of the railway companies in granting free passes over their lines to persons recommended by the Association is gratefully recognised by all concerned.

Mrs. Wybergh was asked to establish a hostel at Johannesburg as soon as one was needed, and in September a cable was received through the Colonial Office asking for funds for this purpose. The South African Expansion Committee replied by cabling out £200 to start it. The hostel, a house in Bree-street, is already open, and receiving boarders, but owing to the difficulties in the return of refugees it cannot for a while be self-supporting.

The first call for immigrants has been for domestic servants, as there is a pressing demand for them in Johannesburg. We have already received permits for ten from Lord Milner, and they are all engaged by definite employers in Johannesburg at wages varying from £3 to £6 a month, under agreements to stay six months or a year, in most cases the passage money being withheld until the term of agreement has expired. It is hoped that before long there will be more openings for teachers, nurses, secretaries, shop-assistants, dressmakers, etc., but while the country is under martial law and permits are necessary, only a limited number can be sent out.

COLONIES.

The April circulars of the Emigrants' Information Office and the new annual editions of the penny handbooks show the present prospects of emigration, and may be obtained, free of charge, at more than 800 public libraries, Urban District Councils and institutions throughout the country.

This is the best season of the year for emigrants to go to **Canada**. Even inexperienced hands may get places, provided they are willing to learn and are strong; their wages at first will be nominal, but board and lodging will be supplied free. As a rule, single men are preferred everywhere, but married men, with wives competent to take charge of dairy or laundry, and families able to work have no difficulty in obtaining employment. Female servants also are in great demand on farms and in towns. In some parts there is a demand for miners, navvies, and general labourers. There is a good demand for men in the iron and steel works at Sydney (Cape Breton), Hamilton, Sault St. Marie, and elsewhere; and some demand throughout Canada during spring and summer for carpenters, painters, masons and others in the building trades.

In **New South Wales** the labouring classes generally are complaining of the increased cost of living, owing to the new tariff. Domestic servants continue to be in steady demand throughout the State. There are more than enough of ladies' helps, ladies' companions and governesses. The demand for female labour in such industries as tailoring and general soft goods continues, and there is a good opening for girls and women in this direction.

In **Victoria** there is no general demand for more labour, but a competent mechanic has not much difficulty in finding work. In country districts competent farm labourers and milking hands are very scarce, most men preferring the higher wages and shorter hours of the towns.

In **South Australia** there is practically no demand for more mechanics, but a skilled hand, such as a mason, bricklayer, engine fitter, blacksmith, joiner or carpenter can generally find employment after looking about for a little. In country districts there is good employment for agricultural labourers, for men able to work binders and strippers, for boundary riders, and for married couples without children for stations, but the local supply of labour is generally sufficient. There is no demand for miners.

In **Tasmania** miners and mechanics at Zeehan, Queens-town, and Gormanston, on the west coast, and in the surrounding districts are well employed; good fitters can generally get work without difficulty. In other parts of the State there is no general demand for more mechanics, but there is an opening for them if they have a little money. The supply of farm labourers is not quite sufficient, and skilled men can get work.

British East Africa.—OPENINGS FOR SETTLERS.—At a meeting of the European Colonists' Association of East Africa, held in Nairobi, Sir Charles Eliot stated that the climate was in every way suitable for European colonization. Besides the better-known parts, he thought that such comparatively distant districts as the Nandi escarpment possessed a most excellent climate, an ample water supply, and a fertile soil. He also recommended the Taru jungle. Merely nominal rents would be charged to any one disposed to try what could be done with this district. The Government would encourage settlers. Land laws were in course of preparation and would, he hoped, be promulgated within the next three months. They would probably include the grant of freeholds and be on the general lines of the regulations in force in British Central Africa. There had been proposals, he said, to settle Indians on land near the railway, but nothing further had been done, and it was not likely that Indians would be settled in the parts of the Protectorate colonizable by Europeans, but rather between Kibogoro and Kibas, near the lake, where the climate was damp and hot and more suitable for Asiatics than for white men. Mining laws would shortly be promulgated similar to those in force in Zululand. He was prepared to register at once any claim which prospectors might make to pieces of land on which minerals were found, and such claims would be dealt with under the mining laws. He had already urged the Foreign Office, he added, to establish model farms, and as soon as funds would allow of it he was sure that

the matter would receive favourable attention. It was also proposed to appoint a woods and forest department with a forester. A pamphlet will shortly be issued by the Association which will contain the necessary information required by intending settlers.

FOREIGN COUNTRIES.

German Emigrants to the United States.—The emigration from German ports to the United States, especially from Bremen, is assuming proportions far in excess of any previous records. During the first three months of this year 36,396 persons left Bremerhaven for America, against 31,347 in 1901 and 14,725 in 1898. In four years emigration has increased 147 per cent. The North German Lloyd Company are unable to cope with the rapidly-increasing stream of emigrants and are chartering ships from other companies. Over 75 per cent. of the emigrants belong to the Slavic races, and but a small portion of them can read and write. During the second quarter of this year over 60,000 emigrants, it is believed, will sail from German ports for the United States.

CUSTOMS TARIFFS.

COLONIES.

Canada.—TARIFF AMENDMENT.—With reference to the notice relating to the free entry of steel castings, in the rough, for the manufacture of scissors and hand shears, the *Canada Gazette* for 22nd March last contains an amended Order in Council dated 12th March, 1902, which provides for the addition to the list of articles which may be imported free into Canada of the following articles, viz.:—

"Malleable iron or steel castings, in the rough, for the manufacture of scissors and hand shears, when imported by manufacturers of scissors and hand shears to be used in making such articles in their own factories."

Cyprus.—IMPOSITION OF ADDITIONAL DUTY ON TOBACCO, ETC., IMPORTED IN PACKAGES WEIGHING LESS THAN 20 OKES NET EACH.—An Order in Council, dated 2nd January, 1902 (No. 348) has been issued, amending the Order in Council of 18th May, 1901 (No. 345), which provided for the imposition of an additional duty of 6d. per oke upon tobacco, cigars, cigarettes, and snuff imported through the *Parcels' Post* into Cyprus in packages weighing less than 20 okes net each.

The new Order in Council amends the Order in Council of the 18th May, 1901, by adding thereto the following clause:—

"(3) Whenever tobacco, cigars, cigarettes, or snuff are imported into the Island otherwise than through the *Parcels' Post*, under special permission from His Excellency the High Commissioner, in packages weighing less than 20 okes net each, there shall be levied and taken upon every oke or fraction of an oke of tobacco, cigars, cigarettes, and snuff so imported, in addition to the Customs duty thereon, a further import duty of one shilling."

The Customs duties imposed at the present time on tobacco, etc., imported into Cyprus are as follows:—

	s. d.
Tobacco, unmanufactured (except Tumbeki)	Per oke (2·8 lbs.) 0 6
Tobacco, unmanufactured, known as Tumbeki or Persian (including additional duty imposed under the Tobacco Law of 1899)	1 8
Tobacco, manufactured (except cigars, cigarettes, and snuff)	3 0
Tobacco, manufactured cigars	Per hundred 2 6
" " cigarettes	Per oke 5 0
" " snuff	5 0

Mauritius.—REVOCATION OF PROCLAMATION PROHIBITING THE IMPORTATION OF CERTAIN ARTICLES FROM REUNION.—A Proclamation, dated 11th March last (No. 8 of 1902) has been issued, revoking Proclamation No. 66 of the 14th December, 1900, whereby, in consequence of the existence of cattle plague in Reunion, the importation of certain articles (principally animals (dead or alive), rags, manures, plants, and vegetables) from that Island into Mauritius was prohibited.

Natal.—REGULATIONS UNDER EXCISE ACT, 1901.—The Natal Government Gazette for 25th February last contains Notices (Nos. 128, 130, and 131 of 1902), relating to regulations made by the Governor in Council, under the provisions of the Excise Act of 1901, as follows:—

1. Regulations as to methylated spirits made in, imported into, and stored in the colony.

Under these regulations it is provided, *inter alia*, that:—

"Imported methylated spirits mixed with any ingredient or substance of any description or kind, whatsoever, on being landed, must be placed in a warehouse approved by the Controller of Excise, and shall not be removed therefrom until after a sample of such spirits taken from each package or vessel as imported shall have been examined and certified by the Government chemist or other person authorised by the Minister, to contain not less than 80 per cent. of crude methyl alcohol."

2. Regulations as to the sale of methylated spirits by retail.

3. Regulations for payment of drawback of duty on rectified spirits, colonial compounds or liqueurs.

The above regulations came into force on 25th February, 1902.

New Zealand.—DECISIONS.—The following Decisions under order of the Commissioner of Trade and Customs (No. 685 of 4th March last), having reference to the Customs Tariff of New Zealand, have been received:—

Articles, and how classed.	Rate of Duty.
Corn starch and also potato-farina in casks or bags, when imported by or for a manufacturing confectioner, on declaration being made that the importation is to be used for moulding starch—	Free.
As confectioner's moulding starch	Free.
Druggists' shop-fittings, bottles for—	
As druggists' sundries (C.O. 675)	15 % ad val.
(This refers to bottles with painted labels; plain stoppered bottles are free under item No. 364).	
Fire extinguishers (Champion and Babcock)—	
As fire engines, including Merryweather's chemical fire engines	Free.
Gelatine, powdered and icing gelatine—	
As gelatine	20 % ad val.
Machinery, electric, including electric motors for mines, mining dredges or dairies—	
As machinery, electric and appliances	10 % ad val.
Manure mixer—	
As machinery for agricultural purposes	Free.
Rock drill—	
As machinery for mining purposes (C.O. 684) when supported by certificate or declaration that it is imported for mining purposes	"

Articles, and how classed.	Rate of Duty.
Sago-flour—	
As sago	Free.
Ships' segment lenses for mast-head lights	"
Tapioca-flour—	
As tapioca	"
Turbine for saw-mill—	
As machinery for saw-mills	"
Vacuum Company's mineral sperm-oil—	
As kerosene	"
"Xylolith" flooring—a mixture of sawdust and ground stone—	
As building materials, n.o.e.	"

Somaliland Protectorate.—CUSTOMS REGULATIONS.—By the Customs Regulations, dated 27th February, 1902 (No. 2 of 1902), under Article 32 of the "Somaliland Order in Council, 1899," the Tariffs are amended as follows:—

ZEYLA.

The import duty on "alcoholic liquors (except for harrar)" is as provided by Articles 1 and 2 of the "Alcoholic Liquors Regulations, 1901."

The following is the text of the Articles referred to:—

1. A duty at the rate of 2 rupees the gallon at 50 degrees centigrade shall be paid on all alcoholic liquors imported for sale or consumption in the Protectorate.

2. The said duty shall be augmented proportionally for each degree above 50 degrees centigrade, and shall be diminished proportionally for each degree below 50 degrees centigrade.

BERBERA AND BULHAR.

The export duties on mules and donkeys have been assimilated to those in force at the port of Zeyla, and are now as follows:—

Mules	8 rs. per head.
Donkeys	1 re. per head.

The present Regulations, *inter alia*, provide that:—

1. At the port of Berbera no goods (other than Government stores and goods and baggage of officials and live stock, which may be landed at the Shaab pier in the presence of a Customs officer) may be landed at or shipped from any other place than the Customs pier.

2. At the Ports of Zeyla and Bulhar all goods must be landed or shipped at the Customs pier and landing-stage opposite the Customs-house respectively.

3. No Customs duties shall be levied on goods exported from one Customs port of the Protectorate to another, except that goods exported from Zeyla to another Customs port of the Protectorate shall pay an import duty equivalent to the difference between the import duty at Zeyla and that at the port of destination.

4. All firearms, ammunition, and explosives shall be deposited in the custody of the chief Customs officer, and shall be subject to special Regulations made from time to time.

Trinidad and Tobago.—IMPOSITION OF EXPORT DUTIES FOR IMMIGRATION PURPOSES DURING 1902.—An Ordinance (No. 34 of 1901) provides for the imposition of duties, in aid of immigration, upon the following articles raised or manufactured in the Island of Trinidad and shipped for places beyond the limits of the colony during 1902:—

	Export Duties.
	s. d.
Sugar	Per 1,000 lb. 2 8
Rum	" 100 galls. 6 0
Cocoa	" 100 lb. 0 7½
Coffee	" " 0 7½
Molasses	" 100 galls. 2 0
Cocoanuts	" 1,000 0 7½
Copra	" 1,000 lb. 1 11

(And on lesser quantities in each case in proportion).

FOREIGN COUNTRIES.

France.—EXEMPTION FROM CONSUMPTION DUTY OF SALTS FOR AGRICULTURAL PURPOSES.—According to a recent circular of the French Director-General of Customs, it has been decided that the exemption from duty accorded by the Law of the 8th November, 1869, to denaturated salts intended for use as cattle food or as manure, or in the preparation of manure, applies only to exemption from the consumption tax. Consequently, imported salts intended for the uses specified can only be exempted from the consumption tax on proof that the import duty leviable thereon has been paid.

Germany (South West Africa).—REGULATIONS AS TO IMPORTATION OF ANIMALS INTO GERMAN SOUTH-WEST AFRICA.—The *Deutsches Kolonialblatt* for the 1st March contains the text of a Decree of the Governor of German South-West Africa, issued with a view to the prevention of cattle diseases in the Protectorate. The following are the principal provisions of the Decree:—

The importation into the Protectorate of animals suffering from any contagious disease is forbidden.

In the case of imported horses, donkeys, mules, binnies, cattle, sheep, goats, and pigs, the importer is required to produce the following certificates:—

(a) A certificate from the proper authorities at the place of origin, stating that no contagious diseases affecting the particular kind of animal to be imported has occurred at that place.

(b) A certificate signed by the police authorities at all the stations on the route followed by the animals up to the frontier of the Protectorate, stating that the animals have not, during transit through their districts, touched any place at which the existence of contagious disease has been proved.

(c) In the case of animals imported from Europe an additional certificate is required, showing that the animals were inoculated with tuberculin before embarkation, and that no rise in the warmth of the body exceeding 0·5 degrees has taken place.

A *précis* translation of the regulations, containing a list of the diseases declared contagious, may be seen on application at the Commercial Intelligence Branch of the Board of Trade, 50, Parliament-street, S.W., any day between the hours of 10 a.m. and 5 p.m.

Italy.—SURTAX ON EXPLOSIVES.—The Italian *Bollettino Ufficiale* for February last, contains the text of revised regulations, in virtue of which the internal manufacturing tax on gunpowder and other explosives and the surtax on gunpowder and other explosives imported from abroad are fixed at the following rates:—

Blasting powder, and powder in the form of dust, 50 lire per 100 kilograms. (£1. 0s. 4d. per cwt.).

Sporting powder, and blasting compounds other than blasting powder, 125 lire per 100 kilograms. (£2. 10s. 10d. per cwt.).

All other explosives for sporting purposes or for firearms in general, 250 lire per 100 kilograms. (£5. 1s. 7d. per cwt.).

Powder in granular form, employed in the manufacture of miners' fuses, shall be entitled to claim the return of the difference between the duty on sporting and on blasting powder.

The complete text of these regulations, in the original, may be seen by those interested at the Commercial Intelligence

Branch of the Board of Trade, 50, Parliament-street, S.W., any day between the hours of 10 a.m. and 5 p.m.

Paraguay.—TARIFF MODIFICATIONS.—H. M. Consul at Asuncion reports that the import duties leviable in Paraguay on provisions, wines and spirits, have been increased by 100 per cent., and that export duties have been increased as follows:—

On hides, by 25 cents gold (rs. 3d.) each.

On milled yerba mate, by 3 cents gold (1½d.) per 20 lb.

On unmilled yerba, by 4 cents gold (2½d.) per 20 lb.

United States.—CUSTOMS DECISIONS.—The following is a list of some Decisions affecting the application of the Customs Tariff and Regulations:—

Garnets cut and polished so as to be in a condition suitable for jewellery, are dutiable as "precious stones advanced in condition by cutting," under para. 435 of the Tariff, at the rate of 10 per cent. *ad val.*

Tuberine is held to be a description of glue, and not starch, and is, therefore, dutiable under para. 23 of the Tariff according to value.

Fish sounds, cleaned and dried are not free of duty under para. 496 of the Tariff, but are dutiable under para. 23, according to value, even though the manufacturing process may have been imperfect and the product of inferior quality.

Small circular mirrors enclosed in cheap metal coverings, including outer cases for closing the same, are dutiable as toys, under para. 418 of the Tariff, at the rate of 35 per cent. *ad val.* Similar mirrors set in tin frames, with backs adapted for holding an advertisement, are dutiable as mirrors, under para. 112, at the rate of 45 per cent. *ad val.*

Braids, etc., composed of cotton or other vegetable fibre and other materials, including such as are known as "Battenberg braids," "crown braids," "feather-stitch braids," "feather-edge braids," "guipure lace braids," "herringbone braids," "Honiton braids," "linen bobbins," "novelty braids," "renaissance braids," "rickrack braids," "star braids," "wave braids," etc., are dutiable under para. 339 of the Tariff at the rate of 60 per cent. *ad val.*

TRANSPORT AND FREIGHTS.

The Freight Market.—Outwards the position remains practically unchanged, but rates are weak at 3d. to 6d. reduction in most directions. Recent fixtures have been on basis of 5s. 9d. Genoa, 6s. 6d. Adriatic, 5s. 9d. Port Said, 6s. 6d. Las Palmas, 9s. 6d. Colombo, 11s. 6d. Buenos Ayres, 12s. 6d. Rio Americano.—The only feature has been a slight demand for grain tonnage, but otherwise there is no change in the situation. **Australian** shippers, owing to the sudden rise in the local value of wheat, are paying vessels large sums to discharge cargo already loaded and cancel their charters. **Black Sea** has been operating at 7s. 6d. Odessa berth. **Eastern** markets have declined, and current quotations are 12s. 6d. Bombay, 20s. Calcutta, 20s. Rangoon. Java began to operate at 25s., but rate has fallen to 22s. 6d. **Mediterranean** markets continue extremely dull. **River Plate** is still overloaded with tonnage, and rate is weak at 9s. from Buenos Ayres, or 12s. up-river. One or two suitable boats have secured cattle to South Africa.—WEDDEL, TURNER & CO., April 25, 1902.

COLONIES.

Canadian Northern Railway.—The Canadian Northern Railway Charter has passed the Dominion House of Commons. By it the Company is authorised to extend its line through the North-West Territory to British Columbia, north of the Canadian Pacific Railway line, *via* Pine River Pass, with bonding powers of \$25,000 per mile, and also to build eastwards to Quebec.

New Steamship Service to South Africa.—A new steamship service is about to be established between Liverpool and South African ports. It will be undertaken conjointly by two well-known Liverpool shipping companies. Messrs. T. and J. Harrison have arranged, in conjunction with Mr. J. R. Ellerman, of the Leyland line, to have regular sailings every twelve days to the Cape, the starting-point on this side being Liverpool. This additional service will not result in the reduction of freights, a friendly arrangement having been come to between the promoters of the new venture and the Clan Line, who already have regular sailings between Liverpool and South and East African ports. The question of the insufficient steamship communication between the Mersey and South Africa has recently occupied the attention of the Liverpool Chamber of Commerce. The Clan Line were approached, but they replied that there was already sufficient tonnage on the route for the cargo offering.

West Indies.—PRACTICAL SYMPATHY WITH SUGAR PLANTERS.—Messrs. Elder, Dempster, and Co. issued the following statement on the 2nd April:—

"We are very anxious to show our sympathies with the planters of the West Indies and to cultivate trade between Kingston and this country. We have, therefore, issued a circular to-day saying we are willing to carry sugar until further notice free of freight by the Imperial Direct West India Mail service from Kingston to Avonmouth."

BRISTOL AND IMPORTS FROM THE WEST INDIES.—The Bristol City Council have adopted a policy of protection in revising the sugar dues, exempting imports from the British West Indies from the increases which were resolved upon. They advanced the dues on raw sugar from 6d. to 1s. per ton, and refined sugar from 1s. to 1s. 6d. The Council agreed with the recommendation of the Docks Committee that it was inexpedient at the present juncture to alter the charges on sugars from the West Indies, seeing that Sir Alfred Jones, of Elder, Dempster and Co., had announced that liners are about to carry sugar from Jamaica to Bristol freight-free until further notice, in order to give an impetus to Jamaican trade.

FOREIGN COUNTRIES.

France.—TRADE IN EASTERN ASIA.—The French Shipping Company, known as the Société des Vapeurs de Charge is about to change its title to Compagnie Est-Asiatique. It has just purchased a Danish steamer of 8,000 tons register (the *Annam*), and is having three more boats built for the Chinese and Cochin-China coasting trade. This Company contemplates creating a regular steamship service between Copenhagen, Antwerp, Dunkirk, Marseilles, Singapore, Port Arthur, and Vladivostok.

Mexico.—VERA CRUZ HARBOUR.—The new harbour works at Vera Cruz were inaugurated with great ceremony on the 6th March by the President of the Mexican Republic, the Governors of several of the States, and representatives of many foreign Powers. Vera Cruz has hitherto suffered from the great drawback of not affording shelter for vessels in the winter season against the northerly storms which rage in the Gulf of Mexico, and which are familiarly termed "northerners." When one of these storms arose the only chance of safety for ships in the harbour was to instantly seek the open ocean. It may be remembered that during one of these "northerners" in 1851 thirteen vessels came to grief in Vera Cruz harbour. At that time, also, there were no proper facilities for landing cargo, and goods and

passengers had to be put on shore by means of either lighters or boats. It was not until 1882 that any serious efforts were made to remedy this state of things, but even then the work of improvement only proceeded in a very half-hearted manner, until, in 1895, S. Pearson & Son, Limited, of London, took up the contract for completing the harbour works which had been planned, and then the operations commenced in earnest. The improvements are now completed at a cost of thirty million pesos, and these, it is claimed, have changed Vera Cruz into the safest and most commodious harbour in the Gulf of Mexico; offering a secure shelter at all times for vessels of any size, even during the prevalence of the dreaded "northerners."

The works which have accomplished this welcome change consist, in the first place, of two substantial breakwaters, one on the north-east side and one on the south-east side of the harbour entrance—1,823 and 913 metres in length respectively—leaving an opening at the sea ends 260 metres in width. Behind the north-east breakwater a dam 50 metres in length is built, reaching to the Castle of San Juan de Ulua, and two other sheltering dams or dykes—500 and 635 metres in length respectively—having a quay-width of 10 metres, have been formed to provide an anchorage ground for small craft. The great City Quay is nearly two miles long, and stretches from the front of the north-east breakwater to the north side of the south sheltering dam. The piers for ocean vessels run out at right angles from the City Quay, and are numbered from 1 to 12. The Government pier is 180 metres long and 22½ metres wide. There is also another quay 380 metres in length and 100 in width. Connected with this last-mentioned quay are eight railway lines, and here also are four warehouses and a number of electric and hydraulic cranes. Seven large vessels can lie at this quay at the same time, and take or discharge their cargoes direct from or into the railway trucks. The depth of water alongside is 10 metres at ebb tide. For the passenger traffic a special station is set apart on the City Quay, alongside which steamers can lie, and here is also a Custom-house for the examination of passengers' luggage and an office for the quarantine officials. Trains run direct from this pier into the town and to the railway stations. Altogether the new works just completed have made of Vera Cruz a safe and commodious harbour, fitted with the most approved modern appliances.—*Fairplay*.

Russia.—The Russian Government has concluded a contract with the East Chinese Railway Company for the maintenance by this Company, for a period of ten years, of a regular steamship service between Vladivostok and the Sea of Ochotsk. Four voyages must be effected every year, and the first boat must leave Vladivostok after the opening of navigation not later than the 23rd May. Several ports have to be called at in these voyages.

OFFICIAL AND COMMERCIAL CONTRACTS. UNITED KINGDOM.

Biggleswade.—TENDERS are invited until the 30th inst. for CONSTRUCTING A WELL. Particulars (£2. 2s.) may be obtained from G. F. Deacon, 16, Great George-street, Westminster, or from the Clerk to the Water Board, Biggleswade.

Burton-on-Trent.—TENDERS are invited by the Corporation for reconstructing bridge, Horninglow-road, over Trent and Mersey canal: (1) BRICKWORK; (2) STEELWORK. "Fair wages" clause. Particulars, £1 deposit, from Mr. G. T. Lynam, borough engineer, till the 5th inst.

London.—TENDERS are invited, until the 13th inst., by the WEST HAM CORPORATION, for:—Two STEEL CHIMNEYS, four FANS and ENGINES for INDUCED DRAUGHT, all brickwork in connection with flues, and economisers (one contract). "Fair wages" clause. Particulars (£5 B.E. note deposit) may be obtained from Mr. J. K. Bock, borough electrical engineer, Abbey Mills, West Ham, E.

Rochester.—TENDERS are invited by the Corporation, until the 15th inst., for the supply of c.i. pipes. Supply of 2,875 lin. yds. c.i. SOCKET PIPES, 20 SLUICE VALVES, and 15 HYDRANTS. Forms and specifications may be obtained from Mr. W. Banks, A.M.I.C.E., city surveyor, Guildhall, Rochester.

Selkirk.—TENDERS are invited by the TOWN COUNCIL for the supply and laying of about 1,900 lin. yds. of 9-in. c.i. MAINS (Acme i.r. joints), partly under water, with valves, etc. Also INTAKE WORKS, Howden Haugh (tank and collecting gallery). Particulars (£1. 1s. deposit) may be obtained from Mr. H. Taylor, A.M.I.C.E., St. Nicholas' chambers, Newcastle-on-Tyne; or Mr. J. Pretty, C.E., burgh surveyor.

COLONIES.

Ceylon.—TENDERS are invited by the Ceylon Government until the 14th July for the following SUPPLIES OF PAPER:—

- | | |
|--|--------|
| 1. Azure Wove Writing Paper— | Reams. |
| Quad Foolscap, 34 in. by 27 in., 55 lb. | 1,500 |
| 2. Cartridge Paper— | |
| White, Super Royal, 27½ in. by 20½ in., 50 lb. | 150 |
| 3. White Printings— | |
| i. Quad Foolscap, 34 in. by 27 in., 40 lb. | 900 |
| ii. Double Royal, 40 in. by 25 in., 44 lb. | 800 |
| iii. Gazette (special size), 35 in. by 25 in., 43 lb. | 750 |
| iv. Quad Crown, 40 in. by 30 in., 65 lb. | 400 |
| v. Double Royal, 40 in. by 25 in., 60 lb. | 50 |
| vi. Double Demy, 35 in. by 22½ in., 48 lb. | 100 |
| 4. Coloured Printings— | |
| Royal, 25 in. by 20 in., 24 lb. (Yellow 50, Blue 40, Pink 25, Green 5, Slate 5). | 125 |
| 5. Glazed Badami— | |
| i. Double Royal, 40 in. by 25 in., 32 lb., put up folded | 1,000 |
| ii. Quad Foolscap, 34 in. by 27 in., 30 lb., put up folded | 200 |
| 6. Brown Wrapping Paper— | |
| Size 29 in. by 22 in., 50 lb., put up folded | 100 |

Particulars are published in the Ceylon Government Gazette, which may be seen at the Imperial Institute.

New South Wales.—TENDERS are invited until the 5th June, for the SUPPLY of 10,000 feet of STEEL TROUGHING. Particulars may be seen at the office of the Commissioner and Principal Engineer for Roads and Bridges, Sydney, New South Wales.

South Australia.—Contractors accustomed to the execution of large marine works are notified that TENDERS will be invited at an early date for works involved in the CONSTRUCTION of an OUTER HARBOUR in Light's Passage at the entrance to the Port Adelaide River. The proposed works will comprise, approximately, 4½ million cubic yards of dredging in limestone, sand and clay, and the construction of 1,500 feet of wharfs and stone revetment walls in connection therewith for the berthing of steamships in the harbour, also the reclamation of a large area of foreshore with the dredged materials. Drawings and specifications are in course of preparation, and it is anticipated that these will be ready for exhibition to tenderers in Adelaide about the middle of April, 1902, and at the office of the South Australian Agent-General in London about the middle of May,

1902.—TENDERS are invited until the 20th inst., for the SUPPLY and DELIVERY of best IRON CRANE CHAINS, viz.:—5 cwt., short link, 1½ in.; 10 cwt., 1½ in.; 10 cwt., 1½ in.; 15 cwt., 1½ in.; 10 cwt., 1½ in.; 10 cwt., 1½ in.; 5 cwt., 1 in.; 10 cwt., 1½ in. Particulars may be obtained at the Supply and Tender Board Office, Adelaide.

INDIA.

East Indian Railway.—TENDERS are invited, until the 30th inst., for the SUPPLY and DELIVERY of (1) Steel Material, (2) Wrought-iron Material, (3) Spring Steel and Steel Wire, (4) Picks, etc., (5) Canvas, etc., (6) Canvas and Indiarubber Hose and Sheeting, (7) Wrought-iron Gas Tubing, (8) Grindstones. Particulars (Nos. 1 to 7, 21s each; No. 8, 10s. 6d.) may be obtained at the Company's offices, Nicholas-lane, E.C.

State Railways.—The Secretary of State for India in Council invites TENDERS, until the 6th inst., for the SUPPLY of LOCOMOTIVES, 5 ft. 6 ins. gauge. Particulars may be obtained from the Director-General of Stores, India Office, Whitehall.

FOREIGN COUNTRIES.

Belgium.—TENDERS are invited, until the 13th inst., by the National Company of Local Railways, at No. 14, Rue de la Science, Brussels, for the construction of the section of the line from Itegem to Santhoven. The upset price of the work is 206,012 francs (£8,240), and a deposit of 20,000 francs (£800) is required. Particulars (1 franc = 10d.) may be seen at the Company's office, and at the office of M. de Masy, No. 17, Rue Milis, Antwerp.

Netherlands.—The Government invite TENDERS, until the 7th inst., for the supply of the following material:—CONTRACT No. 294.—109 sets of wheels and axles for railway carriages. 295, 296, 297.—Springs and other appurtenances for railway carriages. 298.—35 frames with 3 axles, Cleminson system, for railway carriages. 300.—Various appurtenances for railway carriages. 301.—Ironwork for tanks, cranes, etc. LXII.—Mild steel. Particulars may be obtained from Mr. Mat. Nyhoff at the Hague, on payment of 1 fl. (1s. 8d.) for each of the contracts Nos. 294, 295, 296, 297, and LXII.; 3 fls. (5s.) for No. 301; 4 fls. (6s. 8d.) for Nos. 298 and 300.

Norway.—TENDERS are invited, until the 6th inst., for the supply of 1,550 metres "Moquette" stuff for railway carriage seat covering, and 1,380 metres curtain woollen stuff, of various qualities. Particulars may be obtained at the office of the Director, Engineering Department, Christiania.—TENDERS are invited by the Aalesund Municipality, until the 20th inst., for (1) about 16,000 metres 8-in. cast-iron pipes tested to a pressure of 520 lb. per square inch, except about 2,000 metres which are guaranteed tested to only half that pressure. (2) About 350 metres 9-in. cast-iron pipes, tested to 280 lb. (3) About 1,800 metres 5-in. cast-iron pipes, of which 800 metres tested to 460 lb., and the rest to 280 lb. (4) About 20 8-in. stop valves. (5) Three irregular castings, such as basin lids ("kummelaag"), branch boxes, bends, branches, etc. (6) About 20,000 kilogs. soft block lead—sample block to be sent. Particulars may be obtained from J. S. Solem, town engineer, Aalesund, Norway.—TENDERS are invited until the 12th inst. for the SUPPLY of 6,000 RIFLE STOCK PIECES OF WALNUT to the Kongsberg Arms Factory.—TENDERS are invited until the 13th inst., for the SUPPLY of 80 TRUCK TARPULINS. Particulars may be seen at the offices of the Director of the Engineering Department of the State Railways in Christiania.

Portuguese West Africa.—TENDERS are invited, until the 19th inst., for the CONSTRUCTION of a METAL PIER, to be used as a quay in the harbour of Sao Thomé.

Spain.—TENDERS are invited until the 26th inst., for the SUPPLY of 108,000 reams of WHITE PAPER of the second class, known as "de tina." Particulars may be seen at the "Direccion General del Timbre del Estado," Madrid.

COMMERCIAL LAW INTELLIGENCE.

A Point in Insurance Law.—In the Court of Appeal the case of the BRITISH WORKMAN'S AND GENERAL ASSURANCE CO., LTD. v. CUNLIFFE was considered on a special case stated by the justices of Leigh, Lancashire, and the question was whether the respondent Cunliffe could recover from the appellants £5. 16s., premiums which he had paid in respect of the life of his brother-in-law. The policy was effected through one Bibby, formerly an agent of the appellants. The justices found that the life on which the policy had been issued was one in which Cunliffe, who was a collier working at Leigh, had no insurable interest, but that the company, through Bibby, had represented that the policy would be valid and effective in law, and that the respondent relied on the representation, and was entitled to the return of the premiums. The Divisional Court upheld the decision of the justices, and the company appealed to this Court. At the conclusion of the arguments, Lord Justice Vaughan Williams said he was clearly of opinion that the money paid by Cunliffe under the circumstances could not be allowed to remain in the appellants' hands. Bibby had represented to Cunliffe that it would be "all right," and that representation, though an innocent one, was made by a man skilled in insurance matters to a person who was wholly ignorant of law, and naturally believed the truth of the statement. The appeal therefore failed. Lords Justices Romer and Mathew concurred, and the appeal was accordingly dismissed with costs.

Trade Union Law.—Mr. Justice Walton gave judgment at the Glamorganshire Assizes at Cardiff in the case of GIBLAN v. THE AMALGAMATED LABOURERS' UNION of Great Britain. The plaintiff sued Mr. Williams, general secretary of the union, and Mr. Toomey, the district secretary, for damages, in that they had "unlawfully and maliciously conspired and procured his employers to break their contracts, and to discharge him from their employment, and further that they had induced certain workmen to refuse to work with him, and to threaten to leave their employment if he continued to do so." The trade union, under the Taff Vale decision in the House of Lords, was joined as a defendant. The jury awarded the plaintiff £100 damages. The point of law reserved was as to whether the acts of Williams and Toomey rendered the funds of the union liable. It may be pointed out that this is the first case in which a trade union has been sued in a court of law. Mr. Justice Walton, in giving judgment, said a trade union was a collective name for a number of persons acting by certain persons in concert. It was not a corporation, but a body of individuals who had agreed to act in concert for the attainment of specific objects, which were defined by its rules. The action by which the plaintiff was injured was either that of the union, acting in concert through its authorised agent, or the action of Williams and Toomey. Assuming that the union was responsible for the acts of its co-defendants, the members of the union, acting in concert through their agents, prevented plaintiff from obtaining employment by refusing to work for employers who employed him. Having regard to previous decisions, he did not think this would be an actionable wrong if it were done for the

purpose of protecting or advancing the interests of the union. On the other hand, having regard to the case of *Quin v. Leathan*, it would be actionable if done directly for the purpose of injuring the plaintiff. Applying this principle to the present case, it seemed that the union secretary's object was to punish the plaintiff for not repaying the money he had misappropriated. If Williams did this within the limits of his authority as secretary, there would be judgment for the plaintiff against the union and the two other defendants. But the question was whether Williams was acting within the limits of his authority. If he committed a tort in doing something not within his authority at all, even though he purported to be acting for the union, his act could not be deemed to be an act by the members of the union. After considering the rules of the union, he (the judge) held that Williams had done something outside the limits of his authority, and therefore the union was not liable. There would, therefore, be judgment against Williams, and for the union and the defendant Toomey.

Shipping.—The frequent question of when a ship has arrived in a port arose in the case of *MODESTO PINIERO & Co. v. DUPRE & Co.* The plaintiffs were the owners of the s.s. *San Salvador* and let her to the defendants by a charter-party dated November 3, 1900, to proceed to Santander to a loading-place as ordered, and there load a cargo of iron ore and proceed to Maryport and there unload. The *San Salvador* arrived at Santander on November 18, 1900, and was ordered by the defendants to the new tip, five miles up, where she did not arrive until December 6, 1900. The plaintiffs brought this action for demurrage, claiming that the lay-days began on November 18, 1900. The defendants, on the other hand, contended that the lay-days did not begin until December 7, 1900, when the ship was ready at the loading-place to which she was ordered by them. Mr. Justice Kennedy gave judgment for the defendants, and said that in his opinion the ship was not an arrived ship until she reached the loading-place to which she was ordered in the port of Santander. The charter-party did not order her to go to Santander only, but to a loading-place as ordered in that port.

Railways and Traders.—An important decision was given by the Court of Appeal on s. 76 of the Railways Clauses Act, 1845, in the case of *THE LANCASHIRE BRICK AND TERRACOTTA COMPANY (BAXENDEN), LTD., v. THE LANCASHIRE AND YORKSHIRE RAILWAY COMPANY.* That section provides that owners of land adjoining railways and any other persons may lay down collateral branches to communicate with railways, and obliges the railway companies at the expense of such persons to make openings in their rails to effect such communication, but such openings need not be made where they would interfere with any specific purpose of the company, nor on any inclined plane or bridge, nor in any tunnel. A later section, s. 92, allows anyone to use the lines with properly constructed engines and carriages. The applicants, the Lancashire Brick, etc., Company, carried on business near Baxenden station and had an agreement made in 1894 with the railway company which provided for the laying down of sidings by the railway company. This agreement contained a clause limiting the right of user of the sidings to the applicants. Afterwards the applicants let part of their land to a chemical manufacturer, who used the sidings for his traffic. The railway company then gave notice determining the agreement, and removed the connections. The applicants then applied to the Railway Commissioners (Mr. Justice Wright, Sir P. Peel and Lord Cottenham), under s. 76 of the Railway Clauses Act, 1845, for an order upon the railway company to make a connection and sidings and afford reasonable facilities for traffic. The Railway Commissioners gave judgment in favour of the applicants. The railway company then appealed to the Court of Appeal, and contended that s. 76 had no real operation now because it was impossible for persons other than themselves to use the line. They also argued that a gradient of 1 in 98 where the connection was asked for, constituted an "inclined plane" within the meaning of s. 76. The Court of Appeal reversed the decision of the Railway Commissioners, and the Master of the Rolls said that the applicants had not the right claimed; s. 76 was passed when a railway was considered to be a form of highway.

BRITISH CONSULAR REPORTS.

Holland (Amsterdam).—The Consular report on the trade and navigation of the port of Amsterdam for the year 1901, states that business, on the whole, has been less profitable and satisfactory than in 1900. The shadow of the war in South Africa has hung over all minds, and there has been a general disinclination to engage in large operations. Moreover, the increasing tendency of all trades towards co-operation and syndication has not encouraged individual enterprise, and the whole course of commerce and industry there, as elsewhere, is gradually adopting new channels. The labouring classes were, on the whole, much less restless than in the previous year, and there have been but few strikes of any importance. Up to the commencement of the winter there was no great complaint of want of employment, but for some weeks before the close of the year there has been an increase in the number of the unemployed, and the outlook at present is not entirely satisfactory. On the other hand, there has been hitherto no exceptional distress, and employment in many branches of industry has been well sustained.

Shipping, in common with this branch of trade in all other countries, has suffered from a severe reaction in the course of the past year, and is still in a very depressed state. Dear coal and greatly reduced freights have brought profits down to a minimum for the most favoured lines, while many vessels, especially those of the adventuring class, are being run at a loss. There is a great scarcity of goods for transport, and the very large steamers which have been constructed of late find a difficulty in filling up with cargo, and this naturally leads to great depression in rates of freight. The Baltic timber trade, in which many Dutch vessels find employment, has especially suffered in this respect, and a diminution of in some instances 30 to 40 per cent. in rates has not been uncommon. Nor are the prospects for the ensuing year at present by any means encouraging, though the cost of coal has fallen already to a normal figure, good coal being now obtainable at 16s. 6d. to 17s. free in bunkers. As regards the shipbuilding and generally the iron manufacturing industries of this country, the past year was busy and fairly prosperous. Several steamers were built in this country for the Netherlands commercial fleet, and a still larger number are under construction, while considerable orders have been entrusted to British builders. In the iron industry the demand for machinery from several quarters has been increasing, and the prospects for the present year are encouraging in many respects. The construction of electrical machinery of all sorts, and that of electrical rail and tramways, and of the required rolling-stock, will give a new spur to this branch of industry. Existing horse tramways are being rapidly converted into electrically worked lines, and the necessary buildings and machinery for the supply of this motive-power are being pushed forward in many places. Automobiles, propelled by electric-power, steam, or petroleum, have

not as yet been introduced into the Netherlands to so considerable an extent as in neighbouring countries, but there is a gradually increasing demand.

Portugal (Lisbon).—WINE TRADE.—The latest report issued by the Foreign Office from the British Attaché at Lisbon states that the wine trade in Portugal is passing through a period of serious depression, owing to the super-abundant production and the large stocks of wine that cannot be placed on the market. Although many enquiries are received about various classes of cheap light wines suitable for ordinary use in England, little progress has been made in bringing them to the knowledge of the public. To place a new class of wine on the market requires considerable enterprise, and might be undertaken by well-known firms who can supply their regular customers with samples for trial. If this were done, and the prejudice against unknown articles of consumption were overcome, there can be no doubt that these light wines would have a ready sale in England. The manufacture of good cheap wine in Portugal has only been seriously undertaken during the last few years, so that it is quite natural that it should be still unknown outside the country. Portugal is admirably suited to the growth of vines, so the production of wine is always out of all proportion to the demand. Up to 1886, the Portuguese wines, with the exception of port wine and Madeira, were only used to supply the requirements of the country and for export to the Portuguese colonies, Brazil, and to the French wine factories. The wine was manufactured of the finest grapes, but mixed with inferior potato alcohol, without technical knowledge, without proper apparatus or cellars for storage, and under the necessity of immediate sale in order to pay the expenses of the vintage. It was natural that there was no demand among consumers in Europe for this class of wine.

Of recent years, however, the production of good sound wine of the nature of claret and hock is rapidly increasing, and now that care is taken in its manufacture, the flavour and quality are excellent, and the wine is in many ways superior to other wines to be obtained at the price. The increase in this trade is much to be wished for by both countries, as it would supply an article of necessity in the United Kingdom to the benefit of the consumer and merchants, and would encourage a new and important trade between the two countries which would create a favourable influence on general business relations. The total annual exportation of port wine has declined during the last six years, but still amounts to 275,314 hectolitres, valued at 5,739 contos of reis (£889,500).

In spite of the rivalry among wine-producing countries, the prospects of the port wine trade in the United Kingdom are as good as ever. Although habits have changed as regards wine drinking, the taste for port wine has spread through all classes of the population, and instead of only being drunk by well-to-do people, there is now a large sale of port wine at bars and restaurants. Although it is feared that much of this cheap port wine does not come from Oporto, this new class of consumer will largely compensate the port wine trade for any loss of former customers, and while the choicest wines can be reserved for good cellars, the cheaper quality will meet with an increasing demand. The port wine trade has been such a valuable support to British industry in Portugal during the last century that it would be a serious loss to British trade in general if the wine should decline in popular favour. The Madeira wine trade does not show any great fluctuations, and has somewhat increased of late years. The output is limited, and the trade can never be very important. The United Kingdom, Russia, France, and Germany are the best customers. The numberless foreign wines of the same description as Madeira tend to reduce the prices, but the best qualities still command high prices, and are as much in demand as ever.

United States (Charleston).—In a recent report on the trade of Charleston and district for the year 1901, it is stated that probably no portion of this country has attracted wider attention or the investment of more outside capital, during the past year, than has that section south of the Pennsylvania line and east of the Ohio and Rio Grande rivers. The development there of its mineral resources has been large, with greatly increased operations in prospect for the future, and it is difficult for one not in touch with the business to form a just idea of what has actually been done last season or is now in course of preparation. No State in the Union is more favoured by nature in the extent and diversity of its mineral products than is West Virginia. Her coal deposits embrace all grades of bituminous, coking, steam and gas coal of the best qualities. West Virginia contains more of the Appalachian coalfield than any other Southern State. The total area comprises about 16,000 square miles, more than 80 per cent. of the total bituminous areas of Ohio and Pennsylvania combined, 60 per cent. more than Pennsylvania alone, and 2,000 square miles more than Tennessee and Kentucky combined, the section underlain by coal being about two-thirds of the area of the State. The total product of the Virginia mines was about 25,000,000 tons last year, compared with 22,647,207 tons in the previous year. After West Virginia the greatest coal State in the South is Alabama, the output of which for 1901 is estimated by the coal inspector to be 10,000,000 tons net, as compared with 8,400,000 tons during the previous year. The Alabama coal business is divided into three distinct branches, namely, the production of coal for coke-making and industrial use at or near the point of production; the supply of coal for locomotive use throughout the country; and also the supply of coal for domestic use and steam-making purposes in communities that are situated near the mines.

The production of coal in the State of Tennessee has increased from 2,092,064 short tons in 1892 to 4,200,000 tons in 1901, a considerable portion of the product having been mined by convict labour in mines owned and worked by the State. In the mining districts many new enterprises are being developed and much new work, it is expected, will be done next year. Coal-mining in North Georgia has been carried on to a limited extent, comparatively speaking, for a number of years, principally by convict labour, the convicts being hired from the State; the Georgia output is very generally used for domestic and steam-making purposes, for which it is well adapted, but high railway rates have restricted its distribution to a limited extent of territory; experiments are, however, being made at Savannah by the New York coast steamers, with the view of ascertaining if Georgia coal cannot be profitably used for bunker purposes by ships from the first-named port. No exact figures have yet been obtainable as to the output of coal in either Georgia or North Carolina during the past year; the quantity, however, is somewhat limited in character in both States. Kentucky is a large coal producer, the tonnage having increased from 3,025,313 tons in 1892 to 5,000,000 tons in 1901. Maryland's product is about the same as the State of Kentucky, her output having increased from 3,419,962 tons in 1890 to 5,000,000 tons in 1901. Arkansas is also coming forward as a coal State; her product in 1901 was 1,447,945 tons, while the estimate for last year is 1,750,000 tons. An interesting feature of last year's reports has been the growth of the coal-mining industry as a consequence of railway extensions in West Virginia, Kentucky, Tennessee and Arkansas, and also of canal work done and improved terminal facilities at Mobile, Pensacola, New Orleans, Savannah, Newport News, and Norfolk.

FOREIGN CONSULAR REPORTS.

Commerce of Mexico.—The City of Mexico is the capital of the country and the commercial centre; being the railroad centre, it is the distributing point for the rest of the Republic; being the banking centre, the bulk of the financial transactions of the Republic pass through it. Much of the agricultural and mining business, and some of the manufacturing business of the rest of the Republic, are directed from this city. The most important single line of trade, and that which shows the largest amount of imports, is in machinery and machinery supplies. This is practically controlled by Americans. The hardware trade, which is a good one, is largely in the hands of Germans, though in the past few years American hardware has been making deep inroads into the German imports in this line. While the large hardware stores are run by Germans, all of them now carry large lines of American hardware. The dry-goods trade, which is next in importance after the machinery trade, was controlled early in the last century by the English and later by the Germans, but it is now controlled by the French. The grocery trade is controlled by Spaniards, and their monopoly of this line is almost absolute. There appears to be no large field for imports of American groceries in Mexico, the demand being mostly from resident American and a few Mexicans who have lived for some time in the United States. The figures for the year ending June 30, 1901, show a very unsatisfactory year's business for Mexico. Imports increased over the preceding fiscal year \$3,765,275, or 5·8 per cent., while the total exports show a slight falling off. A glance at the export figures, however, shows a decline of \$7,395,186 in vegetable substances, and an increase of \$7,047,419 in mineral substances. Most of this increase is due to the exportation of gold and silver bullion, which is a net loss to the nation's resources. Thus the actual decrease in exports amounts to nearly \$14,000,000. Encouragement is to be found in the falling off of certain imports, such as dry-goods, indicating an enlarged home supply. While imports from the United States show a large increase, those from almost every other country exporting to Mexico—except Germany—show a large decline. Imports from the United States gained \$4,138,838, or 11·8 per cent., while the total increase in imports amounted to only \$3,765,275, or 5·8 per cent. In other words, while the imports from the United States show an increase of \$4,138,838, the imports from the rest of the world show a decrease of \$373,562. Imports from the United States amounted to 54·3 per cent. of the total imports, as compared with 50·6 per cent. in the preceding year.

IMPORTS FROM GREAT BRITAIN show a decrease of \$558,565, or 5·3 per cent., from the preceding fiscal year. It is known that the greatest falling off in any one line is in dry goods, particularly cotton textiles. The value of cotton textiles imported from Great Britain during the year may be roughly estimated at \$1,200,000, as compared with \$2,100,000 during the preceding year, a decrease of nearly one-half. Importations of railway iron and steel for the last fiscal year amounted to about one-third of those during the preceding year, or, roughly, about \$188,000 as compared with \$585,000. Importations of galvanized fell from about \$490,000 in the fiscal year 1899-1900 to about \$290,000 in the fiscal year 1900-1901. Importations of linen textiles fell from some \$190,000 in the fiscal year 1899-1900 to \$135,000 during the fiscal year 1900-1901. In cotton textiles a remarkable falling off is noted in prints and bleached cottons. The decrease in importations of cotton and linen textiles from Great Britain during the past few years is due in great part to the rise of native cotton and linen manufacturing industries.

The East Indian Papaya.—The papaya tree flourishes all over tropical India, from Delhi to Ceylon. Its fruit is greatly prized by both European and native, as well for its edible as for its medicinal qualities. Botanically, it is of the passion flower family, and is termed *Carica papaya*. The tree grows very quickly, and bears fruit within a year from first putting down the seed. It bears fruit all the year round, and in great numbers. It seems to thrive best in a hot, moist climate. The fruit, when ripe, attains to the size of a small melon, which it somewhat resembles. While growing, it has a deep green colour, which, on ripening, turns to a dull orange. The interior is soft, yellowish, and sweet, and contains numerous small black seeds, arranged in five longitudinal lines along the centre cavity. They have a pleasant, pungent taste, and are not unlike mustard seed. The ripe fruit has a flavour peculiar to itself. It is eaten by all classes, and is considered wholesome. In the West Indies it is sometimes boiled and eaten as a vegetable. In India, when green, it is cooked by the natives in their curries, and is also pickled. It is usually, however, eaten raw, when ripe, with salt, and is ranked among the finest of eastern fruits.

CHEMICAL AND MEDICINAL QUALITIES.

The properties of the tree to which particular attention is drawn are its remarkable chemical and medicinal qualities. Many of them are known to the profession in America, but they are more especially known to the native Hindoo, who, in his unique village life, has extracted from the vegetable kingdom many of its valuable secrets.

THE JUICE.

The fruit, particularly in the early stages, secretes a white, milky, viscid juice, of the consistency of cream, which has the extraordinary property of hastening the decay of muscular fibre exposed to its influence. It has an energetic action upon nitrogenous substances, and, like pepsin, will curdle milk. It is more efficacious than pepsin in dissolving albumen.

PAPAIN.

The active principle has been separated and given the name of papain, and is used for medical purposes. This active principle, so analogous to pepsin in its physiological properties, may be obtained by adding alcohol to the juice of the unripe fruit, which causes a precipitate, which, when dried and powdered, is ready for use, and called papain. The whole tree abounds in this juice, which is remarkable as containing fibrine, a principle otherwise found only in the animal kingdom. The celebrated chemist Vanqueline compares this creamy juice to blood deprived of its colouring matter. The resemblance between this juice and blood is indeed striking. In its peptonizing power it is superior to ordinary animal pepsin, having the peculiar additional advantage of not requiring the aid of an acid nor an alkali to convert the contents of the stomach into peptone.

CHEMICAL PROPERTIES.

Tough or fresh meat of any kind dipped in water containing a few drops of the juice, or boiled in water impregnated with the juice, will become in a few minutes quite tender. A simple way to prepare meat is to wrap it in the leaves of the papaya and then roast it. In a tropical climate like India meat requires to be cooked quickly, in order to prevent rapid decomposition, and consequently is usually found tough.

COSMETIC.

The juice is used as a cosmetic to destroy freckles on the skin caused by the sun's heat, and to remove ink stains from the hands. The fruit and juice have several other medical properties that have long been recognised by the Hindoo pundit, and lately have been receiving the attention of chemists and the medical profession.—*United States Consular Report.*

CHAMBERS OF COMMERCE REPORTS.

UNITED KINGDOM.

Leeds.—At the monthly meeting of the Leeds Chamber, held on 25th March, the chair being taken by the president (Mr. G. R. Portway), correspondence was submitted from the Butter Association with reference to the fixing of a standard of moisture in butter. The Board of Agriculture had fixed a limit for water in butter, but had exempted milk-blended butter, and thus, it was alleged, the door was left open to fraud. Mr. Ward said that if liquid were put into butter it was, to a certain extent, a fraud upon the public. The admixture of milk was an addition of water, because the principal constituent of milk was water. A resolution was passed condemning the sale of milk-blended butter, and urging the Board of Agriculture to fix a standard of moisture for butter, which would apply to milk blending.

A long letter was read from the China League respecting the changes proposed to be made in the import duties on goods entering China, and the promise made that, in compensation for an increase of some 15 per cent. on the import duties, the internal taxation on merchandise should be abolished. The consistent bad faith of the Chinese Government, and the rooted antipathy of successive British Governments to intervention on behalf of their nation in China, were important facts in considering the matter. It might be postulated with some degree of certainty that the policy of the Chinese officials would remain in the future pretty much what it had been in the past, and while the system of government remained what it was in China there was no reason to suppose that the exemption of foreign goods from an illegal taxation would be any more effectually secured under the new treaty than under the old, unless material guarantees were secured. Alderman Wurtzburg thought that in the interests of British trade with China support should be given to the action which the China League was taking in the matter. Mr. Matheson said that even if China got the extra duties she would not abandon the Likin duties, because the central Government had not sufficient control over the Mandarins to bring about such a reform. Mr. Henry Barran agreed that it would be impossible for the Chinese Government to carry out any such reforms at present, at any rate in an enduring form. It was decided to support the China League in the matter.

Mr. F. W. Tannett-Walker, who was one of the deputations from the Association of Chambers of Commerce to the Postmaster-General on the subject of the telegraph system, made a report as to the proceedings. He said that there was an idea that an underground line should be taken to Scotland *via* Preston, but he was able to extract an assurance from Lord Londonderry that the line should go through Leeds. He thought the Department had made up its mind to construct an underground line, and that the work would be quietly pressed forward irrespective of whether the Chancellor of the Exchequer could or could not afford to give large doles from the public purse towards this work.

Liverpool.—At a recent meeting of the committee of the African Trade Section, Sir Alfred Jones, K.C.M.G., chairman of the section, presiding, it was reported that the memorial of the Chamber on the subject of the concessions in the French Congo had been circulated to certain Chambers of Commerce abroad, whose assistance in the matter had been invited. The Bremen Chamber of Commerce had now replied, saying they thought that a meeting of the signatory powers to the Berlin Act of 1885 should be summoned to consider how the terms of the Act had been complied with. The committee expressed themselves strongly in favour of the suggestion, and recommended that the proposal of the Bremen Chamber should be brought to the notice of Lord Lansdowne. The following letter has accordingly been sent to his lordship:—

"My lord,—I am directed to draw your lordship's attention to the memorial on the above-named subject, addressed to you by this Chamber on the 30th September, 1901, and especially to the last paragraph thereof, in which it is urged that immediate steps may be taken to enforce the Act of Berlin of 1885, if the above-named concessions are found to be an infringement of that Act.

"I am to inform you that this Chamber has been in communication with several Continental Chambers of Commerce on the subject, and that the Bremen Chamber has suggested to the German Government that the signatories to the Act of Berlin should be re-assembled in conference to consider the manner in which the terms of the Act have been observed. I am to say that the committee of the African Trade Section strongly approves of the suggestion, and trusts that your lordship and His Majesty's Government will give it their support.—I have, etc. (Signed) THOMAS H. BARKER, Sec.

The following statement was laid before the committee by a member of the section:—"It may interest the West African Committee to know that we have recently received a report from Cape Coast that the judges are declining to issue certificates of validity in respect of dredging concessions over the beds of rivers, and, as we understand it, this applies whether the rivers are tidal or non-tidal. In declining to issue certificates they refer the matter to the Government, the inference being that the chiefs who have purported to grant concessions have no right to do so, but that the title over beds of rivers is in reality in the Government. Under English law, except where there has been a royal grant, the bed of a tidal river does not belong to private individuals, but where it is non-tidal the owners of the land on either side have full rights over the bed to the middle of the stream. It seems clear that the chiefs from time immemorial exercised seigniorial rights over the beds of rivers.

"From a purely legal point of view it appears to us that it is an interference with the native rights; on the other hand, we think there can be no doubt, from a practical standpoint, that it would be beneficial for the Government to take over the titles, and we assume that they would compensate the chiefs by giving them a certain proportion of the rent."

It was resolved to bring the matter before the notice of the Secretary of State for the Colonies, and to ask him whether the information given in the foregoing statement is correct.

Sir Alfred Jones announced that Mr. Chamberlain had recommended the Governor of Lagos to abolish the dues charged there on goods in transit to Porto Novo, and that the dues in question would be abolished accordingly. The committee expressed much gratification with the statement of the chairman, and wrote to thank Mr. Chamberlain for his action in the matter.

After the meeting, the sub-committee appointed to consider the Forestry Proclamation, Southern Nigeria, presented their report thereon, which was concluded and adopted.

Manchester.—An ordinary meeting of the Board of Directors of the Chamber of Commerce was held on the 9th ult., Mr. John Thomson (president) occupying the chair.

Since the last meeting of the Board, steps have been taken to ascertain the opinion of the general body of the Bombay merchants in Manchester as to certain proposed regulations for the settlement of questions arising out of the occurrence of "short length" white piece-goods. A series of resolutions on the subject, adopted by a meeting of these merchants, and afterwards revised by the India, China, and Colonial Committee, was presented in the minutes of that Committee. The Committee requested that the Bombay Chamber should be asked to

present the regulations for the acceptance of the Bombay Native Piece-Goods Merchants' Association. These read as follows:—

(1) If the number of short pieces over and above pattern-cut pieces does not exceed 10 per cent. of the total number of pieces in any one lot of bleached mulls, jaconets, nainsooks, or tanjibs, delivery shall be accepted with an allowance, in respect of shortage over and above pattern-cut pieces, calculated at the rate of the sale price. (2) If the number of short-length pieces over and above pattern-cut pieces exceeds 10 per cent. of the total number of pieces in any one lot of bleached mulls, jaconets, nainsooks, or tanjibs, the dealer shall have the option of returning the excess over the 10 per cent. short in such lot. (3) If the number of short-length pieces over and above pattern-cut pieces does not exceed 15 per cent. of the total number of pieces in any one lot of bleached shirtings, delivery shall be accepted with an allowance in respect of shortage over and above pattern-cut pieces calculated at the rate of the sale price. (4) If the total number of short-length pieces over and above pattern-cut pieces exceeds 15 per cent. of the total number of pieces in any one lot of bleached shirtings, the dealer shall have the option of returning the excess over 15 per cent. short in such lot. The word "lot" is defined as meaning those goods or that instalment of goods which, in the terms of the contract, are to be shipped or delivered in any one specified period. The Board adopted the regulations, and ordered that a letter should be addressed to the Bombay Chamber, as desired by the India Committee.

A letter received from the Imperial Department of Agriculture for the West Indies (Barbadoes), accompanied by six samples of cotton grown in that island, was laid before the Board. The samples were of various kinds, five of them having been grown from American seed. The Department asked to be informed of the value of the cottons. It was stated that much interest is being taken in cotton cultivation in several of the West Indian Islands, and that many experiments are in course of progress. Information was desired as to the advisability of endeavouring to promote the commercial cultivation of cotton in the West Indies. It was resolved to submit the samples and the letter to the Committee recently appointed at the instance of the Oldham Chamber, to consider the question of the extension of the growth of cotton.

GENERAL INTELLIGENCE OF THE PAST MONTH.

April, 1902.

UNITED KINGDOM.

APRIL 1st: The King visited the Royal National Hospital for Consumption at Ventnor. The Lord Mayor entertained the boys of Christ's Hospital at the Mansion House. Death of General W. C. Forrest, C.B.

2nd: The King, accompanied by the Princess Henry of Battenberg and her children, visited Carisbrook Castle. The Prince and Princess of Wales left London for Copenhagen. The sixth meeting of the National Directory of the United Irish League was held in Dublin.

3rd: At a special meeting of the Dublin Corporation, Mr. J. Redmond, M.P., and Mr. P. A. McHugh, M.P., were presented with the honorary freedom of the City. The King left Cowes for Weymouth and visited Lulworth Castle.

4th: The King inspected the Convict Prison at Portland. A conference of tenant farmers was held in Belfast to consider the new Land Bill.

5th: The King visited Plymouth. Death of Major-General Sir John Donnelly, R.E., late Secretary, Science and Art Department, South Kensington. Euston Hall, the seat of the Earl of Grafton, was destroyed by fire. Death of Professor Meiklejohn. A serious disaster occurred at a football match at Glasgow; one of the stands collapsed and 23 persons were killed.

7th: The King visited the Scilly Isles. In the House of Commons the Licensing Bill passed the second reading.

8th: Death of Lord Kimberley in his 77th year. The Queen Victoria Memorial Fund amounted to £192,000.

9th: The King visited Penzance. In the House of Commons the Rating of Machinery Bill was read a second time. A company was formed with a capital of £5,000,000 for the purpose of electrifying the District Railway, and building and working four other underground lines.

10th: The King visited Falmouth. A memorial service was held in St. Paul's for the late Mr. Cecil Rhodes. The Irish Unionist Alliance held its annual meeting in Dublin.

11th: The King returned to Cowes. A meeting was held at the Mansion House to further the development of commercial relations between Russia and Great Britain. It was announced that 21,000 more men would be sent to South Africa. Death of Viscountess Chewton.

12th: The King returned to Buckingham Palace. Rumours of peace were in circulation. Sir E. Lawson laid the foundation stone of the new Institute of Journalists.

14th: Lord Stratheona presented to the King an address from the citizens of Montreal with a gold medal commemorating the visit of the Prince and Princess of Wales. Death of the Rev. Dr. Caleb Scott. In the House of Commons the Chancellor of the Exchequer made the Budget statement, placing duties on corn and flour.

15th: A serious accident occurred on board the battleship *Mars*. A national conference of Evangelical Free Church Councils was held to protest against the Education Bill. Death of Sir E. T. Gourley.

16th: The King left Buckingham Palace for Sandringham. Nine counties of the South and West of Ireland were proclaimed.

17th: The Prince and Princess of Wales returned to London from Denmark. Lord G. Hamilton spoke at the annual dinner of the Institution of Mechanical Engineers. In the House of Lords the second reading of the Music Copyright Bill was passed.

18th: Princess Louise, Duchess of Argyll, opened the annual exhibition of the Royal Drawing Society. In the House of Commons, the Post Office Vote was carried.

19th: Primrose day was observed in London. The French Chamber of Commerce in London held their annual banquet.

21st: The King received the Crown Prince of Siam at Buckingham Palace. The Archbishop of Canterbury presided at the annual meeting of the Church of England Temperance Society. The Lord Mayor opened the Guildhall Art Gallery Exhibition.

22nd: The King was present at the Epsom Spring Meeting. The Queen arrived in London from Denmark. The Duke of Argyll opened a British Empire Missionary Exhibition at Kensington Town Hall. In the House of Commons the corn and flour duties were adopted.

24th: The Archbishop of Canterbury presided at the annual meeting of the Society for the Propagation of the Gospel in Foreign Parts. The Alien Immigration Commission held its first sitting in Westminster.

25th: Mr. Brodrick was presented with the honorary freedom of the Broderers' Company. Lord Charles Bressford was returned unopposed as M.P. for Woolwich, and Mr. Hugh Law (N.) as M.P. for Donegal West.

26th: The King and other members of the Royal Family witnessed the Lacrosse Match at Lord's between the Toronto Club and the Duke of Argyll's team. Lord Alverstone presided at the annual dinner of the Newspaper Press Fund.

28th: The Archbishop of Canterbury presided at the annual meeting of the National Temperance League.

29th: The King left London for Newmarket. Nonconformist meetings were held in opposition to the new Education Bill.

COLONIES.

Australia.—5th: A general order was issued for raising four new battalions for South Africa, to be named the Australian Commonwealth Horse.—10th: The second reading of the Franchise Bill providing for Women's Suffrage was passed by the Commonwealth Senate. 24th: The Commonwealth adopted the principle of Imperial Penny Postage.—**New South Wales.**—19th: A banquet was given to Mr. Seddon, at Sydney.—**Victoria.**—3rd: Mr. McCulloch, Minister of Public Works, was deputed to organise the Agent-General's Office in London.—9th: Reform meetings were held to insist on reduction in the expenditure on Parliament and the public service.—**South Australia.**—2nd: The 2nd contingent for South Africa embarked.

New Zealand.—5th: The Government decided to enrol the Maoris as volunteers.—8th: Mr. Seddon was presented with a purse of £5,000 and an address in recognition of his Imperial services.—14th: Mr. Seddon left for Durban, along with 500 men of the contingent for South Africa.

British West Africa.—6th: The Aro campaign was concluded, and the contingents from Lagos and Northern Nigeria returned to their own colonies.

Canada.—3rd: The Manitoba Act, restricting the sale of liquor, was defeated by a very large majority.—8th: Lord Dundonald was appointed to the command of the Canadian Militia in succession to Major-General O'Grady Haly. The extension of the charter of the Canadian Northern Railway was approved by the Parliamentary Railway Committee.—9th: The Canadian Pacific Railway purchased the Ottawa Northern and Western Railway for \$4,500,000.—10th: Mr. Borden announced that the active militia forces would be increased to 100,000 men.—28th: The fourth contingent of 2,000 men for South Africa was completed.

Cape Colony.—1st: Colonel F. Rhodes and Mr. A. Rhodes arrived at Cape Town.—3rd: The funeral service for the late Mr. Cecil Rhodes was held at Cape Town; the coffin was conveyed by train to Rhodesia. Mr. Rhodes left in his will £2,000,000 for educational purposes and his residence, Groot Schuur as an official house for the Federal Premier.—4th: The Parliament was prorogued till August 1.—7th: Commandant Kritzing was acquitted.—9th: Skirmishes with scattered band of Boers and local rebels were reported.—28th: The trial of Princess Radziwill for forgery was begun in the Supreme Court, at Cape Town.

Fiji.—9th: Sir H. M. Jackson, Governor of the Leeward and Island, was appointed Governor and Commander-in-Chief.

Jamaica.—2nd: The Government abandoned its new taxation plan, as part of the community refused to pay.—4th: Rioting occurred at Montego Bay. Troops and a cruiser were sent to suppress the rioters.

Leeward Islands.—9th: Sir G. Strickland, Chief Secretary at Malta, was appointed Governor.

Natal.—1st: The northern districts were strongly protected by blockhouses; a portion of the troops from India were sent up country.—15th: A Bill was introduced into Parliament creating a burgher force and establishing universal compulsory service.—23rd: The Burgher Bill was withdrawn.

Newfoundland.—15th: The Premier announced that he had secured the entry of Newfoundland fish into Portugal on the same terms as Norwegian fish.

Rhodesia.—8th: The train conveying the remains of Mr. Cecil Rhodes arrived at Bulawayo.—10th: The body of the late Mr. C. Rhodes was interred in the Matoppos.—24th: It was reported that Mr. R. Williams had been granted a concession for a railway from the northern frontier of Rhodesia to Lake Kasali, Congo Free State.

Orange River Colony.—8th: De Wet's brother, Piet de Wet, was authorised to raise another burgher corps for the Colony.

Transvaal.—1st: The Boers under Delarey and Kemp were utterly routed near the Hast River and dispersed; the Canadian Rifles greatly distinguished themselves.—2nd: The Boer delegates succeeded in communicating with Mr. Steyn.—6th: It was reported that Caspar Kruger had taken the oath of allegiance. The total number of Boers in the field was estimated at 8,000.—7th: Lord Kitchener reported that Commandant Erasmus had been killed near Boshof.—9th: The Boer leaders held a conference with Mr. Schalk Burger, Mr. Reitz, and the other peace delegates at Klerksdorp. Increasing numbers of native labourers arrived on the Rand.—12th: The members of the Boer Transvaal "Government," with Generals Botha, Delarey, and De Wet and Mr. Steyn, arrived in Pretoria.—13th: Colonel Colenbrander captured the greater portion of Beyer's laager.—18th: The Boer delegates and leaders left Pretoria to confer with the burghers in the field as to terms of peace.—22nd: Mr. Reitz and Mr. Jacobs left Balmoral for Pietersburg to meet Commandant Beyers.

INDIA.

3rd: The number of persons on famine relief was reported to be 395,000.—5th: An agreement was made for the preservation of order among the Mahsud tribesmen.—8th: News was received that a party of Punjabi rifles had been ambushed by a gang of outlaws near Joi Khula.—15th: The number on famine relief was 359,000.—17th: The question of the Berars was settled, the Nizam relinquishing all territorial claims, and receiving thirty lakhs annually in lieu of surplus revenues.—19th: Lord Curzon arrived at Delhi to inspect sites and plans in connection with the Coronation Durbar in January next.—26th: Lord Curzon held a durbar of chiefs and representatives of the North-West Frontier Province of Peshawar, and explained the policy of the Government towards the frontier tribes.

FOREIGN COUNTRIES.

Argentine Republic.—2nd: The Government decided to purchase two additional warships at a cost of £2,000,000.—13th: The Government accepted the tender of the Creusot Company to build a harbour at Rosario at a cost of 53,000,000 fr.—**Austria-Hungary.**—9th: Count von Bülow arrived in Vienna.

Belgium.—9th: Socialist disturbances took place in Brussels, Liège, and Ghent; troops were called to arms.—10th: The Socialists demanded universal suffrage. The rioting increased.—12th: Further riots were reported in Brussels.—14th: A general strike of workers commenced.—23rd: Work throughout the country was resumed.

Chili.—9th: The Chambers were opened.

China.—1st: Russia agreed to withdraw from Manchuria within eight months.—4th: The Chinese internal postal system

was greatly improved.—8th: The amended Manchurian Convention was signed at Peking.—12th: The allied commanders resolved that the Provisional Government of Tien-tsin should be maintained until the forts were destroyed. The rebellion in Kwang-si continued to make head.—14th: Prince Tsai-chen, son of Prince Ching, was appointed special ambassador to King Edward's Coronation.—29th: The Emperor, the Empress Dowager and the Court returned to Peking. The agreement for restoring to China the Peking-Shan-hai-kwan railway was signed.

Denmark.—8th: King Christian's 84th birthday was celebrated.—19th: The Landsting passed a resolution that the sale of the Danish West Indies should not take place unless the electorate of the islands voted for it.

France.—6th: M. Clémenceau was elected to the additional senatorship devolving on Var by the death of M. Denormandie.—7th: Mr. Doumer, the retiring Governor-General of French Indo-China, arrived at Marseilles.—28th: The general elections resulted in a great success for the Ministry.

Germany.—2nd: It was announced that the German Emperor would be represented at King Edward's Coronation by Prince Henry of Prussia. Dr. Kuyper, the Dutch premier, arrived in Berlin.—19th: Death of Prince Henry XXII. of Reuss.

Holland.—18th: It was announced that the Queen was ill with typhoid fever.—23rd: The Queen was reported to be recovering.—28th: The Queen continued to make satisfactory progress towards convalescence.

Italy.—2nd: The 11th International Peace Congress was opened at Monaco.

Norway.—16th: The Ministry resigned.—20th: A new Cabinet was formed by M. Blehr, who will hold the portfolio of the Interior and the Premiership.

Persia.—5th: It was reported that a concession to work the oil beds of the Kirkhah had been granted to a British subject.

Philippines.—13th: Major Waller was acquitted of the charge of killing natives of Samar.

Russia.—4th: The new Four per cent. Loan was subscribed for more than 100 times over in Germany, Holland, and Russia.

—10th: The Roman Catholic Archbishop of Vilna was deprived of his see.—15th: M. Spiaguine, Minister of the Interior, was assassinated.—22nd: General Vannovsky, Minister of Education, resigned.—24th: It was reported that the population of Finland offered great resistance to the new army regulations.

Serbia.—5th: The peace footing of the Serbian Army was raised to 17,500 men. Dr. Popovitch, Minister of Finance, resigned.—6th: M. Milanovitch became Financial Minister in addition to holding the provisional charge of the Department of Commerce.

Spain.—5th: The Bank of Spain protested against the Bill relating to the fiduciary circulation.—17th: Death of Don Francisco d'Assisi, ex-King of Spain.

Switzerland.—1st: The new palace of the Swiss Parliament was opened at Berne.—10th: Diplomatic relations with Italy were suspended.

Turkey.—12th: Bulgarian bands continued to commit outrages in Macedonia. Fresh troubles were reported in Albania.—22nd: The Arab rebellion in Yemen was reported to be spreading.

United States.—5th: It was announced that the New York Chamber of Commerce would invite the Prince of Wales to attend the ceremony of dedicating the Chamber's new building in August next.—11th: The death of General Wade Hampton was announced.—13th: Death of the Rev. Dr. de Witt Talmage in Washington.

Venezuela.—8th: News was received that the Government forces had severely defeated the revolutionists twice.—18th: Diplomatic relations with France were renewed.—24th: A Government force was reported to have been defeated by the revolutionists near San Antonio, and General Castillo killed.

FORTHCOMING EVENTS.

UNITED KINGDOM.

Kingston-on-Thames.—On the 17th inst. the millenary of the Coronation of Edward the Elder will be celebrated.

London.—On the 7th inst. Mr. Albert Chancellor, J.P., as Master of the Coachmakers' Company, will read a paper at the Society of Arts on "The Origin and History of Carriages." On the same date the annual meeting of the Iron and Steel Institute of Great Britain opens. Institution of Civil Engineers, Westminster (two days).—On the 8th the annual dinner of the JAPAN SOCIETY will be held, the Japanese minister in the chair.—On the 9th the PRINCE OF WALES will be installed as Chancellor of the University of Wales, at Bangor.—On the 12th the KING will hold a LEVÉE at St. James's Palace at noon.—On the 14th the annual general meeting and the annual dinner of the NAVY LEAGUE will be held.—On the 22nd the King and Queen will be present at the opening of the Royal Military Tournament at Islington.—On the 28th Sir Robert Herbert presides at the annual dinner of the Colonial Club.—On the 30th the KING'S BIRTHDAY will be celebrated, and the usual ministerial banquets held.—June 4th is DERBY DAY.

FOREIGN COUNTRIES.

Austria (Prague).—An AGRICULTURAL EXHIBITION is to be held at Prague, under the auspices of the Bohemian Central Agricultural Society, from the 15th to the 19th inst. The exhibition will comprise agricultural machines and implements, foodstuffs, etc.

Germany (Wannsee).—An INTERNATIONAL MOTOR-BOAT EXHIBITION is to be opened on 1st June, at Wannsee, a watering-place on the River Havel, near Berlin. The exhibits will include the construction, care and use of boats, launches, yachts and other craft of moderate tonnage propelled by gas, gasoline, electric or steam motors. The enterprise is under the auspices of the Middle European Motor-Carriage Association, No. 1, Universitäts-Strasse, Berlin.

Mexico.—PROPOSED PERMANENT EXHIBITION.—The United States Consul at Vera Cruz reports that the project of establishing a permanent exhibition of foreign and native products in the City of Mexico, which has been under consideration for some time, is likely soon to be an established fact. A contract has been signed between the Department of Public Improvement, on the part of the Mexican Government, and Mr. Jose Landero Cos, representing a company, by which a concession is granted to the latter to establish a permanent exhibition as above mentioned. The agreement has already been approved by the Lower House of Congress, and it is hoped it will meet the approval of the Senate. According to this agreement, the buildings for the exhibition shall be finished within three years, and cost not less than \$300,000 in Mexican currency. The concession is for a term of ten years. The administration of the exhibition will promulgate its rules and regulations, approved by the Government, in Spanish, English, French, Italian, and German. An annual catalogue will also be published in the same languages, containing a descriptive list of all the articles exhibited. Any article to be received for exhibition must be accompanied by a ticket, stating the name of the manufacturer or producer, or his agent, the name of

the article, its application, price, and all other necessary data. Enough space in each building shall be reserved for Federal Government exhibits. In order to assure the success of the exhibition, the Government of the Republic asks the different States of the Federation to obtain articles and data, and such other information as will help to extend commercial relations. All material necessary for the construction of the buildings, as well as samples of foreign products, will be admitted free of duty, under a bond guaranteeing that they are for the use of the exhibition only. However, any samples so imported which have not been sold or re-exported within one year will be assessed the usual duties according to the tariff in force at the time of importation.

Peru (Lima).—The Peruvian Consul at Southampton announces an EXHIBITION to be open in Lima for 30 days from the 1st September next, of ARTICLES AND APPARATUS connected with the USE OF ALCOHOL in the PRODUCTION OF MOTIVE POWER, HEAT AND LIGHT. The Consul states that he is prepared to receive catalogues and other information from the manufacturers of such apparatus who may be desirous of exhibiting their goods at the Lima exhibition. Further particulars will be communicated to all intending exhibitors.

NAVAL AND MILITARY INTELLIGENCE.

NAVAL.

Captain John R. Jellicoe, C.B., R.N., has been appointed Naval Assistant to the Controller of the Navy.

It is understood that Captain J. A. Tuke will be appointed Master of the Fleet at the forthcoming Naval Review.

The *Encounter*, second-class cruiser, will be launched at Devonport on June 18. She was laid down on January 28, 1901.

The cruiser *Ariadne* has been ordered to commission on June 5 for service as flagship on the North America and West Indies Station.

The battleship *Repulse* completed her refit and equipment at Sheerness on the 5th ult., and left for the Mediterranean for temporary service there before rejoining the Channel Squadron.

The *Aboukir*, armoured cruiser, was commissioned at Portsmouth by Captain C. J. Graves-Sawle for service on the Mediterranean Station.

The Admiralty have placed orders for two new battleships, one with the Fairfield Company and the other with Messrs. Vickers, Sons and Maxim.

The *Fawn*, torpedo-boat-destroyer, has been commissioned at Portsmouth for service with the Mediterranean Squadron by Lieut.-Commander R. W. Myburgh.

The *Doris*, cruiser, will, about May 6, be commissioned at Devonport by the crew of the *Arrogant*, cruiser, Captain H. C. B. Hulbert, for service with the Channel Squadron.

The *Icarus*, sloop, Commander G. F. S. Knowling, which has been relieved on the Pacific Station by the *Sharwater*, sloop, Commander C. H. Umfreville, is expected at Plymouth on May 11. She will pay off at Chatham.

The *Syren*, torpedo-boat-destroyer, was commissioned at Portsmouth by Lieut. and Commander the Hon. H. Maude and the crew of the *Teaser*, the *Syren* taking the place of the *Teaser* in the instructional flotilla.

Captain Robert S. Lowry, who was Rear-Admiral Lord Charles Beresford's Flag Captain during the whole of the time his lordship was second in command of the Mediterranean, takes over the command of H.M.S. *Howd* on the 1st inst.

The new battleship *Vengeance* was commissioned at Portsmouth on the 8th ult., for service in the Mediterranean, where she will be a valuable addition to our fleet. The *Vengeance* is the last to be completed of the *Canopus* class.

The new battleship *London*, which is named for the Prince of Wales to fly his Royal Highness's flag at the Coronation Review, will shortly after that ceremony be sent to the Mediterranean as Rear-Admiral Burges Watson's flagship, and relieve the *Royal Sovereign*.

Captain Christopher G. F. Maurice Cradock, who has just been appointed Flag Captain to Rear-Admiral Sir Baldwin Wake Walker, Bart., of the Reserve Squadron, was promoted to the rank of Commander while serving in the Royal yacht *Victoria and Albert* in August, 1896.

The *Camperdown*, battleship, Captain H. A. W. Onslow, which arrived at Spithead from Lough Swilly on the 4th ult., was taken into Portsmouth Harbour to carry out her annual repairs, which are expected to detain her at Portsmouth for some months.

The *Devastation*, battleship, Captain F. G. Kirby, which has been relieved on the Mediterranean Station by the *Irresistible*, battleship, Captain G. M. Henderson, as guardship at Gibraltar, arrived at Plymouth and was paid off at Devonport.

The *Seagull*, torpedo-gunboat, which was the first ship in the service to be fitted with the Niclausse water-tube boiler, has been completely overhauled, and is now placed at the disposal of the Boiler Committee, who will next week attend some experimental runs in her.

The new Bermuda floating dock, built by Messrs. Swan and Hunter, Limited, of Wallsend, is ordered to leave the Tyne on May 15 for Sheerness, where the *Sans Pareil*, battleship, Captain A. J. Pocklington, port guardship, will be docked to test the working of the structure before it is towed across the Atlantic to Bermuda.

The *Gossamer*, torpedo-gunboat, has arrived at Sheerness from the works of Palmer's Shipbuilding Company, Jarrow-on-Tyne, where she has been fitted with new engines and water-tube boilers. Her new machinery is to indicate 6,000 horse-power, being 2,500 horse-power in excess of the power of her former engines and her speed is expected to be increased from 19 knots to 21 knots.

According to present arrangements, Admiral Sir John Fisher will transfer the command of the Mediterranean Squadron to Admiral Sir C. E. Donville on June 4, and it is, therefore, not improbable that Sir J. Fisher will bring home his flagship, the *Renown*, in time to fly his flag at the naval review. As the *Ariadne*, cruiser, is to be commissioned at Portsmouth early in June as flagship of Vice-Admiral A. L. Douglas on the North American and West Indies Station, it is probable that that flagship will also appear in the lines at Spithead.

The first of the submarines, launched at Barrow some months ago, was further severely tested on the 4th ult. Seven persons, including Admiralty and other officials, were sealed up in the vessel, and she was several times run the length of Buccleuch docks. During each trip she was rapidly and suddenly submerged a great many times, the vessel meanwhile being kept in a straight course. The submerging, which was merely a foot or so below the surface, took only some six or seven seconds, very little more time being required to bring her to the surface again.

France.—The new French Squadron which is to be maintained in the Far East, in accordance with the recent Ministerial decision, will be made up as follows:—First Division.—The armoured cruiser, *Montcalm*, Vice-Admiral Marechal's flagship; the fast cruisers, *Guichen*, *Châteaurenault*, and *De la Gravière*; and the protected cruisers, *Friand* and *Bugeaud*. Second Division.—The fast cruiser, *D'Entrecasteaux*, flagship of Rear-

Admiral Bayle; and the protected cruisers, *Pascal*, *Sfax*, *Catinat*, *Infernet*, and *D'Estrées*.

The *France Militaire* states that the submersible *Silure* has been making some interesting experiments outside the harbour at Cherbourg. Among other things it sank to a depth of 134 ft., at which it was found that the hull was compressed to the extent of 1-25th of an inch (1mm.). No inconvenience was felt by the crew greater than that experienced at a depth of from 20 ft. to 25 ft.

Germany.—*Ueberall* publishes full details of the German cruiser *Frauenlob*, which was launched at the Weser Yards, Bremen, on March 22. She has been known hitherto as small cruiser "G." Her length between perpendiculars is 328 ft.; beam, 39 ft. 4 in.; displacement when drawing 16½ ft. of water, 2,700 tons; engines, 8,000 horse-power; speed, 22 knots; bunker capacity, 600 tons; radius of action at moderate speed, 6,000 miles. Her two propellers are three bladed and made of bronze. Her boilers are of the Thornycroft-Schultz type. Her armour deck runs the whole length of the vessel, and the coal is stowed so as to serve as a further protection. She carries 12 145 in. guns, 12 machine-guns, and two submerged torpedo tubes. Two powerful dynamos supply the electricity for two search-lights, for the general lighting, and for the motive power of the hoists, ventilators, pumps, capstans, steering gear, etc.

A new German cruiser, to be known at present as the *Ersatz Kaiser*, has been laid down recently at the Imperial Yards, Kiel, where the *Fürst Bismarck* and *Prinz Heinrich* were built; and where the *Prinz Adalbert* is being finished. A fifth cruiser, the *Ersatz König Wilhelm*, is building by Blom and Voss, at Hamburg. The five cruisers are of much the same type, but the newest vessel will have engines of greater horse-power and a speed which is also greater, of from 22 to 23 knots. She is not to be finished until 1905.

The Germania Yards, Kiel, have in hand a number of torpedo-boats for the German navy. The length is nearly 126 ft.; beam, 22 ft.; and displacement, 350 tons. One recently launched made a *maximum* speed at her trials of 28½ knots in Eckernförde Bay, where the water is shallow. In deeper water she is expected to add another knot to her speed. The boat bears the number G 108.

United States.—The Naval Committee of the House of Representatives have decided to recommend the building of two battleships of 16,000 tons each, two armoured cruisers of 14,500 tons, and two gunboats of 1,000 tons. The battleships will be the largest ever authorized for the American navy.

MILITARY.

Captain C. G. Pritchard, Royal Garrison Artillery, has been appointed Commandant of the Hong Kong Volunteers.

Major-General Sir Leslie Rundle is to take over the command of the South-Eastern District this month.

Major Cecil Daniel, 1st Royal Scots, has been appointed Governor of the new Military Prison at Woking.

Lieut.-Colonel the Hon. H. Lawrence, 17th Lancers, has vacated his appointment on the Intelligence Staff, in order to take over the command of 17th Lancers in South Africa.

Colonel Belfield, Royal Munster Fusiliers, formerly Assistant-Adjutant-General at Aldershot, has been appointed Acting Inspector-General of the Imperial Yeomanry in South Africa.

Lieut.-Colonel J. Stock, 2nd Battalion Essex Regiment, has been selected to succeed Colonel W. Wood in command of the 44th Regimental District at Warley.

Major E. M. Percival, D.S.O., Royal Artillery, has been appointed to command the 1st Battalion Imperial Yeomanry in South Africa, with the temporary rank of Lieut.-Colonel.

Major W. V. Dickinson, second in command of the 2nd Battalion Welsh Regiment, has been selected to succeed Lieut.-Colonel Penno in command of the regiment.

Major T. McCulloch, Royal Army Medical Corps, has been appointed Deputy Assistant Director Army Medical Service at headquarters, in succession to Major W. G. Macpherson.

Colonel E. A. W. S. Grove, C.B., has been selected to succeed Colonel F. B. J. Jerrard as chief on the staff of the General commanding the Scottish District, Edinburgh.

Captain Younghusband, 19th Bengal Lancers, has been appointed second in command of the 26th Battalion Imperial Yeomanry for service in South Africa.

Major H. H. L. Malcolm, D.S.O., second in command of the 1st Battalion Cameron Highlanders, has been selected to succeed Colonel J. M. Hunt in command of the 2nd Battalion.

Major-General Lord Dundonald has been appointed to command the Canadian Militia in succession to Major-General O'Grady Haly.

Captain Matthews, Royal Monmouthshire Engineer Militia, who has been serving in South Africa, has left for India, to take up the appointment of aide-de-camp to Lord Amthill, Governor of Madras.

The King has been pleased to approve that the Army Temperance Association and the Army Temperance Association of India shall in future be conjointly styled the "Royal Army Temperance Association."

Major A. E. Simpson, at present second in command of the 3rd Battalion Manchester Regiment, stationed at North Camp, Aldershot, has been selected to succeed Lieut.-Colonel A. E. R. Curran in command of the 1st Battalion.

Major-General Parr, C.B., is to succeed Major-General Swaine in the command of the North-Western District at Chester. Major-General Parr has been in charge of the South-Eastern District during the absence of Sir Leslie Rundle in South Africa.

Colonel S. H. Harrison, King's (Liverpool) Regiment, Commandant of the Petersburg District and Lines of Communication north of Nylstroom, has been appointed to command the Royal Munster Fusiliers (101st) Regimental District at Tralee, succeeding Colonel D. G. Johnston.

Lieut.-Colonel T. Lyons Biggar, Assistant Quartermaster-General for Canada, has joined at Aldershot, by order of the Canadian Government, to study the organisation of the Army Service Corps, a branch of the service now being added to their establishment.

Colonel Waters, C.V.O., has been confirmed in his appointment as Military Attaché to the Embassy at Berlin, and he will hold it until June, 1905. Colonel Waters was temporarily appointed in the place of Colonel Grierson, M.V.O., who had been ordered to South Africa.

The King's Colonials, Imperial Yeomanry, the new County of London Regiment, raised by Lieut.-Colonel Willoughby Wallace, were inspected by Major-General Sir H. Trotter on the Horse Guards' Parade on Sunday the 27th ult. After the inspection the regiment marched to St. George's Church, Hanover-square, and attended a special service at 3.30 p.m.

The King has approved of Major-General W. F. Vetch, now Assistant Director-General of Ordnance on the Headquarters Staff, being appointed a Major-General on the Staff to command the 13th Brigade at Dublin. Major-General Sir G. de C. Morton, now commanding the Dublin District, will in future command the 7th Division.

Colonel R. Auld, now Assistant Quartermaster-General on the Headquarters Staff, is to be appointed Deputy Quartermaster-General, a new appointment, and will be succeeded as Assistant Quartermaster-General by Lieut.-Colonel F. T. Clayton, C.B., Army Service Corps, now at Aldershot, after previous Staff service in South Africa.

IMPERIAL INSTITUTE JOURNAL.

VOL. VIII. No. 90.

LONDON.

JUNE, 1902.

GENERAL NOTICES.

"THE IMPERIAL INSTITUTE JOURNAL."

Fellows resident in the United Kingdom, the Colonies, India, and Foreign Countries, are supplied with the JOURNAL free by post each month.

The Subscription to the JOURNAL from other than Fellows, *both at home and abroad*, is as follows, including Postage, and Posted Monthly:—

Yearly . 8s. 6d. | Half-yearly . 4s. 6d. | Quarterly . 2s. 6d.

Subscribers to the JOURNAL can have it forwarded by post on each day of publication by payment in advance. Post Office Orders or Cheques should be made payable to the Editor, at the Imperial Institute, South Kensington, S.W., to whom also all communications relating to the JOURNAL should be addressed.

The JOURNAL may also be purchased for **Sixpence** each copy at the Ticket Office of the Institute and at the railway book-stalls of Messrs. WILLING & Co.

The City Agents for the JOURNAL are Messrs. WILLING & Co., 17, Royal Exchange, London, E.C. It may also be obtained at the offices of the printers, WATERLOW & SONS LIMITED, Blomfield-house, London-wall, London, E.C.

Communications respecting Advertisements should be addressed to the ADVERTISEMENT MANAGER, 6, Arundel-street, Strand, London, W.C.

This JOURNAL is distributed (by post) throughout the United Kingdom, India, and the Colonies of the British Empire, and to the following Foreign Countries:—Argentine Republic, Austria-Hungary, Belgium, Bolivia, Chili, China, Colombia, Costa Rica, Denmark, Egypt, France, Germany, Greece, Hawaiian Islands, Holland, Italy, Japan, Mexico, Montenegro, Morocco, Norway, Persia, Peru, Portugal, Russia, Siam, Spain, Sweden, Switzerland, Tripoli, Turkey, United States of America, Uruguay, and Venezuela. The JOURNAL is also placed in the Reading Rooms of CHAMBERS OF COMMERCE, CLUBS, and HOTELS, both at home and abroad.

SPECIAL NOTICE.

EXHIBITION OF GIFTS AND ADDRESSES PRESENTED TO THE PRINCE AND PRINCESS OF WALES, DURING THEIR COLONIAL TOUR IN 1901.

His Royal Highness the PRESIDENT of the IMPERIAL INSTITUTE has decided that an EXHIBITION shall be held in the North Gallery of the Institute of the GIFTS and ADDRESSES presented to their Royal Highnesses the PRINCE AND PRINCESS OF WALES on the occasion of their visiting the Colonies in 1901. The Exhibition is open to the Public (Admission 1s.) on week-days, from 11 a.m. to 7 p.m. until further notice. The PRINCE OF WALES has also decided that the proceeds of the Exhibition shall be added to the "CORONATION GIFT" to KING EDWARD'S HOSPITAL FUND.

SPECIAL EXHIBITION OF COLONIAL PRODUCTS AND INDUSTRIES.

A Special Exhibition of Collections illustrative of the Mineral Wealth and of certain Industries of the DOMINION OF CANADA, also of commercial products from QUEENSLAND, RHODESIA, WESTERN AUSTRALIA, and BRITISH NORTH BORNEO, is on view in the western half of the North Gallery, from 11 a.m. to 7 p.m., on week-days—**Admission Free.**

The whole of the Collections at the Institute will be open until 7 p.m. during the continuance of the Exhibition of Gifts and Addresses.

FELLOWS' DEPARTMENT.

The Reading, Writing, and News Rooms, are open for the use of Fellows every week-day from 10 a.m. till 11.30 p.m., and on Sundays from 3 p.m. to 10.30 p.m. The Library (on the First Floor), is open from 10 a.m. to dusk on Week-days, and from 3 p.m. to dusk on Sundays. The Map Room (First Floor) is open from 10 a.m. to 5 p.m. on Week-days.

The Poste Restante is open every week-day for receipt and delivery of letters and parcels. Letters addressed to initials only are not received, except in reply to notices in the JOURNAL, under "Requirements" Registry. The General Post Office Pillar Box is cleared daily twelve times, between 10.10 a.m. and midnight. Light refreshments only are, for the present, provided in the Fellows' Rooms and at the bar of the Ceylon Kiosk.

EMIGRATION INFORMATION OFFICE.

The Office of the British Women's Emigration Association (*see page 162*), in the West Corridor, First Floor, is open daily from 10 a.m. to 4 p.m., and advice and information respecting emigration and openings in the Colonies may be obtained there free of charge. Enquiries of all kinds relating to the Colonies from intending Emigrants are dealt with in the Commercial Intelligence Department, and special information respecting Canada and the Cape Colony may also be obtained from the Curators for these Colonies, on application personally at their offices, or by letter.

SCHOOL OF MODERN ORIENTAL STUDIES.

An "Ouseley" Scholarship of £50 per annum, tenable for two years, will be awarded, should sufficient merit be shown, for proficiency in PERSIAN. No person will be admitted to competition for a Scholarship in a language which is his own mother tongue, nor for a Scholarship in a language allied to his mother tongue. The examination will take place early in July next. Full particulars may be obtained of the Secretary to the School, Imperial Institute. (*For further information see page 160.*)

SCIENTIFIC AND TECHNICAL DEPARTMENT.

The Scientific and Technical Department of the Institute has been established to acquire information by special enquiries and by experimental research, technical trials and commercial valuation regarding new or little known natural or manufactured products of the various Colonies and Dependencies of the British Empire and of foreign countries, and also regarding known products procurable from new sources, and local products of manufacture which it is desired to export. This work is carried out with a view to the creation of new openings in trade, or the promotion of industrial developments.

In the extensive and well-equipped series of Research Laboratories occupying the West Corridor of the Second Floor, a staff of skilled Chemists, under the direction of Professor Wyndham R. Dunstan, M.A., F.R.S., carry out the investigation of the chemical constitution and properties of new dye-stuffs, tanning materials, seeds and food-stuffs, oils, gums and resins, fibres, timbers, medicinal plants and products; animal products, minerals and ores, soils, cements, and various other products, with a view to their commercial utilization. Whenever necessary these materials are submitted to special scientific experts, by whom they are made the subjects of particular investigation or practical tests. Reports are also obtained from technical or trade-experts in regard to the probable commercial or industrial value of any such products, whilst full information is collected from official or other trustworthy sources regarding the probable extent and cost of available supplies. All materials requiring scientific or technical examination, or commercial valuation, should be submitted to the Institute for examination either by, or through, the Foreign Office, the Colonial Office, the India Office, or the Board of Trade, or through the Colonial or Indian Government Authorities. Requests for the examination of such materials may also be submitted by Public Commercial Bodies and Institutions of the respective Colonies and Dependencies, or by the Representatives of H.M. Government in foreign countries.

COMMERCIAL INTELLIGENCE DEPARTMENT.

The Office of this Department, in the West Corridor, First Floor, is open daily from 10 a.m. to 5 p.m. (on Saturdays till 1 p.m.), for the purpose of answering enquiries and supplying information relating to the Commerce (Export and Import) and Industries of India and the Colonies. Applications may be made personally or by letter. Special information may be obtained from the Curators in charge of the Indian and of certain Colonial Collections. Arrangements have been made for the translation for mercantile firms of Trade Circulars, Price-Lists, and Catalogues into any Foreign Language, including the conversion of weights, measures and coinages, etc., at cost price, and application for such may be addressed to this Department.

COMMERCIAL COLLECTIONS.

The Galleries containing the Colonial and Indian Collections, and the Public Commercial and Industrial News Room, are open for free inspection by the public daily, *except Sundays, and any days specially notified*, from 11 a.m. until 7 p.m. Every information concerning the products, their supply, etc., can be obtained on application to the Curators of the Indian and Ceylon, Canadian, and South African Sections, to the general Curator, and to the Commercial Intelligence Department.

CITY BRANCH OF THE IMPERIAL INSTITUTE.

REMOVAL TO 49, EASTCHEAP, E.C.

The City Enquiry Office and Reading Room have been removed from 112, Cannon-street to larger premises at 49, EASTCHEAP, where a commodious apartment is also provided for the display, to merchants, manufacturers, etc., of raw and manufactured products received, from time to time, from the Colonies and from India, and for which it is desired to find openings in British markets. Curators and other members of the Imperial Institute staff will attend at the Office, at stated times and by special appointment, to deal with enquiries and to assist in establishing or facilitating business relations with mercantile houses, etc., in the Colonies and India. The City Branch is in constant communication, by telephone and messengers, with the Imperial Institute, South Kensington. (*For further information see page 160.*)

THE NORTHBROOK SOCIETY.

The Northbrook Society is affiliated to the Imperial Institute, and has a special room allotted for the exclusive use of its members in the Institute buildings. Its primary objects are to watch over and promote the interests of natives of India, and to provide a system of guardianship or supervision over such as are sent to Europe for education. The Society is controlled by a committee consisting of an equal number of Governors of the Imperial Institute and members of the Society, presided over by the Earl of Northbrook. It possesses an excellent library. Indian members, who pay no subscription to the Society, have the especial advantage of becoming Fellows of the Institute at half the usual subscription payable by the ordinary Fellows. Applications for membership of the Society should be addressed to the Secretary of the Northbrook Society, Imperial Institute, London, S.W.

ROYAL BRITISH NURSES' ASSOCIATION.

The Annual General Meeting of this Association will be held in the Imperial Institute on Monday, 16th June, at 12 o'clock noon. Her Royal Highness PRINCESS CHRISTIAN, President of the Association, will preside.

FINANCIAL AND COMMERCIAL RETROSPECT.

UNITED KINGDOM.—According to the Board of Trade returns of the foreign trade for April, the imports, valued at £46,199,928, were £65,689, or 0·1 per cent. less than in the same month of last year. In April, 1901, there were only 24 working days against 26 in last April, but, on the other hand, the figures for last year were abnormally large, owing to the heavy importations of sugar in anticipation of the Budget proposals. In April last there were increases in manufactured articles, miscellaneous articles, metals, raw materials for sundry industries, chemicals, oil and tobacco; but in other classes there were decreases, among them being one of over two millions sterling in the category of food and drink liable to duty, in which of course sugar is included. In meat of all sorts, whether dead or in the form of living animals, there was a general decrease, both as to quantity and value, though it was not quite so pronounced in the latter as in the former. There were smaller shipments both of cattle and sheep and of beef, from the United States. In cereals, wheat, valued at £2,238,441, showed a rise of 5·5 per cent. in quantity, though only 1·4 per cent. in value. Wheat-flour, however, was one-third less in amount, and its value fell from £1,000,643 to £633,151. In oats and Indian corn there was a decrease in quantity of just over 14 per cent. in both cases, but whereas the value of the former increased by 7·6 per cent., that of the latter fell off by 6·6 per cent. Barley improved 5·4 per cent. in amount, and 7·3 per cent. in value. In raw materials for textile manufactures, smaller consignments of raw cotton from the United States reduced the quantity by 21·5 per cent., while the value fell by 23·8 per cent. (£917,268). Cotton manufactures increased in value by 32·8 per cent. Sheep and lambs' wool, however, owing to larger arrivals from Australasia, was 19·2 per cent. higher in quantity, and increased in value by £460,565 (15·4 per cent.) to £3,447,544. Jute, silks, alpaca wool and goats' wool, were more in quantity and value, but flax and hemp were less. In metals, iron ore, pig iron, bar iron and unwrought steel, were all higher in value and quantity, and though copper ore and regulus were lower in both respects, unwrought copper showed a large improvement. Lead and crude zinc were also much higher, and tin gained about the same fractional percentage in value that it lost in quantity. Wood, sawn and hewn, was worth £1,073,040, the value having decreased by 2·8 per cent., although the quantity increased 5·6 per cent. The exports of British and Irish produce were valued at £23,492,529, an increase of £1,505,496, or 6·8 per cent., being thus shown; the increase is spread over every class of articles except raw materials, metals, and new ships. Coal, although 0·2 per cent. greater in amount, decreased in value by 9·5 per cent. to £2,200,133. Iron and steel were 14·8 per cent. greater in quantity, and 16·4 per cent. in value. Machinery rose in value by 7·1 per cent. to £1,655,067. Cotton yarn was 1·2 per cent. less in value, though 11·0 per cent. greater in quantity, but cotton piece-goods rose 16·2 per cent. in the latter respect, and 10·7 per cent. in the former, to a total value of £4,882,896, the larger shipments being mainly to China. Other cotton manufactures increased by £75,457. Woollen and worsted yarn increased 14 per cent. in quantity and 6·6 per cent. in value, while in both woollen and worsted tissues there were substantial improvements, the increase in quantity being 10·0 per cent. and 13·9 per cent. respectively, and in value 9·2 per cent. and 5·3 per cent. In chemicals, soda compounds rose in value by 27·8 per cent. to £116,611, but the improvement in quantity was still larger, viz. :—34·5 per cent.; chemical manures fractionally declined in amount, but their value was 25·2 per cent. greater. The re-exports of colonial and foreign merchandise were valued at £6,673,949, an increase of £387,942 as compared with April, 1901.

Lloyd's shipbuilding returns for the first quarter of this year state that on March 31st there were, excluding warships, 431 vessels, of 1,120,344 tons gross, under construction in the United Kingdom. At the same period of last year, the number of vessels was 444, and the gross tonnage 1,303,116. Of the tonnage in hand, 1,000,774 tons are for home account, 30,574 tons are for Germany, 22,300 tons for Austria-Hungary, 20,839 tons for Holland, and 14,020 for France. The total is about 119,000 tons less than that shown by the returns for the previous quarter.

Details were published during the month of the Atlantic Shipping "Combine," which has recently been attracting so much attention. The corporation, organized under the auspices of Messrs. J. P. Morgan & Co., is to be registered according to the laws of the State of New York or other State they may select, and is to have a total capital of \$120,000,000; one-half of this is to be 6 per cent. preferred stock with limited cumulative dividends, and the other half common stock, limited to 10 per cent. dividends so long as there are outstanding any of the £50,000,000 of 4½ per cent. collateral trust debentures which are also to be created, and of which the principal is to be payable in 20 years, the corporation possessing the right to redeem them at any time after five years at 105. The properties to be acquired by the Corporation are 750 fully paid shares of £1,000 each in the White Star Company, including all the ships now being built for it, and the goodwill, assets, etc., of Messrs. Imrie, Ismay & Co., including the position of managers of the White Star Line so far as the White Star Line vendors can dispose of it; all the shares of the Dominion Line, the American Line, and the Atlantic Transport Line, including new ships in course of construction for those lines; and 118,463 ordinary and 58,703 preference shares of the Leyland Line. The valuation of the several properties is, in every case, on the basis of ten times the net profits of the different companies in 1900, subject, however, to certain deductions and

exceptions. There is also a builder's agreement between Messrs. Harland & Wolff, of Belfast, and Messrs. J. P. Morgan, by which the former are bound not to build for shipowners who are not parties to the "Combine," except the Hamburg-American line. In return they are to have all the shipbuilding required by the corporation in this country, although the corporation is at liberty to place orders for ships in the United States if it thinks fit. The arrangement has given rise to a great deal of discussion—much of it necessarily futile in the absence of any detailed knowledge of the plans and policy of the promoters—and while some people regard it as a serious blow to the interests of British shipping on the North Atlantic, others hold that too much stress may be laid on sentimental objections and that, even from the British point of view, the combination presents undeniable advantages. It may be pointed out that the total tonnage passing under the control of the "Combine" seems to be of the order of three-quarters of a million gross tons; this is, undoubtedly, a very large proportion of the tonnage employed on the North Atlantic, although important lines like the Allan, Anchor, and Cunard, appear to stand outside, but it is quite a small fraction of the total tonnage registered in the United Kingdom, and what those should do who object to this Americanization is to cease idle lamentations about lack of patriotism, etc., and set to work to ensure that the residue is worked to the best possible purpose, and that its powers are developed as widely and as energetically as possible.

COLONIES.—The Rand gold output in April is reported as 119,588 oz. of fine gold, worth £502,269, against 104,127 oz. in March. This amount is about one-fourth of the Rand output in the same month of 1899 before the outbreak of war. It is computed that at the present time nearly 2,000 stamps are at work out of a total of about 6,000. The Rhodesian output for April, at 17,559 oz., shows a substantial increase over that for March—16,891 oz.—in spite of reported difficulties from cattle disease. In Western Australia the yield was 159,225 oz., obtained from 142,906 tons of ore, the average yield being thus 1 oz. 2 dwt. 6 grs. per ton. In April of last year the yield was 143,809 oz., the amount extracted per ton being 1 oz. 1 dwt. 18 grs. In Queensland the yield was 67,370 oz., and in Victoria 48,946 oz. In New Zealand, the accounts for the past financial year show that the revenue, which amounted to £6,185,403, exceeded the estimates by £214,070, including the sum of £42,769 recovered on account of war expenditure, and there was a surplus of £279,489. The expenditure, which exceeded the estimates by £2,788, amounted to £5,895,914, exclusive of £19,000 expended in paying off debentures.

The following table shows the variations which have occurred in certain Colonial Government securities during the last three months :—

	26th Mar.	28th April.	28th May.
Canada 3 per cent. . . .	101 - 101½	102½ - 103½	103½ - 104

Southern Mahratta 3½ per cent. .	106-109	106-109	106-109

FOREIGN COUNTRIES.—According to the report of Mr. F. E. Taylor, Statistical Secretary to the Imperial Maritime Customs, the foreign trade of China was greater in 1901 than it has been in any previous year except 1899. The value of the imports in 1901 is given as 262,302,918 Haikwan taels, against 211,070,422 in 1900, while that of the exports was 169,656,757 taels, as compared with 158,096,752 taels. With regard to the two staple exports of China, tea and silk, the former has for years been declining, and in 1901 the amount of black tea exported was smaller than ever recorded before, while there was a serious diminution in the exports of green tea. The silk trade did better, the crops being good and the cocoons of fine quality. Of Chinese imports cotton goods take the first place, and the imports of them in 1901 were valued at 96,651,199 taels, against 73,606,360 taels in the preceding year. Contrary to the tendency of recent years, there was a marked demand for the cheaper qualities, and the cheapness of certain American products enabled them in some cases to oust those of British manufacture, Japanese competition also making itself felt. It is comforting to note that Great Britain is still very far ahead of any other country in the share it secures of Chinese trade. Of the tonnage entering and clearing the Treaty ports in 1901, 54 per cent. was British, Germany coming next with 15½ and Japan with 11¼. All other foreign nations counted for only 5·8 per cent., the Chinese tonnage being 13·3 per cent. If the comparison be made on the basis of the tonnage dues paid, the result is :—Great Britain, 51 per cent.; Germany, 18·5 per cent.; Japan, 11·8 per cent.; all other foreign nations, 14·9 per cent.; and China, 3·8 per cent. The Customs revenue in 1901 largely increased in unison with the increase in trade, and reached the sum of 25,537,547 taels; in 1900, the amount was 22,873,986 taels. In Japan, according to a report by Mr. Lay, Acting Japanese Secretary to H.M. Legation at Tokyo, the imports were worth about 21¼ millions sterling, or nearly three millions less than in 1900, while the exports were valued at about

22 millions, an increase of $3\frac{2}{3}$ millions. So far as the United Kingdom is concerned, the imports fell off by over two millions, and the exports increased by £22,000. The United States obtained the largest share of the total trade—about 11 $\frac{3}{4}$ millions sterling, China followed with over seven millions, Great Britain with 6 $\frac{1}{2}$, Hong Kong and British India with nearly 5 $\frac{1}{2}$ millions each, Germany with £3,427,000, and France with £3,167,000. But if the trade with the whole British Empire be considered, it easily tops the list with nearly 18 millions, supplying about half the total imports and taking nearly a third of the total exports.

Our usual table of exchanges follows:—

AGRICULTURAL RETROSPECT.

UNITED KINGDOM.—Cold weather in the early part of May brought plant-growth practically to a standstill, a severe frost one morning in the middle of the month doing serious harm to both farm and garden crops. Milder weather brought the most serviceable rains we have had this season, which speedily effected an improvement in the appearance of the country, and the month closed with summer sunshine and warmth.

The Board of Agriculture, in exercise of the powers conferred on them by Section 4 of the Sale of Food and Drugs Act, 1899, have made the following regulation:—"Where the proportion of water in a sample of butter exceeds 16 per cent. it shall be presumed, for the purposes of the Sale of Food and Drugs Acts, 1875 to 1899, until the contrary is proved, that the butter is not genuine by reason of the excessive amount of water therein." The regulation extends to Great Britain, and came into force on the 15th May. Mr. Hanbury, in reply to a question from Sir E. Strachey, stated that he was aware of the prejudice done to the makers of genuine butter both in this country and the colonies by the sale, as milk-blended butter, of an article artificially loaded with 25 per cent. of water. The introduction of an authorised standard of butter would, it was hoped, if standards in such cases were to be of any real value, have the effect of preventing such an article being so sold; but should that not prove to be the case, further steps ought, he thought, to be taken without delay to remedy the injustice done to both British and colonial farmers.

At the Cork Exhibition, which was opened on the 1st of last month, a large space in the Industrial Hall and a considerable part of the grounds have been reserved for the Department of Agriculture and Technical Instruction for IRELAND, which has subscribed £4,000 to the general purposes of the exhibition, and is spending a further sum of £7,000 or £8,000 on its own particular share in the enterprise. During its two years of existence the department has done most of its teaching by means of leaflets and lectures. The Cork Exhibition has furnished it with an excellent machinery for supplying a number of useful object-lessons in industries subsidiary to agriculture, in agricultural processes, such as dairying, horticulture and forestry, and in technical instruction. The department's object is to give an exhibition of ideas rather than of products, and it hopes, by means of a series of tours conducted by agricultural and industrial experts, to give workers from all parts of the country a sort of "University extension" course in industry, agriculture, and technical science. The outdoor agricultural exhibits show a working dairy and model farm and school garden, and there are exhibits of the processes of fruit and vegetable drying. This division is intended to illustrate some of the features of intensive culture suitable to Irish conditions. There can be no doubt that, if Mr. Horace Plunkett's scheme proves to be as admirable in execution as it is in conception, the Cork Exhibition will give a notable stimulus to the development of Irish industries.

COLONIES.—The annual report for 1901 of the work of the official experimental farms of the DOMINION OF CANADA testifies to the useful character of the work upon which Dr. Saunders, the director, and his colleagues are engaged. In the work of the central farm, at Ottawa, seed selection has occupied a prominent place, as it is highly important that farmers in a new country should have some guide as to what are the best varieties to grow, and thus save the years of labour which would be involved in their having to find this out for themselves. As many as 107 varieties of oats were under trial in the test plots at Ottawa, last year, whilst 15 varieties have been discarded after trials extending over several seasons had shown them to be not worth the notice of cultivators. Two-rowed barley, six-rowed barley, fall wheat, spring wheat, peas, maize, turnips, mangels, sugar-beets, carrots, potatoes, and beans have been similarly dealt with, inferior varieties of seed being gradually eliminated and new varieties given a fair trial of some years' duration. The effects of ploughing-in green clover to act as a fertilizer—conveying into the soil the nitrogen which the clover plant is capable of obtaining from the atmosphere—were increases of 40 per cent. in the case of maize subsequently grown, and of 8 per cent. in the case of potatoes. In connection with the horticultural work at Ottawa a seeding apple orchard was begun last season, and 494 trees were planted,

most of them grown from seed of apples ripened at the station. It is hoped that from these seedlings a productive, hardy, late-keeping dessert apple of good quality will be obtained, as such a variety is much needed in Canada. Many new varieties of apples were obtained from different sources, some being root-grafted and others top-grafted. The American plums that have been procured are proving very useful, and there is now a large collection of named varieties growing in the orchard. A few sorts of great promise have already been obtained. New plantations have been made containing 111 varieties of currants, 218 varieties of strawberries, and 63 varieties of raspberries. A list has been drawn up of the best vegetables for farmers, embodying the results of five or six years' experiments. Trial crops of tobacco have ripened and cured well. The results of long-continued efforts to foster the cultivation of the awnless brome grass, *Bromus inermis*—not a native of England, but cultivated in this country under the name of Hungarian forage grass—in the more or less arid districts of the West, are regarded as most gratifying. Thousands of acres of valuable hay and grazing land are now being cultivated, where, but for this grass, there would be nothing but exhausted prairie. A study of the milking records of the dairy cows at Ottawa serves but to confirm conclusions already well established, such as that the percentage of butter-fat in milk, from morning or evening milking, is influenced by the comparative length of interval between the times of milking, that the richer milk is found to be produced after the shorter interval, and that where intervals between milking are equal, no appreciable difference appears to exist in either the quantity or quality of the milk drawn in the morning or in the evening.

From the estimate of the Government Statist it appears that the wheat crop of 1901-2 in VICTORIA has turned out even worse than was expected. The area harvested for grain is put at 1,753,164 acres, or 264,157 acres less than in the preceding year; and the yield, at barely seven bushels per acre, is reckoned to amount to only 12,113,712 bushels, or 5,860,186 less than the crop of 1900-1.

FOREIGN COUNTRIES.—In FRANCE the weather recently experienced has been the worst so far this season. The day temperatures have been abnormally low and night frosts have been common. All crops have suffered, but wheat and rye more so than oats. The wheats in many districts have turned yellow and are attacked by mildew. Rotation grasses are backward, and the prospects of the hay crop are not encouraging. Sugar-beets are satisfactory, except some of the later-sown crops. The Minister of Agriculture of the ARGENTINE REPUBLIC, in a statement communicated to the Minister of Foreign Affairs, says that foot-and-mouth disease has been non-existent in Argentina for many months. In the course of the last six months 630,000 cattle and one million sheep have been brought into Buenos Ayres for the consumption of the population without a single case of disease having been detected. During the same period Argentina exported to South Africa and Brazil more than 120,000 cattle and 28,000 sheep without the occurrence of any epizootic disease. The refrigerating establishments prepared in the same six months about 500,000 cattle and 2,500,000 sheep, which were all minutely inspected and found to be healthy. The Government declares that in the event of foot-and-mouth disease breaking out it would be the first to notify the fact by prohibiting the exportation of live-stock, being anxious to uphold the reputation of the principal source of Argentina's wealth. It is calculated that the farmers have more than five million young cattle ready for exportation.

Mr. Consul-General C. S. Smith, in his annual report on the agriculture of the ODESSA district, states that the harvest prospects for 1901, which were excellent, were not entirely fulfilled. In the district of Podolia and near Kieff the winter wheat was excellent, but the Dnieper district, which supplies the bulk of grain for South Russia, and contributes the largest part of its exports, was very unsatisfactory. The feature of the year was the crop of maize—which has never been equalled in South Russia, and enormous quantities were supplied for export. The following figures relate to the harvest for 1901 in the RUSSIAN EMPIRE:—The total area under cultivation was 219,070,401 acres, of which about 40 per cent. were under winter-sown crops, and 60 per cent. under spring crops. The yield of wheat was 11,463,576 tons, of rye 18,881,650 tons, of oats 8,919,695 tons, and of barley 5,143,388 tons. The result shows a decrease of 12 $\frac{1}{2}$ per cent. when compared with the harvest of 1900, and, for the whole Empire, must be considered as under average. The yield of oil-seeds was very poor during 1901. The British Consul at Novorossisk states that within the past three or four years the cultivation of the sunflower plant for the manufacture of oil-cake has been extensively adopted by the peasantry and farmers of the district. The industry, which it would appear is very remunerative, is rapidly increasing in proportions, and promises to still further develop before long. It is claimed that the sale of the oil-cake produced, in itself more than covers all the working expenditure of the mills. The stalks of the sunflower plant are used as fuel for driving the machinery, and the ash that remains gives from 25 to 30 per cent. of potash. Briefly speaking, it would appear that the sunflower seed when properly crushed gives 23 per cent. oil, 40 per cent. oil-cake, and 37 per cent. stalk. Writing on the culture of fruit in HOLLAND, M. Bellet, in the *Journal d'Agriculture Pratique*, states that the chief centres of the industry are the provinces of Zealand, Friesland, Drenthe, and Overijssel, where the commercial plantations amount in area to about 40,450 acres. About half the area is devoted to apples, and nearly one-fourth each to pears and cherries, plums covering only about 1,850 acres. In many of the orchards trees are grown alone, while in some gooseberries, currants, or raspberries are grown between and under the trees. The cultivation appears to be somewhat poorly managed. Planting is too thick; manuring is not judiciously carried out; the bark of the trees does not receive proper attention; and pruning is not done on the best system. The fruit is largely exported to Germany and England, partly in a raw state, and partly preserved in one way or another. The quantities sent to this country vary greatly. In one recent year we received only 52,000 bushels of apples from Holland, and in the next nearly 387,000 bushels, the range being from 23,000 to 134,000 bushels for pears, 34,500 to 149,500 bushels for plums, and 29,000 to 65,000 bushels for cherries. Considerable quantities of gooseberries and currants come to us from Holland, and a few strawberries.

LABOUR RETROSPECT.

UNITED KINGDOM.—The depression in the cotton industry continues, 16,000,000 spindles engaged in spinning yarn for the Manchester market, and employing 48,000 workpeople, having been working only four days a week for about two months. In the shipbuilding centres employment seems but moderately regular, and complaints continue about the absence of new work. In the iron and steel trades large orders are required to enable works to remain well employed, although branches affected by work for the Coronation were busy enough to warrant a curtailment of the Whitsun holidays.

Regarding the petition of employees in the Government dockyards for increased pay and improvement in conditions of labour, the Lords of the Admiralty have replied that they are unable to accede to the requests made. Shipwrights were reminded that their pay was increased in 1901, and the skilled and ordinary labourers were informed that no good reason had been shown for making any change, especially as 1s. advance was recently granted. A small concession was made to engine-fitter apprentices, and the draughtsmen's application is to be further considered. In future, in order to give the representatives of the various trades an opportunity of setting forth their requests, the several dockyards will be visited by officials of the Board of Admiralty regularly each year. The lock-out in the Stourbridge flint glass trade continues, both Messrs. Webb & Sons' and Messrs. Webb, Shaw & Co.'s glass houses being carried on by non-union labour. Mr. J. J. Rudge, the General Secretary, of Manchester, has invited all the manufacturers of the district, on behalf of the Society, to attend a meeting of masters and workmen to discuss the state of trade, and to consider suggestions for the development and improvement of the same.

COLONIES.—The State Premier of QUEENSLAND has despatched a letter to Mr. Barton on the subject of the pearl fisheries in Torres Straits, pointing out that the present aspect of things indicates the loss to Queensland of almost the entire pearling industry, owing to fishermen having licences from the Queensland Government being prohibited, under the recent Federal legislation, from employing alien labour for diving purposes. Negotiations have been on foot for the transference of several of the establishments to Meruka. A special agent has been despatched to report to the Ministry upon the position, and as to whether the exclusion of coloured divers will force those interested to become Dutch subjects in order to carry on the industry successfully. In VICTORIA, the unemployed question is becoming very serious, and petitions have been put forward for the establishment of labour bureaux in various centres. The Government are of opinion that the financial condition of the State does not allow of the starting of new public works. The Victorian Employers' Federation have issued a manifesto urging employers and capitalists to actively combat what they term "the experimental socialistic legislation" being forced upon them. Regarding the Factories Act, they say that while thoroughly in accord with factory laws dealing with sanitation, protection of life and limb, and like matters, they are distinctly opposed to undue Government interference in the fixing of wages and hours. They believe that the tendency of the so-called Conciliation and Arbitration Acts operating in New Zealand and New South Wales, and proposed to be introduced in Victoria, is to produce irritation rather than conciliation, and they call upon employers and producers to take joint action to ensure peace, security, and freedom from Government interference, so that both workman and employer may be left free to carry on their legitimate business.

On the subject of native labour, the report of the TRANSVAAL Chamber of Mines deals at some length, and what is reported is sufficient to remove all doubts of any serious difficulty being encountered in procuring an adequate supply in the future. An agreement has been entered into with the Government of SOUTHERN RHODESIA for the participation of mines of that country, if possible, to the extent of 12½ per cent. of the natives collected by the Association in the province of Mozambique. By this arrangement a uniform system of recruiting is secured, to the mutual advantage of the mines of both countries. The question of native wages was likewise dealt with, and a revised schedule was agreed upon, which will result in a material saving to the mines. At the same time, the rates fixed were reasonable, and will not, in the opinion of the committee, in any way interfere with the inflow of native labour. It is considered probable that, as the development of the industry proceeds, it will be necessary to go outside South Africa to complete the labour supply, and, with this contingency in view, representations were made to the High Commissioner with respect to recruiting in British East Africa Protectorate and the Uganda Protectorate, with a request for information as to the prospects of success in those quarters. So far as regards Zanzibar, the committee were advised that labour would be unobtainable.

INDIA.—The latest cable advices report an increase of 16,000 in the number on relief works and gratuitous relief, chiefly in Bombay Presidency. Persons relieved, however, are in a satisfactory condition. The increase in number is due to cessation of harvesting, and will continue until the monsoon bursts. Although prices show a tendency to rise, they are nowhere excessively high. Rain has been general, with quite a heavy fall in several districts of Burma and Bengal, but in Deccan and Central India only light. Mail advices from Madras say that the distress in Cuddapah is intensifying, crops having failed. Labour is also reported scarce. Work at the Kolar goldfields has been seriously interfered with by the drought, and practically all operations had to be suspended. The chairman of the Bombay Millowners' Association reported at the annual meeting that the prospects of the mill industry were more cheerful. The manufacture of yarn and cloth had been on a more extensive scale than in the previous year, when
